time as you can easily work, as the water might dilute the white and spoil the whole: then smooth and rub it with the pumice-stones, and with the small pieces of wood: wash it with a brush as you smooth it, and rub it over with a piece of new linen, which gives a fine lustre to the work.

4. The mouldings and carved work are cleaned with an iron; and the only thing to be attended to in the operation is not to raise the grain of the wood.

5. The subject thus prepared is ready to receive the colour you intend to give it. Choose your tint; suppose a silver colour. Grind white ceruse and Spanish-white separately in water, of each an equal quantity, and mix them together. Add a little indigo, and a very small quantity of finely-powdered charcoal; more or less of the one or other gives the tint you require. Dilute this tint in strong parchment-size; pass it through a bolting-cloth of silk very fine, and lay the tint on your work, taking care to spread it very equally; and then give it two layers, and the colour is applied.

6. Make a weak, beautiful, and clean, size; stir it till it cools; strain it through a fine cloth, and give two layers to the work with a soft painting-brush. Take care not to choke-up the mouldings, nor to lay-on the size thicker on one place than another, and spread it over the work very slightly, otherwise you will dilute the colours, and occasion undulations in the painting. The beauty of the work depends on this last sizing; for, if any part is omitted, the varnish will penetrate into the colours, and give it a darker shade.

7. When the sizing is dry, lay on two or three layers of spirit-of-wine varnish, taking care that the place on which you lay it be warm; and the work is finished.

Of King's White.—This derives its name from having been used in the apartments of the French king. It is in all respects conducted like the former, except that there is only a small quantity of indigo, to take the yellow from the white, without any black of charcoal, and without varnish. This white answers extremely well for apartments which are seldom used; but otherwise it spoils easily, especially in bedchambers. It is the best white where there is any kind of gilding; and in this case a little varnish is added.

OF HOUSE-PAINTING IN OIL-COLOURS.

To paint in oil is to apply to all sorts of subjects, as walls, wood, cloths, and metals, coloured earths ground and diluted in oil. By means of oil, the colours are longer preserved; and, not drying so speedily, they give the painter a longer time to smooth, finish, and re-touch, his work; the colours being more marked, and mixing better together, give more distinguishable tints, and more vivid and agreeable gradations, and the colouring is more delicate.

In every branch of painting in oil, as applicable either to churches, theatres, houses, or any other public or private buildings, or edifices, the general process will be found very similar; or with such variations as will easily be suggested by the judicious workman.

The first coatings, or layers, if on wood or iron, ought always to be of ceruse, or white-lead; the very best that can be obtained; which should have been previously ground very fine in nut or linseed oil, either with a muller, or, as that mode is too tedious for large quantities, it may be passed through a mill. If used on wood, as shutters, doors, or wainscoting, made of fir or deal, it is highly requisite to destroy the effects of the knots, which are generally so completely saturated with turpentine, as to render it, perhaps, one of the most difficult processes in the business to conquer. The best mode in common cases, is to pass over the knots with ceruse ground in water, bound by a size made of parchment, or some other animal substance. When that is dry, paint the knots with white-lead ground in oil, to which add some powerful siccativ, or dryer; as red-lead, or litharge of lead, about one-fourth part of the

the latter. These preparations should be done carefully, and laid very smoothly with the grain of the wood. When the last coat is dry, which will be in twelve or twenty-four hours, then smooth it with pumice-stone, or give the work the first coat of paint, prepared, or diluted, with nut or linseed oil. When that is dry, all the nail-holes or other irregularities on the surface should be carefully stopped with a composition of oil and Spanish-white, a whitening commonly known by the name of *putty*; but which is frequently made and sold at the shops of very inferior articles. When that is done, let the work be painted over again, with the same mixture of white-lead and oil, somewhat diluted with the essence of oil of turpentine, which process should be repeated not less than three or four times, if the work is intended to be left, when finished, of a plain white or stone colour; if of the latter, the last coat should have a small quantity of ivory or lamp black added, to reduce its whiteness a little; and this is also of service in preserving the colour from changing; a circumstance which the oil is apt to produce. But, if the work is to be finished of any other colour, either grey, green, &c. it will be requisite to provide for such colour, after the third operation, particularly if it is to be finished flat, or, as the painters style it, dead-white, grey, fawn, &c. In order to finish the work flatted, or dead, (which is a mode much to be preferred for all superior works; not only for its appearance, but also for preserving the colour and purity of the tint,) after the work, supposing it to be wood, has been painted four times in oil-colour, as directed in general cases, one coat of the flatted colour, or colour mixed up with a considerable quantity of turpentine, will be found sufficient; although in large surfaces it will frequently be requisite to give two coats of the flattening-colour to make it quite complete.

It must be observed, that, in all the foregoing operations, it will be requisite to add some sort of siccatif. A very general and useful one is made by grinding in linseed (or perhaps prepared oils, boiled, are better) about two parts of the best white copperas, which must be well dried, with one part of litharge of lead: the quantity to be added will much depend on the dryness or humidity of the atmosphere at the time of painting, as well as the local situation of the building. It is highly proper here to observe, that there is a kind of copperas made in England, and said to be used for some purposes in medicine, that not only does not assist the operation of drying in the colours, but absolutely prevents those colours drying, which would otherwise have done so by themselves. The best dryer for all fine whites, and other delicate tints, is *saccharum saturni*, or sugar-of-lead, ground in nut-oil; but which being very active, a small quantity, about the size of a walnut, will be sufficient for twenty pounds of colours, where the basis is ceruse. The greatest care should be taken to keep all the utensils, brushes, &c. particularly clean; or the colours will soon become very foul, so as to destroy the surface of the work. If this should so happen, the colour should be passed through a fine sieve, or canvas; and the surface of the work be carefully rubbed down with sand-paper, or pumice-stone; and the latter should be prepared by being ground in water, if the paint be tender, or recently laid-on.

The above may suffice as to painting on wood, either on outside or inside works; the former being seldom finished otherways than in oil, four or five coats are generally quite sufficient.

We shall now proceed to note what is requisite for the painting of new walls, or *stucco*, not painted before, and prepared for oil-colours. It does not appear that any painting in oil can be done to any good or serviceable effect in stucco, unless not merely the surface appear dry, but that the walls have been erected a sufficient time to permit the mass of brick-work to have acquired a sufficient degree of dryness: when stucco is on battened work, it may be painted over much sooner than when prepared as brick. Indeed, the greatest part of the mystery of

painting stucco, so as to stand or wear well, certainly consists in attending to these observations; for, whoever has observed the expansive power of water, not only in congelation, but also in evaporation, must be well aware that, when it meets with any foreign body obstructing its escape, as oil-painting for instance, it immediately refits it; forming a number of vesicles, or particles containing an acrid lime-water, which forces off the layers of plaster, and frequently causes large defective patches, extremely difficult to get the better of.

Perhaps in general cases, where persons are building on their own-estate, or for themselves, two or three years are not too long to suffer the stucco to remain unpainted; though frequently, in speculative works, as many weeks are scarcely allowed. Indeed, there are some nostrums set forth, in favour of which it is stated, in spite of all the natural properties of bodies, that stucco may, after having been washed over with these liquids, be painted immediately with oil-colours. It is true there may be instances, and in many experiments some will be found, that appear to counteract the general laws of nature; but, on following them up to their causes, it will be found otherwise.

Supposing the foregoing precautions to have been attended to, there can be no better mode adopted for priming or laying-on the first coat on stucco, than by linseed or nut oil, boiled with dryers, as before mentioned, and laid-on with a proper brush; taking care, in all cases, not to lay-on too much, so as to render the surface rough and irregular, and not more than the stucco will absorb. It should then be covered with three or four coats of ceruse, or white-lead, prepared as described for painting on wainscoting; letting each coat have sufficient time to dry hard. If time will permit, two or three days betwixt each layer will not be too long.

If the stucco be intended to be finished of any given tint, as grey, light-green, apricot, &c. it will then be proper, about the third coat of painting, to prepare the ground for such tint, by a slight advance towards it. Grey is made with ceruse; Prussian-blue, ivory-black, and lake, sage-green, pea and sea greens, with white; Prussian-blue and fine yellows, apricot, and peach, with lake; white, Chinese vermilion, and fine yellow, fawn colour, with burnt terra Sienna, or umber and white; olive-greens, with fine Prussian-blue and Oxfordshire-ochre.

We shall conclude with an account of some processes which have been recommended, on account of their cheapness, for preparing different materials for economical painting.

Of HOUSE-PAINTING with MILK.

This process was invented by A. A. Cadet de Vaux, of the Academical Society of Sciences in France; and first described in the *Feuille Cultivateur*, about the year 1798; then in the *Decade Philosophique*; and afterwards translated into some of our English journals. The following are the directions for preparing this paint: Take of skimmed-milk a pint, which makes two pints of Paris, or nearly two quarts English; fresh-slaked lime, six ounces, (about six and a half ounces avoirdupois;) oil of carraways, or linseed, or nut, four ounces; Spanish-white (whiting), three pounds; put the lime into a stone vessel, and pour upon it a sufficient quantity of milk to make a mixture resembling thin cream; then add the oil a little at a time, stirring it with a small spatula; the remainder of the milk is then to be added, and, lastly, the Spanish-white. Skimmed-milk in summer is often clotted; but this is of no consequence, because the contact with the lime soon restores its fluidity. But it must on no account be sour, because in that case it would form with the lime a kind of calcareous acetate, capable of attracting moisture. The lime is slaked by dipping it in water, out of which it is to be immediately taken, and left to fall in pieces in the air.

The choice of either of the above-mentioned oils is indifferent;

different; nevertheless, for white paint, the oil of caraways is to be preferred, because colourless. The commonest oils may be used for painting with the ochres. The oil, when mixed-in with the milk and lime, disappears, and is totally dissolved by the lime, with which it forms a calcareous soap.

The Spanish-white is to be crumbled, or gently spread on the surface of the fluid, which it gradually imbibes, and at last sinks; at this period it must be well stirred-in. This paint may be coloured like distemper (or size colour), with levigated charcoal, yellow ochre, &c. and it is used in the same manner.

The quantity here prescribed is sufficient for the first coat of six toises, or 27 square yards English. The price of this quantity amounts to nine sols, which reduces the price of the square toise to one sol six deniers, or three halfpence English.

One of the properties of this paint is, that it will keep for whole months, and requires neither time nor fire; in ten minutes we may prepare enough of it to paint a whole house. Another advantage is, that one may sleep in a chamber the night after it has been painted; for the milk-distemper paint dries in the space of an hour, and the oil which enters into its composition loses its smell and character of oil by its combination with the lime, which converts it into a true soap; the smell of this colour, when fresh laid-on, is like that of a soap-ley, or like that of a place in which linen is bleached. A single coating is sufficient for places that have already been painted. It is not necessary to lay-on two, unless where grease-spots repel the first coating; these should be removed by washing them with strong lime-water, or a ley of soap, or scraped off. New wood requires two coatings. One coating is sufficient for a staircase, passage, or ceiling.

To give this paint a greater degree of solidity, that it may be employed as a substitute for *oil-paint*, the author adds to the proportions of the paint for out-door works, of slaked-lime, oil, and white Burgundy pitch, each two ounces. The pitch is to be melted with a gentle heat in the oil, and then added to the smooth mixture of the milk and lime. In cold weather this mixture is to be warmed, that it may not occasion too-speedy cooling of the pitch, and to facilitate its union with the milk of lime. This paint, it is said, has some analogy with that known by the name of *encaustic*. It has been employed, the author informs us, for outside shutters formerly painted with oil; and is preferable to painting with lead objects that are exposed to putrid exhalations, which are apt to blacken paint composed of metallic matters, especially of lead.

M. Devaux recommends this kind of paint as a substitute for common white-wash, in lime-whiting (as it is called) the wards of hospitals, and the infected cottages of the sick. "As lime (the author observes) enters into the composition of my milk-paint, it may be made the base of it, by substituting it instead of the Spanish-white. The painting will become still cheaper by this substitution, on account of the cheapness of the lime, so that the toise of the painting will cost only five centimes; as to the labour, there can be no want of hands in buildings where great numbers of individuals are collected together, and where every thing ought to be conducted as economically as possible.

"But of what advantage, it may be objected, is the addition of milk and of oil? It is not by a chemist that this objection will be made; however this is our answer to it: The addition is made because lime has no adhesion to the walls; it cannot be applied in a thick layer; and the slightest contact causes it to come off; on which account walls whitewashed in the common way soil the clothes that come in contact with them. The caseous part of milk, the addition of the oil, which forms a saponaceous substance with the lime, afford, on the contrary, after the evaporation of the moisture, a layer that possesses density and cohesion, and is capable of receiving thickness; it is a coating, in some measure varnished,

which annihilates the porosity of stone, plaster, brick, or wood; and from which we may wipe off the dust without laying bare the place which has been painted.

"Milk-painting affords another advantage, which I have not mentioned in my memoir; namely, that of checking the nitrification of the walls, which is accelerated by painting in distemper. In fact, glue is an animal substance, of which one of the constituent principles is azot; now the decomposition of the glue extricates this azot, which is also one of the constituent principles of the nitric acid, and enables it to combine with the oxygen, with which it forms this acid. As milk-painting produces no extrication of azot, one of the aliments of the nitrification is removed. Moreover, this painting stops up the pores of the stone, and interposes itself between the walls and the nitrifying action.

"Supported by the theory which I have just explained, by the authority of two of our first chemists, Fourcroy and Deyeux, to whom I have submitted my opinion, and, lastly, by my own experience, I think myself justified in recommending to the administrators of hospitals, to adopt the *resinous milk-painting* (always substituting lime in the place of Spanish-white), as the most efficacious, and at the same time the most economical, means of destroying the mephitification of the walls, and preventing it for the future."

PAINTS prepared from FISH-OIL.

In the Trans. of the Society of Arts for 1805, a method is proposed by Mr. Vanherman, of Golden-square, for making cheap and durable paints with fish-oil. For this communication, Mr. V. received the silver medal and twenty guineas.

The paints thus prepared, beside their cheapness, are not subject to blister or peel off by exposure to the weather. They may be manufactured of any colour, and laid-on by ordinary labourers. The price of some of them is so low as twopence, and the highest does not exceed threepence, per pound, in a state fit for use. The author adds, that white-lead ground with prepared fish-oil, and thinned with linseed-oil, surpasses any white hitherto employed for resisting all weathers, and retaining its whiteness. The following is an account of his processes:

To refine one Ton of Cod, Whale, or Seal, Oil, for Painting; with the Cost attending it.

One ton of fish-oil, or 252 gallons,	-	£36	0	0
32 gallons of vinegar, at 2s. per gallon,	-	3	4	0
12 lbs. litharge, at 5d. per lb.	-	0	5	0
12 lbs. white copperas, at 6d. ditto,	-	0	6	0
12 gallons of linseed-oil, at 4s. 6d. per gallon,	-	2	14	0
2 gallons of spirits of turpentine, at 8s. ditto,	-	0	16	0
		£43	5	0

252 gallons of fish-oil,
12 ditto linseed-oil,
2 ditto spirit of turpentine,
32 ditto vinegar.

298 gallons, worth 4s. 6d. per gallon.
Which produces £67 1 0
Deduct the expence 43 5 0

£23 16 0 profit.

To prepare the Vinegar for the Oil.—Into a cask which will contain about forty gallons, put 32 gallons of good common vinegar; add to this 12 pounds of litharge, and 12 pounds of white copperas in powder; bung-up the vessel, and shake and roll it well twice a-day for a week; when it will be fit to put into a ton of whale, cod, or seal, oil; (but the Southern-whale oil is to be preferred, on account of its good colour, and little or no smell.) Shake and mix all together, when it may settle until the next day;

day; then pour off the clear, which will be about seven-eighths of the whole. To this clear part add twelve gallons of linseed-oil, and two gallons of spirit of turpentine; shake them well together, and, after the whole has settled two or three days, it will be fit to grind white-lead and all fine colours in; and, when ground, cannot be distinguished from those ground in linseed-oil, unless by the superiority of its colour.

If the oil is wanted only for coarse purposes, the linseed-oil and oil of turpentine may be added at the same time that the prepared vinegar is put in; and, after being well shaken up, is fit for immediate use, without being suffered to settle. The vinegar is to dissolve the litharge; and the copperas accelerates the dissolution, and strengthens the drying quality. The residue, or bottom, when settled, by the addition of half its quantity of fresh lime-water, forms an excellent oil for mixing with all the coarse paints for preserving outside-work.

All colours ground in the above oil, and used for inside-work, must be thinned with linseed-oil and oil of turpentine. The oil mixed with lime-water, is called *incorporated oil*.

Expense of the various Impenetrable Paints, and Method of preparing them.

1. *Subdued Green.*

Fresh lime-water, 6 gallons,	£0 0 3
Road-dirt finely sifted, 112 pounds,	0 1 0
Whiting, 112 ditto,	0 2 4
Blue-black, 30 ditto,	0 2 6
Wet blue, 20 ditto,	0 10 0
Residue of the oil, 3 gallons,	0 6 0
Yellow-ochre in powder, 24 pounds,	0 2 0
	£1 4 1

This composition will weigh 368 pounds, which is scarcely one penny per pound. To render the above paint fit for use, to every eight pounds add one quart of the incorporated oil, and one quart of linseed-oil; and it will be found a paint with every requisite quality, both of beauty, durability, and cheapness; and in this state of preparation does not exceed twopence-halfpenny per pound, whereas the coal-tar of the same colour is sixpence.

2. *Bright Green.*

112 pounds yellow ochre in powder, at 2d. per lb.	£0 18 8
168 ditto road-dust,	0 1 8
112 ditto wet-blue, at 6d. per lb.	2 16 0
10 ditto blue-black, at 3d. ditto,	0 2 6
6 gallons of lime-water,	0 0 6
4 ditto fish-oil prepared,	0 12 0
7½ ditto incorporated oil,	0 15 0
7½ ditto linseed-oil, at 4s. 6d. per gallon	2 8 9
592lbs. weight.	£7 15 1

This excellent bright-green does not exceed threepence-farthing per pound ready to lay on; and the inventor challenges any colour-man or painter to produce a green equal to it for eighteen-pence. After painting, the colour left in the pot may be covered with water, to prevent it from skinning; and the brushes, as usual, should be cleaned with the painting-knife, and kept under water.

A brighter green may be formed by omitting the blue-black; and a lighter green may be made by the addition of ten pounds of ground white-lead. A variety of greens may be obtained, by varying the proportions of the blue

and yellow. Observe that the wet-blue must be ground with the incorporated oil, preparatory to its being mixed with the mass.

3. *Stone Colour.*

Lime-water, 4 gallons,	£0 0 4
Whiting, 112 pounds,	0 2 4
White-lead ground in oil, 28 pounds, at 6d. per lb.	0 14 0
Road-dust, 56 pounds,	0 0 6
Prepared fish-oil, 2 gallons,	0 6 0
Incorporated-oil, 3½ gallons,	0 7 0
Linseed-oil, 3½ ditto,	0 15 9
Weighs 293lbs.	£2 5 11

The above stone-colour, fit for use, is not twopence per pound.

4. *Brown-Red.*

Lime-water, 8 gallons,	£0 0 8
Spanish-brown, in powder, 112lbs.	1 0 0
Road-dust, 224lbs.	0 2 0
4 gallons of fish-oil,	0 12 0
4 ditto incorporated-oil,	0 8 0
4 ditto linseed-oil,	0 18 0
Weighs 501lbs.	£2 0 8

This most excellent paint is scarcely one penny per pound.

A good chocolate-colour is made by the addition of blue-black in powder or lamp-black, till the colour is to your mind, and a lighter brown may be formed by adding ground white-lead.

Yellow is prepared with yellow ochre in powder, in the same proportion as the Spanish-brown. Black is also prepared in the same proportion, using lamp-black or blue-black.

5. *White.*—In a subsequent communication, Mr. Van-herman added the following receipt for a constant white for inside-painting. This paint, the author observes, is not entirely free from smell in the operation, but becomes dry in four hours, at the end of which time the smell is entirely dissipated.

“To one gallon of spirits of turpentine add two pounds of frankincense; let it simmer over a clear fire until dissolved; strain it, and bottle it for use. To one gallon of my bleached linseed-oil, add one quart of the above, shake them well together, and bottle it also. Let any quantity of white-lead be ground with spirits of turpentine very fine; then add a sufficient portion of the last mixture to it, until you find it fit for laying-on. If in working it grows thick, it must be thinned with spirits of turpentine. It is a flat or dead white.”

- Italy, roused by the Greeks to the cultivation of the arts, 213; excelled them, 214; landscape-painters, 252.
- John de Laer, a Dutch painter, 229.
- Julio Romano, deceived as to his own work, 242, 3.
- King's white, 254.
- Kneller, a successful painter during five reigns, 231.
- Laguerre, a French painter much employed in England, 231.
- Lambert, an English painter of landscape, 223.
- Landscape-painting, 251; practised by the Romans, but not by the Greeks, 251, 2.
- Laocoon, that performance criticised, 241.
- Le Brun, a famous painter, 229; head of the French school, 230.
- Le Sueur, a French painter of merit, 229; his hard fate, 230.
- Lely, Sir Peter, succeeds Vandyke in England, 231.
- Leonardi da Vinci, the great ornament of the Florentine school, 222; compared with Michael Angelo, 223.
- Lombard school, 226; second Lombard school, 227.
- Louis XIV. patronises the arts, 230.
- Loutherbourg, a battle and landscape painter, 233.
- Lucas Van Leyden, 227; his Last Judgment, 228.
- Ludius, a landscape-painter in the time of Augustus, 251.
- Malvasia, his notices of the revival of painting in Italy, 221.
- Maffaccio, an eminent artist of the school of Florence, 222.
- Mengs, a German painter, 229; his character of the French school, 230.
- Michael Angelo, 223; compared with Leonardo da Vinci, 223; with Raphael, 225; adored by Reynolds, 234; his style of drawing, 235.
- Mignard, curious anecdote of, 243.
- Milk-paint, for economical purposes, 255; its advantages, 256.
- Molyn, a Dutch landscape-painter, 252.
- Morland, his flying colours, 247.
- Mosaic-work known to the Arabians and Persians, 208.
- Moses, absurdly represented with horns on his head, 240.
- Muntz's method of encaustic-painting, 216.
- Naked figures, too common in painting, 241.
- Oil-painting not known to the ancients, 217; its advantages, 222; history of the discovery, 223; first practised in the Flemish school, 228.
- Opie, character of, 233.
- Outline, nature of, 234; its importance explained, 235.
- Pacuvius, a painter and poet, 212.
- Painters, line of, from Cosimo Roselli to Sir Joshua Reynolds, 234; qualifications requisite for a painter, 244; hints for the benefit of, 245; materials, 246, 253.
- Painting and poetry compared, 207; early use of painting, 207; Egyptian, 207, 8; Grecian, 208; forbidden to be practised by slaves, 210, 243; Roman, 212; held by them disgraceful, 213; revives in Italy, *ibid.* how far the skill of the ancients extended, 214; their different kinds of painting, as fresco, dry stucco, and encaustic, 215; colours used by the ancient painters, 217; how they applied them, 220; revival of painting, 221; schools of painting, 222; its encouragement hindered in England by the reformation, and still more by the rebellion, 231; principles and component parts of, 234; absurdities in painting, 240; it flourishes only in times of the highest civilization, 243; not yet admitted as a part of polite education, 245; defended in a moral view, 246; materials for, *ibid.* different kinds of, poetically described, 248; portrait-painting, 249; landscape, 251; architecture, 253; economical painting in water-colours, 253, 4; in oil, 254; with milk, 255; with fish-oil, 257; books on painting, *ibid.*
- Palladio, to be chiefly studied by architects and painters on architecture, 253.
- Pamphilus of Amphipolis, 210.
- Pananius, a very early Greek painter, 209.
- Parrhasius, his successful contest with Zeuxis, 210.
- Pastici, a peculiar kind of imitation, 243.
- Paul Veronese, skilful in drapery, 239; not in costume, 240; in architecture, 253.
- Pericles,

- Pericles, first encouraged painting with a national view, 245, 6.
- Persians, ancient, did not excel in painting, 208.
- Phidias, the Greek sculptor, 209.
- Pliny's account of the origin of painting, 207; of Egyptian painting, 208; of monochromatic painters, 209; of Grecian painters, 210, 111; Roman, 212, 251; encaustic-painting, 215.
- Polembourg, an ancient painter of the Dutch school, 228.
- Polycletus's rule, 247.
- Polygnotus, an early Greek painter, 209.
- Portrait-painting, 249.
- Poussin, the last great artist of Italy, 227; disliked the French style, 229; his landscapes, 252.
- Protagoras of Rhodes, 211; how highly honoured, 212.
- Purple of the ancients, 219.
- Raphael d'Urbino, founder of the Roman school, 224; compared with Michael Angelo, 225; his draperies, 238, 9; some improprieties of his pointed out, 240, 1; his portraits, 249.
- Rembrandt, the head of the Dutch school, 228; character of his paintings, 229, 237.
- Reynolds, sir Joshua, his remarks on antique painting, 214; on the qualifications of Michael Angelo, 223; of Louis Caracci, 227; of Rubens, 228; first president of the Royal Academy, and founder of the English school of painting, 232; excelled in portrait, 233, 249; and in historical painting, 233; his admiration of Michael Angelo, 234; not so attentive to correctness of outline as to general effect, 235; his colouring, 237, 247; his absurd representation of Mrs. Siddons, 240, 1.
- Richardson, a bad painter, but a good writer on the art, 231, 232.
- Romans, late in cultivating the arts, except the art of war, 212; held painting to be effeminate and disgraceful, 213; accordingly their artists were Greeks, 217.
- Rome, modern school of, 223, 228.
- Romney, an historical painter, 233.
- Royal Academy, foundation of, 232; said by some to have done no great service to the arts, 233.
- Rubens, the founder of the Flemish school, 228; employed in England, 231; his style of colouring, 236, 237; his anachronisms, 240.
- Salvator Rosa, an admirable landscape-painter, 252.
- Saxon painters, absurdities of, 240.
- Schools of painting, 222; can hardly be said now to subsist, 229; their characters distinguishable, 234.
- Sculpture, as practised by the ancient Greeks, 209; to a wonderful extent, 213; but, upon the revival of the arts in Italy, became subordinate to painting, 214, 5.
- Sheldrake's account of the painting of the Venetian school, 225, 6.
- Stucco-painting, dry, 255.
- Ten Kate, a Dutch painter, 249.
- Teniers, his pasticcis, or imitations of other masters, 243; fond of the grey tint, 247.
- Thornhill, sir James, the first English historical painter, 231; established a school for drawing, which, with that of Moser, led to the institution of the Royal Academy, 232.
- Timanthes, a Grecian painter, 210.
- Tintoretto, or Giacomo Robusti, 225.
- Titian, the head of the Venetian school, 225; compared with Rubens, 228; his colouring, 236; eminent in portrait, 249; his method of portrait-painting different from that of Rembrandt, 250; his landscapes, 252.
- Van Eyck, the probable discoverer of oil-painting, 223, 228.
- Vander Meulen, a battle-painter, 230.
- Vandyke, his great merit encouraged in England, 231; his style of colouring, 237; the excellence of his portraits, 249.
- Vanhorman's process for making paint with fish-oil, 256, 7.
- Vanmader's account of the rise of oil-painting, 223.
- Venetian school of painting, 225.
- Vernet, a French landscape-painter, 230.
- Verrio, patronised and over-paid by Charles II. 231.
- Vignola, an Italian architect, 253.
- Vitruvius, his mention of encaustic-painting, 215.
- Vouet, a French painter, 229.
- Water-colours for house-painting, 253; varnished, 254.
- Watteau, a painter of merit, 230.
- Wax-painting, 215.
- West, a great historical painter, 232, 233.
- Wilkie, an eminent living painter, *ibid.*
- Wilson, a very eminent landscape-painter, 233, 252, 3.
- Zeuxis of Heraclea, a distinguished Grecian painter, 210.

P A J

PAINTLICK, a town of the state of Kentucky: fourteen miles east-north-east of Stamford.

PAINTLICK CREEK, a river of Kentucky, which runs into the river Kentucky in lat. 37. 37. N. lon. 84. 43. W.

PAINTURE, *f.* [*peinture*, Fr.] The art of painting:

To the next realm she stretch'd her sway,

For *painture* near adjoining lay,

A plenteous province.

Dryden.

The showery arch

With lifted colours gay, or, azure, gules,

Delights and puzzles the beholder's eye,

That views the watry brede with thousand shews

Of *paintures* vary'd.

Philips.

PAINVILLE, a town of Virginia, with a post-office: 197 miles west of Washington.

PAJON' (Claude), a learned French protestant divine, was descended from a noble family, and born at Romorentin in the Orleanois, in the year 1626. Having made choice of the ministry for his profession, after receiving a preparatory education at his native place, he was sent to pursue his academical studies at Saumur, where he distinguished himself by his proficiency in the various branches of learning, as well as by an uncommon degree of penetration and sagacity in his academical exercises and persuasive powers of eloquence. Thus qualified, at the age of twenty-four he was admitted to the ministry, and became pastor of Marchenoir, in the little province of Duinois. While he continued at this place, the famous Jurieu, who was then settled at Mer, had entered into a controversy with a minister of the name of Buislot, who leaned somewhat towards the Arminian system, and addressed a letter written against him to M. Pajon. Repentful that our author did not enter into his views of the controversy, Jurieu turned his attack against him, and

accused the modifications under which Pajon exhibited some of the doctrines of the reformed church, of being erroneous and dangerous heresies. On the other hand, Pajon complained that his doctrine was either ill understood or wilfully perverted. In the mean time, he was elected to fill the chair of professor of divinity at Saumur. His complaints and declarations, however, instead of disposing his opponents to peace, served only to provoke them to renewed hostilities; and Jurieu wrote against him with his usual virulence, denouncing him as heterodox, and, from his station, a dangerous underminer of the true faith of the reformed church. M. Pajon defended himself against Jurieu and his party with learning and ingenuity, till at length the controversy between them became so warm, that he was cited before the synod of Anjou, in 1667, to give an account of his doctrine. In this assembly he disputed against his adversaries during several sessions with so much success, that he was dismissed without any censure, and permitted to retain his professorship. Afterwards, his enemies, becoming more powerful, procured a condemnation of his opinions to be passed, and the academy of Saumur obliged those students who applied for their testimonials to sign that condemnation. In these circumstances, perceiving that the Protestants, on account of the prejudices excited against him, declined sending their sons to study at Saumur, he was prevailed upon to resign his professorship, and to accept the vacant pastoral charge of the church of Orleans. Here he spent the remainder of his life, diligently occupied in the duties of his profession, and in writing a prodigious number of controversial and other treatises, which remain still in manuscript. He died in 1685, immediately before the revocation of the edict of Nantes, when he was in the sixtieth year of his age. As an author, he is principally entitled to notice for his excellent defence of the Protestant religion against father Nicole, entitled "*Examen*"

du Livre qui porte pour Titre, *Préjugez Légitimes contre les Calvinistes*, 1673, in 2 vols. 12mo. in which his learning, zeal, and judgment, are advantageously displayed. *Mohem's Hist. Eccl.*

PAJO'T (Louis Leo), Count d'Ansembray, a French nobleman, celebrated for his scientific knowledge, was born at Paris in the year 1678. He received the advantages of a liberal education; and, having early discovered an inclination for mathematical and philosophical studies, was intrusted in the philosophy of Des Cartes. Afterwards he took a tour to Holland, where he formed an acquaintance with Huygens, Ruysch, Boerhaave, and others distinguished by their eminence in literature and science. He was appointed director-general of the posts in France; and conducted the business of that department in such a manner as entitled him to the esteem of the public, and at the same time secured the confidence and favour of Louis XIV. That prince sent for him in his last illness to seal up his will, before it was sent to be deposited with the parliament. After the death of his father, the count came into the possession of a country-seat at Bercy, where he determined to establish a scientific museum; and he spared neither trouble nor expense to furnish it with curiosities of nature and art, and with philosophical and mechanical instruments and machines of every description. So famous did this collection become, that it induced Peter the Great of Russia, the emperor of Germany, and prince Charles of Lorraine, &c. to pay visits to the count d'Ansembray. It was perhaps the most curious museum in Europe; and was particularly unrivalled in articles connected with the science of mechanics. In this department of the mathematics, the count furnished several papers to the Memoirs of the Academy of Sciences, of which he was a member. The principal of them are, On an Instrument for the Measurement of Liquids; On an Aerometer, or Wind-gage; and, On a Machine for beating regular Time in Music. So much at heart had he the interests of science, that he bequeathed his museum to the academy, upon the condition that it should be rendered useful to the public. He died in the year 1753, at the age of seventy-five, deeply regretted by the poor parishioners of Bercy and St. Germain l'Auxerrois, to whom he was a most kind and liberal benefactor, and universally respected among his acquaintance for his integrity, humanity, and other excellent qualities. *Gen. Biog.*

PAJOU', a town of France, in the department of the Cantal: 2 miles from Aurillac.

PAIPARÆ'A, *f.* in botany. See GREWIA.

PAIR, *f.* [*paire*, Fr. from *par*, Lat.] Two things suiting one another; as, a pair of gloves, shoes, &c. A man and wife:

Oh! when meet now,
Such pairs in love and mutual honour join'd? *Milton.*

Baucis and Philemon there
Had liv'd long marry'd, and a happy pair;
Now old in love. *Dryden.*

Two of a fort; a couple; a brace.—The many pairs of nerves branching themselves to all the parts of the body, are wonderful to behold. *Ray.*

All his lovely looks, his pleasing fires,
All his sweet motions, all his taking smiles,
He does into one pair of eyes convey. *Suckling.*

PAIR is also used in compound things, for two parts alike to each other, though they only make one whole; as, a pair of scissors, snuffers, &c.

To PAIR, *v. n.* To be joined in pairs; to couple; as male and female.—Your hand, my Perdita; so turtles pair. *Shakespeare.*—To suit; to fit as a counterpart.—My heart was made to fit and pair with thine. *Rowe.*

Had our prince seen the hour, he had pair'd
Well with this lord; there was not a full month
Between their births. *Shakespeare's Wint. Tale.*

To PAIR, *v. a.* To join in couples:

Minds are so hardly match'd, that e'en the first,
Tho' pair'd by heav'n, in Paradise were curs'd. *Dryden.*

To unite as correspondent or opposite:

Turtles and doves with differing hues unite,
And glossy jet is pair'd with shining white. *Pope.*

To PAIR, *v. a.* [*pæran*, Sax. The original form of *impair*. Wicliffe uses *pairing* in the sense of *hurt*: "What profitith it to a man, if he wyne al the world, and do *pegyrynge* to his soul?" St. Mark, viii.] To impair:

No faith so fast, quoth she, but flesh does *paire*.
Flesh may empaire, quoth he, but reason can repaire. *Spenser.*

PAIR OF CARDS, *f.* [an old name for] A pack of cards.—A pair of cards, Nic'las, and a carpet to cover the table. Where's Sis'ly with her counters and her box? *T. Heywood's Woman killed with Kindness.*

PAIR-ROYAL, *f.* [at some games at cards] Three of a fort.

Each one prov'd a fool,
Yet three knaves in the whole,
And that made up a pair-royal. *Butler's Remains.*

PAIRA, a river of Persia, which loses itself in a lake near Tadvan, in the province of Farsistan.

PAIRAN', a town of Sibu, one of the Philippine Islands, inhabited chiefly by Chinese merchants and artificers.

PAIRIER, a town of France, in the department of the Vendée: ten miles south of Beauvoir.

PAIRUMBAU'CUM, a town of Hindoostan, in the Carnatic: thirty miles west of Madras.

PAIS, *f.* [Fr. country.] The people out of whom a jury is taken.—The subject of our next enquiries will be the nature and method of the trial by jury; called also the trial per *pais*, or by the country. *Blackstone.*

PAISAGE, *f.* [French.] A kind of landscape, the representation of some part of a country in painting. *Philips.*

PAISHA'WUR, a city of Candabar, and capital of a district, in Cabulistan, situated on the Kameh: 125 miles south-east of Cabul, and 170 north of Moultan. Lat. 33. 18. N. lon. 70. 36. E.

PAISLEY, a town of Renfrewshire, Scotland, situated about six miles and a half west of Glasgow, on the river White Cart, over which there are two stone bridges of two arches each, and one which consists of three arches. The town is very ancient; but was of much less consequence formerly than it is at present. No satisfactory etymology has hitherto occurred of the name *Paisley*. The following has been suggested by a good Gaelic scholar: A ridge of rocks that runs across the river, and forms a beautiful cascade, would, prior to the building of the town, be undoubtedly the most striking object that the place would present. The brow or face of a rock is in Gaelic *Pais-licht*. A church in front of the rock would be the church in *Pais-licht*. A church did stand here previous to 1160: it is named in the foundation-charter *Ecclesia de Paislet*, Latinized, in the records of the monastery, *Paistatum*, an easy derivative from *Pais-licht*, and in all probability the original of the modern *Paisley*.

Paisley was erected into a burgh of barony by James IV. in the year 1488, at that time probably deriving all its importance from the rich monastery which had been established there for several ages; for George Shaw, who was then abbot of that monastery, obtained this privilege from the king. Under this grant it enjoys all the privileges of a royal borough, except the right of being represented in parliament, and of sending delegates to the general convention at Edinburgh. The corporation or magistracy consists of three bailies, and seventeen counsellors, who are elected annually, besides a treasurer, town

town-clerk, and other inferior magistrates. The bailies are invested with the powers of justices of the peace; and take cognizance, in the first instance, of all offences committed within their jurisdiction.

At the commencement of the last century, Paisley is described as consisting only of one principal street, about half a mile in length, with a few narrow lanes branching out on either side. Now, however, it is an extensive and well-built town, and contains many excellent public and private edifices, especially in that part called the New Town, which stands on the eastern bank of the river Cart, and is laid-out with great regularity. The streets are in general well paved and lighted, and exhibit all the marks of opulence and industry, some of them being crowded with warehouses and manufactories, occupied by the merchants and tradesmen. The whole town is built of stone; and, in all the modern streets, the houses have squared and smooth free-stone fronts, in the same manner as those of Edinburgh and Glasgow.

A particular account of the abbey of Paisley would fill many pages; but the subject is very curious, since it is the most important remain of antiquity, not only in Paisley, but perhaps in the whole county of Renfrew, as having probably been the nucleus which determined the origin of the town. It was first founded as a priory for monks of the order of Clugni about the year 1160, by Walter, great-steward of Scotland. It was afterwards raised to the rank of an abbacy; and the lands belonging to it were by Robert II. erected into a regality, under the jurisdiction of the abbot. After the reformation, the abbacy was secularized by the pope in favour of lord Claude Hamilton, third son of the duke of Chatelherault, in reward of his steady adherence to the cause of queen Mary; and, in 1588, it was by the king and parliament erected into a temporal lordship, and Claude was created Lord Paisley. The revenues of the abbacy were very considerable: they consisted of the tythes of twenty-eight different parishes, with the property of the lordships of Paisley, of Kilpatrick in Dumbartonshire, and of Monkton in Ayrshire, extending each to a hundred merk land; and the forty-pound land of Glen in Lochwinnoch; with the lands of Achengown, Grange, &c. and a considerable detached property in different parts of the kingdom. All this property, with the patronage of the several churches, fell to lord Claude Hamilton, last abbot of Paisley. It continued in that family till 1563, when his grandson, James earl of Abercorn, sold the lordship of Paisley to the earl of Angus, who next year sold it to William lord Cochrane; he sold also Kilpatrick to sir John Hamiltoun of Orbistoun, Monkton to lord Bargenny, and Glen to lord Semple and others. Great part of the lordship of Paisley was at different times sold off by the family of Dundonald; and what remained of it was in 1764 re-purchased by the eighth earl of Abercorn. The fabric of the abbey owed much of its magnificence to abbot George Shaw, who about 1484 enlarged and beautified the building, surrounding the church, the precincts of the convent, the gardens, and a small deer-park, with a noble wall of hewn freestone. The abbey was, after the reformation, successively the seat of the earls of Abercorn and Dundonald. The late earl of Dundonald demolished the ancient gateway; and, by feuing-off the immediately-adjoining grounds for building, entirely changed the appearance of the place. As it was thus rendered totally unfit for a family-residence, it has since that time been let out into separate dwellings, and is now in a very mean and almost-ruinous state. The wall stood almost entire till 1781; when, the garden being feued-off for building upon by the late earl of Abercorn, the wall was sold to the feuers, and the stones of it employed in their houses.

The monks here are supposed to have been the authors of the *Chronicon Clugniense*, or Black Book of Paisley, as it is usually called, from the colour of its boards. This curious monument of antiquity is a chronicle of the pub-

lic affairs of Scotland during several centuries, and is frequently quoted by Buchanan. It was long in the possession of the president Spottiswood; after his death, it was carried into England by general Lambert, and was subsequently deposited in the king's library at St. James's.

The abbey-church, the only one which Paisley formerly required, was, when entire, a most noble building, and consisted of several distinct and separate places of worship. What now remains of this magnificent Gothic structure, is not yet unworthy the notice of the curious in antiquities. Mr. Pennant says, the great north window is a noble ruin, the arch very lofty, the middle pillar wonderfully light, and still entire; only the chancel now remains, which is divided into a middle and two side aisles, by very lofty pillars with Gothic arches; above these is another range of pillars much larger, being the segment of a circle; and surmounted by a row of arched niches from end to end, over which the roof ends in a sharp point. The outside of the building is decorated with a profusion of ornaments, especially the great west and north doors, than which scarcely any thing lighter or richer can be imagined.

Close by this church is the marquis of Abercorn's burial-place, the greatest curiosity in Paisley. It is a vaulted Gothic chapel, without pulpit, pew, or any other ornament; but has the finest *echo* perhaps in the world. When the end-door (the only one it has) is shut, the noise is equal to a loud and not very distant clap of thunder. If you strike a single note of music, you have the sound gradually ascending, with a great number of repetitions, till it dies away as if at an immense distance, and all the while diffusing itself through the circumambient air. If a good voice sings, or a musical instrument is well played upon, the effect is inexpressibly agreeable. The deepest as well as the most acute tones are distinctly reverberated, and these in regular intervals of time. When a musical instrument is sounded, it has the effect of a number of instruments of a like size and kind playing in concert. When a number of different instruments in unison sound the same note, a good ear is able to distinguish the variety of sound produced by each. A single instrument sounding a particular note, and then instantly its fifth, or any other concordant note, the two sounds can be heard as if were running into and uniting with each other in a manner peculiarly agreeable. But the effect of a variety of instruments playing in concert is particularly charming, and must excite such emotions in the soul as it is impossible to describe. In this chapel is the monument of Marjory Bruce, daughter of Robert Bruce, and mother of Robert II. Her story is singular: In the year 1317, when she was big with child, she broke her neck in hunting near this place: the Cæsarion operation was instantly performed, and the child taken out alive; but the operator chancing to hurt one eye with his instrument, occasioned the blemish that gave this king afterwards the epithet of *Blair-eye*; and the monument is also styled that of *Queen Bleary*.

The town of Paisley continued a part of the original or abbey-parish of Paisley till the year 1738; when, the magistrates and council having purchased the right of patronage from the then earl of Dundonald, a new church was built, and the town was erected into a separate parish. This is called the *Laigh Church*, is built in the form of a Greek cross, very well laid-out, and capable of containing a great number of people. In 1756 another church was built, upon a very extended plan, to accommodate its multiplied inhabitants; in which, though it is one of the largest in Scotland, yet the most distant of the congregation can hear with ease and distinctness; and, as it stands upon the highest part of the town, it was afterwards ornamented with a lofty and well-proportioned spire, visible at a great distance. This is called the *High Church*, and is a very fine building: it is an oblong square of 82 feet by 62 within the walls, built of free-stone well smoothed, having rustic corners, and an elegant stone cor-

nice at the top. In the construction of the roof (which is a pavilion covered with slate, having a platform covered with lead on the top), there is something very curious; and it is admired by every person of taste. In 1781, the number of the inhabitants still rapidly increasing, another church, called the *Middle Church*, was built, not quite so large as the former, but very handsomely and elegantly finished: and, in the following year, the town was divided and erected into three separate parishes, exclusive of the abbey-parish, and named according to their respective churches.

There are two large dissenting congregations in the town; those of the Antiburgher persuasion, and the Relief. The first of these has existed there for upwards of thirty years; the other is of a late date. There is, besides, a small congregation of Cameronians.

The edifices appropriated to public business, charity, or amusement, are all of modern erection. The hospital, or poor-house, was built in 1752, and is under the management of fifteen directors: it is a large structure, with an extensive garden attached, and is supported by a small assessment on the inhabitants at large. The town-hall is a handsome building of cut stone. The market is probably the neatest and most commodious range of shambles in Great Britain: the front is of hewn stone. No public theatre has yet been erected here; but there are rooms appropriated to concerts and assemblies. A large subscription-room, on the plan of the Glasgow tontine, has been erected within the last five years.

Paisley has attained its present rank and importance from its manufactures; and hence it seems proper to give a slight sketch of the rise, and of the progressive changes, which these have undergone at different periods since their first establishment. At the time of the union, and for some years after, scarcely any other goods were produced here but coarse linen checks, and a kind of striped cloths called Bengals; and even these were manufactured only on a very limited scale. When a free trade, however, was opened with England, the spirit of manufacture began to display itself at Paisley with a vigour seldom paralleled. This resulted in a great measure from the exertions of pedlars, or, as they are called in Scotland, *packmen*, many of whom, having accumulated a small capital, settled in this town and its vicinity, and became resident manufacturers. The experience of what would suit the taste of the people, and the connections they had established in the course of their travelling career, presented many advantages in their new occupation, of which they did not fail to avail themselves. They first improved the quality of the linen-cloths above-mentioned; but these in a few years gave way entirely to articles of a lighter and more fanciful description; such as linen gauze and lawns, both plain and ornamented. The manufacture of thread was introduced about the year 1750, and still continues to afford employment to a large portion of the inhabitants. In 1760, the manufacture of silk-gauze was begun by Mr. McKerral of Hillhouse, and soon displaced the linen-cloths as the staple-produce of Paisley. Before that period, the patterns and designs of all fancy-goods were made at Paris; but the Paisley manufacturers, disdaining the servility of imitation, established draughtsmen of their own, whose productions were thought not only to rival, but to excel, those of the French artists. Hence such a variety of elegant and richly-ornamented gauzes was issued from this town, as surpassed every thing that had hitherto appeared. Spitalfields was compelled almost to abandon the manufacture; and several companies came down from London to carry it on, on the banks of the Cart, where it flourished beyond any manufacture which any town of Scotland could boast of, till the invention of Arkwright's machinery for spinning cotton, by rendering fabrics of that material both cheap and elegant, almost excluded silks from any share in female dress, when it of course declined, and is now almost abandoned. Following the tide of fashion, the manufacturers of Paisley turned their exertions into the new channel, and soon

brought their cottons into competition with those of Manchester itself. The whole neighbouring waters were speedily occupied with spinning-mills and bleach-fields; and many thousand persons took up the employment of weaving cottons here and in the surrounding villages.

Besides these principal manufactures, Paisley has some others of a more local description, likewise conducted on an extensive scale: tan-works, and soap and candle works, are numerous; and there is also a calico-printing work, a copperas-work, and several manufactories for tape and ribbons.

The number of inhabitants in the town of Paisley amounted in 1695 to 2200; in 1755 they were 4290; in 1782, 11,100; and in 1792 they were 13,800. According to the parliamentary-returns of 1811, it contains 2951 houses, and a population of 36,785 persons, including the two suburb-parishes of Abbey, east and west.

Of the Roman camp mentioned by Camden, as situated close to Paisley, very few vestiges remain; the valla are nearly levelled, and the ditches filled up. Of the out-works no distinct marks are now visible, excepting of one which was constructed at a spot still bearing the name of Castle Head. A military road led to this entrenchment, which is supposed to have been the Vaudara of Ptolemy.

Elderlie, in the vicinity of this town, is noted, in the annals of Scotland, as the birth-place of the illustrious sir William Wallace. *Pennant's Tour in Scotland. Beauties of Scotland*, vol. iii. *Statistical Account of Scotland*, vol. vii.

PAITA. See PAYTA.

PAITAN', a town on the north coast of the island of Borneo. Lat. 6. 32. N. lon. 117. 28. E.

PAITLEY, or PATELEY BRIDGE, a small market-town in the parish and liberty of Ripon, in the west riding of Yorkshire, is situated on the river Nidd, at the distance of twelve miles west-south-west from Ripon. The market is held on Saturday, and here are four fairs annually. It is somewhat singular that this town is not named in any of our Gazetteers; neither is it mentioned in the late population-reports, though several townships in the same parish are there noticed. *Beauties of England and Wales*, vol. xvi.

PAITSEPON', a town of Little Bukharia: fifty miles east-north-east of Kashgar.

PA'KA, a town of Bohemia, in the circle of Koniggratz: eighteen miles north-north-west of Koniggratz. Lat. 50. 25. N. lon. 15. 22. E.

PA'KANG-GAY', a town of the kingdom of Birmah, on the Irawaddy: twenty-five miles south of Pegham-mew.

PAKASHASA'NA, one of the names of the Hindoo deity Indra, regent of the visible heavens.

PAKEFIELD, a village in Suffolk, about two miles from Lowestoff: this parish is bounded on the east by the German Ocean, which, by frequent dashing against the bases of the cliffs, has often received large portions of ponderous masses, together with the buildings they supported, into its voracious bosom. The trade consists only in a very small part of the herring-fishery. The church is dedicated to Margaret, and consists of two aisles built nearly uniform: the steeple stands at the west end of the south aisle, and contains five bells. The Quakers have had a meeting-house here for a hundred and thirty years past.

PA'KENHAM, a village in Suffolk: four miles east-north-east of Bury St. Edmunds.

PA'KIR, or PECHER, a sea-port town of Arabia, in the province of Oman. The inhabitants carry on a considerable commerce to India. The environs abound in cattle, grain, dates, raisins, and other fruits: 132 miles south-west of Hassek, and twenty-five east of Dofar.

PAKOL'TSZ, a town of the duchy of Warsaw: thirty-four miles north of Gnesna.

PAK'RATZ, a town of Sclavonia: twenty miles north-west of Pozzega.

PAKUP'ZKI, a town of Croatia, on the Kulpa: twenty miles east of Carlstadt.

PA'LA,

PA'LA, a town on the west coast of the island of Celebes. Lat. 2. 32. S. lon. 119. 9. E.

PALA'BROS, *f.* [Ital. on my word.] A kind of petty oath. *Shakespeare.*

PAL'ACE, *f.* [*palais*, Fr. *palatium*, Lat.] A royal house; an house eminently splendid:

The sun's bright *palace*, on high columns rais'd,
With burning gold and flaming jewels blaz'd. *Addison.*

The etymon of this word must be *Palatinum* or *Palatinus Ager*, where, according to Varro, the *Palatini*, or Aborigines, dwelt before the arrival of Æneas in Italy. *Palatinum* is a compound word, which includes the name of the country, *Latium*, with a prefix, which may signify *Purum Latum*, or *Præ-Latium*; "the very Latium," the principal or head place of the Latium. All other words collected in dictionaries as etymons are mere derivatives: we cannot therefore look upon the German and Saxon *palast*, or the Welsh and Cornish *plás*, as themata. (See Todd's Johnson.) It is clear that our word *place*, borrowed from the French, originates in *palatium*. *Etymological Gleanings*, MS.

Procopius derives the word from a Grecian called Palas, who gave his own name to a magnificent house he had built; adding, that Augustus, after him, gave the name *palatium* to the house of the Roman emperors on the hill which, for that reason, was called the *Palatine mount*. Others take it the contrary way; and say that Romulus's house, in which Augustus lived, was properly called *palatium*, because situate on the Palatine mount. Be this as it will, it is certain that *palatium*, from a proper name, in time became common to all houses of kings.

And, as the kings usually heard and determined causes in their houses, in what part of the realm soever they were situate; hence also *palatium* became a name for a court of justice, which usage is still retained. See the next article.

PAL'ACE-COURT, *f.* A court of legal jurisdiction, now held once a-week (together with the court of Marshalsea) in the Borough of Southwark. *Mason*.—Charles I. in the sixth year of his reign, by his letters-patent, erected a new court of record, called the *Curia Palatii*, or *palace-court*, to be held before the steward of the household and knight-marshal, and the steward of the court, or his deputy, with jurisdiction to hold pleas of all manner of personal actions whatsoever which shall arise between any parties within twelve miles of his majesty's palace at Whitehall. *Blackstone*.—For the distinction between the Marshalsea-court and the Palace-court, see the article LONDON, vol. xiii. p. 512.

PALA'CIOS, a town of Spain, in the province of Leon: eight miles south of Astorga.

PALA'CIOS, (Los), a town of Spain, in the province of Seville: ten miles south-east of Seville.

PALA'CIOUS, *adj.* [from *palace*.] Royal; noble; magnificent.—London increases daily, turning of great *palacious* houses into small tenements. *Graunt*.

PAL'ADA, a town of Hindoostan, in the circar of Aurungabad: forty-eight miles south-east of Aurungabad.

PAL'ADINE, *adj.* [*paladinus*, barb. Lat.] An epithet for a noble of eminent rank in the time of Charlemagne.—Such hath Orlando, Countie *Paladine*. *Harrington*.

PA'LÆ, anciently a town at the south of Corfica; now *St. Bonifacio*.

PALÆ'MON, or PALEMON, a sea-deity, son of Athamas and Ino. His original name was *Melicerta*; and he assumed that of Palæmon, after he had been changed into a sea-deity by Neptune. See MELICERTA.

PALÆ'MON (Quintus Remmius), a celebrated Roman grammarian in the reigns of Tiberius and Claudius, was a native of Vicenza, and domestic slave to a woman of that place; but, by attending her son to the academy, he acquired so much knowledge, that she gave him his

freedom, and he opened a grammar-school at Rome. He gained great reputation as a rhetorician and poet; but his morals were so loose, that he was considered a very improper preceptor for young people. His income, however, as teacher, was very considerable, but quite inadequate to his luxurious mode of living. The remains of this writer, who was so arrogant as to say that letters were born and would die with him, are, 1. *Ars Grammatica*, printed among the *Grammatici Antiqui*, of which the best edition is that of 1605. 2. *A treatise De Ponderibus et Mensuris*, printed at Leyden in 1587; but which has been ascribed to another writer of the same name. *Gen. Biog.*

PALÆOCAS'TRO. See THURIA.

PALÆOCH'ORI, or the OLD TOWN, otherwise called *Magoula*, the real site of the ancient city of Sparta. The New Town, under the name of MISITRA, (see vol. xv.) lies about two leagues west of it. *D'Anville*.—Mr. Chateaubriand visited this place in 1806, and describes the appearance of the ruins with great enthusiasm: "but this Magoula, formerly a considerable Turkish village, has also perished in this scene of desolation: its buildings are overthrown, and the index of ruins is itself but a ruin!" *Travels in Egypt, Palestine, &c. Paris, 1811.*

PALÆOL'OGUS (Michael), a very able man, who was governor of Asia under the emperor Theodorus Lascaris; and who, by various stratagems and cruelties, procured the empire for himself and his posterity.

PALÆP'APHOS, the ancient town of Paphos, in Cyprus, where stood a temple of Venus; and adjoining was the town called *Neo Paphos*, where St. Paul struck Elymas blind, and converted the proconsul Sergius Paulus.

PALÆPHARSALUS, the ancient town of Pharfalus, in Thessaly.

PALÆPH'ATUS. Of this name several ancient writers are recorded. One, an Athenian, placed among the poets anterior to Homer; one, a native of Paros or Priene, who lived under Artaxerxes Mnemon; and one, a grammarian and philosopher, born either at Athens, or in Egypt, posterior to Aristotle. Which of these is the author of a work remaining in the name of Palæphatus, is uncertain. It is in Greek, entitled *Περὶ τῶν Ἀπίστων*, *De Incredibilibus*; and its subject is the explication of ancient fables. It has been several times published in Greek and Latin: the best edition is that of I. F. Fischer, Lips. 1761, 1789. *Gen. Biog.*

PALÆP'OLIS, a town of Campania, built by a Greek colony, where Naples afterwards was erected.

PALÆSTE, *f.* The name of a Greek measure of length, being the same with the *doche* and *doron*, and containing four finger-breadths, or digits.

PALÆSTINUS, an ancient name of the river Strymon. *Lempriere*.

PALÆS'TRA, *f.* [Gr. from *παλν*, wrestling.] Among the ancient Greeks, a public building, where the youth exercised themselves in wrestling, running, playing at quoits, &c. The length of the *palæstra* was marked out by stadia, each equal to one hundred and twenty-five geometrical paces; and hence the name *stadium* was given to the arena whereon they ran.

Thefeus, according to Plutarch, is reported to have been the first who reduced wrestling into a science; and in process of time, though the rules which he laid down are unknown, it became one of the chief exercises of the olympic stadium, having been first introduced into it in the 18th olympiad; and Eurybalus, a Spartan, was the first who received the wrestler's crown. The most remarkable difference between the ancient and modern practice of this art is, that the ancient wrestlers contended naked, and that their bodies were rubbed all over with oil, or with a certain ointment, composed of a due proportion of oil, wax, and dust, mixed up together, which they called *ceroma*. In order, however, to qualify the extreme lubricity of the skin, occasioned by this unction, the athletes were accustomed, before they came to an engagement,

ment, either to roll themselves in the mud of the palæstra (from which some persons derive the words *palæ* and *palæstra*, *πηλος* signifying mud), or in the sand kept for that purpose, or that with which the place of combat seems to have been covered. It is certain, whatever was the mode of doing it, that the athlete, who were anointed, were always, before they engaged, sprinkled with dust or sand; so that to say an athlete gained a victory, *ἀνίκητος*, and without being so sprinkled, was the same thing as to say he gained a victory without engaging; which indeed sometimes happened, when, either from the great reputation of the champion, or other reasons, none appeared to encounter him. The office of anointing and sprinkling the combatants was sometimes performed by themselves upon one another, and sometimes by the officers of the palæstra, called from thence *αἰπταί*, or anointers.

After the wrestlers were thus prepared for the engagement, they were matched by the judges or presidents of the games in the following manner. In a silver urn consecrated to Jupiter, and brought forth upon this occasion, were cast so many lots or dice, about the bigness of a bean, as answered to the number of competitors. These lots were all marked with letters; as for example, upon two of them was written the letter A, B upon two others, and so on in alphabetical order. This being done, the athletes approached in order, and, invoking Jupiter, put their hands into the urn, and drew out each his lot: to prevent all fraud, an officer appointed for that purpose attended upon every one as he came to draw, and held up his hand before him, to hinder his seeing the letters written upon the lot. When every one had drawn, the presidents of the games, going round to every athlete in order as they stood, inspected the lots. And thus the two, whose lots were both marked with the same letter, as with A or B, were by him matched and appointed to engage with each other. This was the case when the number of the combatants was even, as four, eight, twelve; but, when the number was odd, as five, seven, nine, &c. there was put into the urn, together with the duplicate lots, an odd one, marked with a letter to which there was none that corresponded. The athlete who was fortunate enough to obtain this lot was named *ephedrus*, was to wait till the others had contended, and was then to take up one of the conquerors. This, as Lucian observes, was a very considerable advantage; as the champion, who by virtue of his lot was to wait till the others had contended, came fresh and vigorous to the encounter against an adversary, animated indeed and flushed with conquest, but shattered and exhausted in obtaining it.

The wrestlers, being thus matched, proceeded to the combat, in which the victory was adjudged to him who gave his adversary *three falls*. This seems to be evident, from the famous epigram upon Milo, with which we shall conclude this article.

The champion who distinguished himself the most in this exercise, was Milo of Crotona, who gained no less than six Olympic and as many Pythian crowns. There are so many instances of the prodigious strength of this famous wrestler, and most of them so well known, that it would be endless and impertinent to cite them all. (See *Milo*, vol. xv.) This Milo, to give a proof of his astonishing strength, was wont to take a pomegranate, which, without squeezing or breaking it, he held so fast by the mere strength of his fingers, that nobody was able to take it from him; "nobody but his mistress," says Ælian. But, however weak he may have been with regard to the fair sex, his superior force was universally acknowledged by the men, as will appear by the following epigram:

When none adventur'd, in th' olympic sand,
The might of boist'rous Milo to withstand;
Th' unrivall'd chief advanc'd to seize the crown,
But, 'mid his triumph, slipp'd unwary down.

The people shouted, and forbade bestow
The wreath on him who fell without a foe.
But, rising, in the midst he stood, and cry'd,
Do not *three falls* the victory decide?
Fortune indeed hath giv'n me *one*, but who
Will undertake to throw meth' *other two*? *Wesli's Pindar.*

PALÆSTRIC, *adj.* Belonging to bodily exercise.—They were so skilled in the *palæstric* art, that they slew all strangers whom they forced to engage with them. *Bryant's Analysis of Anc. Myth.*—Gentlemanly and *palæstric* exercises should be somewhat encouraged. *Life of a Dissenting Minister*, 1812.

PALÆSTROPHYLAX, *f.* The director of a palæstra, and of the exercises performed therein.

PALAFOX' Y MENDOZA (Don Juan de), a Spanish prelate, was born of a noble family at Arragon, in the year 1600. He studied at Salamanca, after which he was appointed a member of the council of war, and next to that of the Indies; but he renounced civil distinctions for the ecclesiastical state, and was made a bishop in Spanish America, with the title of judge of the administration of the three viceroys of the Indies. Zeal for the interests of the church involved him in some difficulties, and he was compelled to secrete himself to save his life. His conduct was however in every respect approved by the king; and he was appointed to the bishopric of Osma in 1653, in which he continued till his death, in 1656. He was a voluminous writer; but the works by which he is chiefly known, are, *The History of the Siege of Fontarabia*, and *The History of the Conquest of China by the Tartars*.

PALAFU'GELL, a town of Spain, in Catalonia: twenty miles south-east of Gerona.

PALAGONIA, a town of Sicily, in the Val di Noto.

PALAI'S (Le), a seaport town of France, and capital of the island of Belle-Île, situated on the east coast, and defended by a citadel, with good anchoring in the road; but vessels of above fifteen tons cannot enter except at high-water. It contains two churches, and about 500 houses: twenty-four miles south-east of L'Orient. Lat. 47. 21. N. lon. 3. 4. W.

PALAI'S (St.), a town of France, in the department of the Lower Pyrenees, and chief place of a canton, in the district of Mauléon, seated on the Bidouze; twenty-one miles south-east of Bayonne. The town contains 1000 inhabitants. Lat. 43. 19. N. lon. 0. 50. W.

PALAISEAU'X, a town of France, in the department of the Seine and Oise: seven miles south-east of Versailles.

PALA'KA, a town of Turkish Armenia, in the government of Kars: sixty miles north-north-east of Kars.

PALAMA'DA, a town of Bengal: twenty-eight miles south of Doesa.

PALAMBANG', or **PALEMBANG**, a town of the island of Sumatra, situated on a river of the same name, about fifty miles from the sea; the capital of a kingdom, of which the dominions are extensive, and comprehend the island of Banca. Palambang is peopled mostly by Javans, in consequence of that part of the island being formerly under the jurisdiction of the Bantam empire, whence its sovereigns derived their appointment. It has been since under the immediate protection of the Dutch government at Batavia, who have had a chief and factory there, and procure from it pepper and tin. It has likewise been an useful mart to them, for vending opium and other commodities from the west of India. The tin, though exported from Palambang, is dug up in the island of Banca, which covers the mouth of the river, and constitutes a trade of considerable importance. The king of Palambang, whose dominions are very extensive, reaching as far as the hills of Lampooon to the southward, and comprehending the island of Banca, accumulates immense riches. It is said that the quantity of pepper brought annually from Palambang is about 2,000,000 lbs. which is

PALAMEDEA AND PANAX.

Chinese Ginseng.

The Horned Grebe.

Monogram of the printer Palmer.

is purchased at the rate of two stivers per lb. The Dutch company likewise take about 1000 carats of rough diamonds, and a considerable quantity of canes and rattans. For these commodities, a large sum in specie is yearly required to balance with the king. In 1771 the Dutch company rebuilt there an old ruined fort, in a pentagonal form, at the charge of about 7322l. sterling. Lat. 2. 50. S. lon. 104. 59. E. *Marsden's Sumatra. Stavorinus's Voyage*, vol. i.

PALAMBU'AN. See BALAMBUAN.

PALAMCOT'TA. See TINEVELLY.

PALAMEDE'A, *f.* the SCREAMER; in ornithology, a genus of birds of the order grallæ, of which the generic characters are—Bill conic, the upper mandible hooked; nostrils oval; feet four-toed, cleft, a very small membrane connecting the toes at the root. There are only two species of this genus; both natives of South America.

1. *Palamedea cornuta*, the horned screamer: wings with two spines at the bend; the front is horned; hence its specific name.

Amidst the discordant sounds of the aquatic birds and croaking reptiles of the marshes of Guiana, there is heard, at intervals, a powerful note which drowns the rest, and rebellow from the distant shores: it is the deep and tremulous voice of the screamer, a large dusky bird, distinguished by the singularity of its armour. On its head stands a pointed horn, three or four inches long, and two or three lines in diameter at the base: this horn, which is inserted on the top of the forehead, rises straight, and terminates in a sharp point bent somewhat forward; near the base it is sheathed like the quill of a feather. Besides the horn which grows out of the head, it has in each pinion two spurs, which project forward when the wing is closed. These spurs are the apophyses of the metacarpal bone, and rise from the anterior part of these extremities; the upper spur is largest, of a triangular form, two inches long, and nine lines broad at the base, somewhat curved, and terminating in a point; it is also invested with a sheath of the same substance at the base of the horn. The lower apophysis of the metacarpal bone is only four lines long, of the same breadth at its origin, and similarly sheathed. With this furniture of offensive arms, which would render it formidable in combat, the screamer never attacks other birds, but wages war only against reptiles. It seems even to have a gentle and feeling disposition; for the male and female keep constantly together. Love binds their affections by an indissoluble chain: if one happens to die, the survivor can hardly support the loss of its companion; it wanders, perpetually moaning, and consumes the wretched remainder of its life near the scenes of tender recollection, and of past joys.

If the affectionate character of this bird forms a contrast to its mode of life, a like opposition obtains in its physical structure. It subsists on prey, and yet it has the bill of a granivorous bird; and, notwithstanding its spurs and its horn, the head resembles that of a gallinaceous bird. Its legs are short, but its wings and tail are long; the upper mandible projects over the lower, and bends somewhat at the point; the head is clothed with small downy feathers, bristled and crisped, intermixed with black and white; the same curled plumage covers the top of the neck; the lower part is covered with broader thicker feathers, black at the edge, and grey within; the mantle is brownish-black, with greenish reflections, and sometimes mixed with white spots; the shoulders are marked with rufous, and that colour extends on the edge of the wings, which are spacious; they reach almost to the end of the tail, which is nine inches long. The bill is two inches long, eight lines broad, and ten thick at the base; the leg joins to a small naked part of the thigh, and is seven inches and a half high; it is covered with a rough and black skin, whose scales are strongly marked on the toes, which are very long; the middle

one, including the nail, is five inches, and the nails are half-hooked, scooped out below; the hind nail is slender, almost straight, and very long. The total length of the bird is three feet: we could not perceive the great difference, in point of size, noticed by Marcgrave, between the male and female. They appear to be nearly of the magnitude of the turkey-cock.

Willughby justly remarks, that nature has bestowed extraordinary qualities on this bird; the horn, which projects from its head, would alone discriminate it from the whole class of birds. Barrere was mistaken, therefore, in ranging it with the eagles; since it has neither their bill, their head, nor their feet. It builds its nest in the form of an oven, at the foot of some tree; it walks with its neck erect and its head lofty, and haunts the forests; but it is mostly found searching for its prey in the savannas. It lays two eggs, the size of those of a goose; yet in this authors differ. Bacon says also, that it makes the nest both in thickets, at some distance from the ground, and often among the rushes. Fermin tells us, that it builds on high trees. The young are brought up in the nest till able to shift for themselves: they have but one nest in the year, which is in January or February, except the first eggs are taken, in which case they make a second in April or May. The young birds are frequently eaten by the natives, though the colour of the flesh is very dark; that of the old ones is tough and ill-tasted. By some authors, this species is said to feed on crabs and birds, such as pigeons, poultry, &c. and even to attack sheep and goats; but this is denied by others, who say that its principal food is reptiles. In the stomach of one which M. Bajon dissected, there were only found herbs and seeds of plants; however, he adds that the bird has no gizzard. This is a rare species, found hitherto only in certain districts in Guiana, Surinam, and other parts of South America, chiefly in the marshes and wet savannas, and for the most part near the sea. These seem to be the birds mentioned by Ulloa, which are called, by the inhabitants of Quito, *dispertadores* or awakeners, from their giving notice to others of the approach of danger; as, on hearing the least noise, or seeing any one, though at a great distance, they rise from the ground, and make a loud screaming noise, hovering over the object which caused the alarm, whereby the rest of the birds, taking the hint, are able to escape impending danger. This screaming noise, which some authors relate as being exceedingly loud and terrible, occasioned Mr. Pennant to give the genus the name it bears. In the Hunterian Museum there is a fine specimen of this bird, brought from Cayenne. See the annexed Plate, fig. 1.

2. *Palamedea cristata*, the crested screamer: a crest instead of a horn; no spines at the wings. This (doubtful) species is about the size of a heron. The bill is short, bent like that of a bird of prey, and of a yellowish-brown; irides gold colour. On the forehead, just above the bill, is a tuft of black feathers, variegated with ash-colour: the head, neck, and body, are grey, mixed with rufous and brown, most inclining to the last on the wings and tail; the legs are pretty long, and of a dull-yellow: claws brown; the hind toe is placed high up, so as not to touch the ground in walking. This bird inhabits Brazil. Linnæus places it in the screamer genus, perhaps for its cry, for it is said to be heard far off. None of our later writers seem to have seen it, all of them relying on Marcgrave, both for description and figure. It is said to feed on the same food as the heron tribe: the flesh is good, and the bird by some kept tame.

PALAMEDES, a Grecian chief, son of Nauplius, king of Eubœa. He was sent by the Greek princes who were going to the Trojan war, to bring Ulysses to the camp; who, to withdraw himself from the expedition, pretended infamy; and the better to impose upon his friends, used to harness different animals to a plough, and sow salt instead of barley into the furrows. The deceit was soon perceived by Palamedes; he knew that the regret to part

from his wife Penelope, was the only reason of the pretended insanity of Ulysses; and, to demonstrate this, Palamedes took Telemachus, whom Penelope had lately brought into the world, and put him before the plough of his father. Ulysses showed that he was not insane, by turning the plough a different way not to hurt his child. This having been discovered, Ulysses was obliged to attend the Greek princes to the war; but a mortal enmity arose between Ulysses and Palamedes. The king of Ithaca resolved to take every opportunity to distress him, and, when all his expectations were frustrated, he had the meanness to bribe one of his servants, and to make him dig a hole in his master's tent, and there conceal a large sum of money. After this Ulysses forged a letter in Phrygian characters, which king Priam was supposed to have sent to Palamedes. In the letter the Trojan king seemed to entreat Palamedes to deliver into his hands the Grecian army, according to the conditions which had been previously agreed upon, when he received the money. This forged letter was carried by means of Ulysses before the princes of the Grecian army. Palamedes was summoned, and he made the most solemn protestations of innocence; but all was in vain; the money that was discovered in his tent served only to corroborate the accusation: he was found guilty by all the army, and stoned to death. Homer is silent about the miserable fate of Palamedes; and Pausanias mentions that it had been reported by some that Ulysses and Diomedes had drowned him in the sea as he was fishing on the coast. Philostratus, who mentions the tragical story above related, adds, that Achilles and Ajax buried his body with great pomp on the sea-shore, and that they raised upon it a small chapel, where sacrifices were regularly offered by the inhabitants of Troas.

Palamedes was a learned man as well as a soldier: and to him are ascribed the invention of weights and measures; the art of drawing up a battalion; the regulation of the year by the course of the sun, and of the month by that of the moon; likewise the games of dice, and even chess, are ascribed to him. Pliny affirms that during the siege of Troy he invented the four letters in the Greek alphabet θ , ξ , ϕ , χ ; but Philostratus ascribes to him only the ν , ϕ , and χ .

PALAMI'DA, a fortress of Sicily, on the north-west coast, in the valley of Mazara: fourteen miles west of Palermo.

PALAMOS, a seaport town of Spain, in Catalonia, situated on the coast of the Mediterranean, fortified, and defended by a citadel: twenty-two miles south-east of Gerona. Lat. 41. 50. N. lon. 2. 58. E.

PALAMO'W, a circar of Bengal; bounded on the north by Bahar, on the east by Koondah, Toree, and Nagpour, on the south-east by Burwah, on the south-west by Sirgooja, and on the west by Bittounga; about eighty miles long, and forty in its main breadth. Palamow, the capital, is 120 miles south-south-west of Patna, and 230 west-north-west of Calcutta. Lat. 23. 48. N. lon. 84. 20. E.

PALAMPONG', a town on the west coast of the island of Leyta. Lat. 10. 58. N. lon. 124. 14. E.

PALA'NA, a town of Peru, in the audience of Quito: fifty miles south of Loxa.

PALA'NA, a town on the west coast of the island of Lucón, at the entrance of Caiguran Bay. Lat. 16. 45. N. lon. 122. 14. E.

PAL'ANDER. See **PALENDER**.

PALAN'DO, a town of South America, in the province of Quito: forty-five miles south of Loxa.

PALA'NE, a river of Africa, which runs into the Indian Sea near Mozambique.

PALAN'KA, a town of European Turkey, in Bulgaria: forty miles south of Sophia.—Another in Bessarabia, on the Dneister: thirty-two miles north-west of Akerman, and forty south-east of Bender.

PALAN'KA, a castle of Hungary: twenty-two miles north-east of Gran.

PALAN'QUE, *f.* [French.] A kind of fortification so called in Hungary. It is made of stakes driven into the ground, interlaced with twigs, and covered with earth; and serves to stop the progress of an advancing enemy. *James's Mil. Dict.*

PALANQUIN, *f.* [Ind. *palkee*.] At first called by us *palanke*. "They ride on men's shoulders in a slight thing they call a *palanke*, made somewhat like a couch or standing pallat, covered with a canopie, wherein a man may lie at his full length." Terry's Voyage to East-India, &c. 1655.] A kind of covered carriage used in the eastern countries, supported on the shoulders of four men, and wherein persons of distinction are carried.—He appeared with all the pomp known among a simple people, being carried in a sort of *palanquin* upon the shoulders of four men. *Robertson*.—A kind of bier.—The little *palanquin*, into which they put the corpse, is carried by his kindred. *Hist. of the Kingdom of Macassar*, 1701.

PALANTO'NE, a town of Italy: twelve miles north-west of Ferrara.

PALA'NY, a town of Hindoostan, in Bahar: seven miles south-east of Bahar.

PALAN'ZA, a town of Italy, on the west side of Lake Maggiore: fifteen miles south-east of Domo d'Ossello.

PALA'OS. See **NEW PHILIPPINES**.

PALAPET'TY, a town of Hindoostan, in the province of Dindigul: eighteen miles north of Dindigul.

PALAPOU'R, a town of Bengal: twenty-two miles east of Boglipour.

PALAPRAT' (John), a poet and dramatic writer, was born at Toulouse in the year 1650. He distinguished himself from his youth by a talent for poetry, and obtained several prizes at the Floral games of that city. He was brought up to the legal profession, and obtained some offices of consideration, in which he conducted himself with great credit. At length an attachment to literature gave him a distaste for business; and Paris became his principal abode. In 1691, the duke of Vendome attached him to his person in quality of secretary. He employed himself, at Paris, chiefly in theatrical compositions; and he contracted an intimacy with the abbé Brueys, in concert with whom he wrote several pieces for the stage, of the comic class. It is to their mutual credit, that their friendship continued unchanged by envy till death. Of their conjunct performances, three have kept their place on the stage, together with one of his sole composition. He also wrote eight discourses on different subjects, and published a volume of poems, mostly addressed to M. de Vendome. The character of his works is gaiety and vivacity, with an air of simplicity, but with little regard to correctness. His dramatic pieces are contained in the collection of those of Brueys. Palaprat died at Paris in 1721, at the age of seventy-two.

PALA'RIA, *f.* Among the Romans, a kind of exercise performed at a stake by the soldiers. The stake being fixed immovable in the ground, and six feet high above it, the young undisciplined soldiers advanced against it armed with a hurdle and cudgel, instead of a shield and sword, and went through all the rules of attack and defence, as if actually engaged with an adversary. Sometimes they stood at a distance, and attacked it with misfiring weapons, at the same time using all the requisite motions for defending themselves, and warding-off what might be thrown against them.

PALASBA'RY, a town of Bengal: six miles north-north-east of Goragot.

PALASBO'NA, a town of Bengal: sixteen miles south of Rajemal.

PALASCO, a town of the island of Corsica: fourteen miles north of Corte.

PALAS'Z, a town of European Turkey, in Servia: fifteen miles south-west of Belgrade.

PAL'ATABLE, *adj.* [from *palate*.] Gustful; pleasing to the taste.—There is nothing so difficult as the art of making advice agreeable. How many devices have been made

made use of to render this bitter potion *palatable*! *Addison*.

They, by the alluring odour drawn in haste,
Fly to the dulcet cates, and, crowding, sip
Their *palatable* bane.

Philips.

PALAT'CHA, or PALATSA, a town of Asiatic Turkey, in Natolia, situated near the coast of the Archipelago. It is eight miles north of Milet, and twenty-one south of Scalanova. Lat. 37. 31. N. lon. 27. 12. E.

PALAT'CHY, a town of Hindoostan: fifteen miles south of Coimbetore.

PAL'ATE, *f.* [*palatum*, Lat.] The instrument of taste; the upper part or roof of the mouth.—Light and colours come in only by the eyes; all kind of sounds only by the ears; the several tastes and smells by the nose and *palate*. *Loeke*.

By nerves about our *palate* plac'd
She likewise judges of the taste;
Else, dismal thought! our warlike men
Might drink thick port for fine champagne.

Prior.

The vulgar boil, the learned roast, an egg;
Hard task to hit the *palate* of such guests.

Pope.

Mental relish; intellectual taste.—It may be the *palate* of the soul is disposed by listlessness or sorrow. *Taylor*.—The men of nice *palates* could not relish Aristotle, as dress'd up by the schoolmen. *Baker on Learning*.

To PAL'ATE, *v. a.* To perceive by the taste.

He merits well to have her, that doth seek her
(Not making any scruple of her soileure)
With such a hell of pain, and world of charge;
And you as well to keep her, that defend her
(Not *palating* the taste of her dishonour)
With such a costly loss of wealth and friends. *Shakespeare*.

PALA'TIAL, *adj.* [from *palatum*, Lat.] Befitting a palace; magnificent.—A magnificent structure, said to have been a monastery: I rather suppose it to have been the grand-commanderie of the island, for it is built in the *palatial* stile of those days. *Drummond*.

PALAT'IC, *adj.* [from *palate*.] Belonging to the palate or roof of the mouth.—The three labials, *p*, *b*, *m*, are parallel to the three gingival, *t*, *d*, *n*, and to the three *palatine*, *h*, *g*, *l*. *Holder*.

PALATINATE, *f.* [*palatinatus*, Lat.] A province or signory possessed by a palatine, and from which he takes his title and dignity.

The palatinates now subsisting, are either those of Germany or Poland. Those of Germany are the principalities of the Upper and Lower Rhine; that is, of Bavaria, and the Rhine. The palatinates in Poland are the provinces and districts of the Polish grandees or senators, who are the governors thereof.

PALATINATE OF THE RHINE, or LOWER PALATINATE, a country of Germany, in the circle of the Lower Rhine; bounded on the north by the electorate of Mentz and Catzenelnbogen; on the east by Catzenelnbogen, the electorate of Mentz, the bishopric of Worms, and a part of Franconia; on the south, by the duchy of Wurtemberg and the bishopric of Spire; and on the west by France, the duchies of Deux Ponts and Simmern, and the county of Sponheim. The greatest extent about eighty miles. This country indeed is partly mountainous, but yet uncommonly fertile, producing in abundance all manner of corn, pulse, fruit, chesnuts, and walnuts; and having also fine pasturage, and a good breed of cattle; together with plantations of tobacco, particularly between Heidelberg and Mannheim, as also good Neckar and Rhenish wine: the latter of these wines grows chiefly about Bacharach, and likewise on the Bergstrass. This Bergstrass is an agreeable highway, situated between Heidelberg and Darmstadt, which is planted with walnut-trees, and on both sides has fruitful fields and meadows, intermixed with hills and mountains, which on the right side of the road (namely, in travelling from Heidelberg to

Darmstadt), run to a considerable length, and are covered on the summits with woods, but towards the plain with vines. On all parts of the Bergstrass also grow almonds in great plenty, and in the vineyards up and down are chesnut-trees. The Rhine runs partly through the borders of this electorate-palatine, partly through its centre. In it also, near Germerheim and Seltz, out of the sands is washed the best gold; and to this gold the Rhenish gold florins owe their origin. The electorate-palatine contains in it forty-one towns and several boroughs. The ecclesiastical state has been subjected to a variety of alterations; the doctrines of Calvin and Luther having prevailed by turns, after the reformation had been at first introduced in the year 1518. The name and origin of the palatines, or phalzgraves, is deduced from the *palatia*, or palaces, (in the language of this country called *palzen*, *phalzen*, or *psalzen*) which the old Frankish and German kings and Roman emperors were possessed of in various places, and over which they appointed supreme stewards and judges, who were styled *psallenzgraves* or *psalzgraves*. The addition of *by* or *on the Rhine* first occurs in the year 1093. The electoral palatinate, ever since the resignation of the Upper Palatinate to the elector of Bavaria, paid only the half of the electoral evaluation. All that part of the palatinate which lay on the left side of the Rhine was by the peace of Luneville ceded to France, and formed the department of Mont Tonnerre. That department was, however, entirely taken from France at the peace of 1815; part of it was given to the grand-duke of Hesse, and the rest of it (we believe) to the emperor of Austria.

PALATINATE (Upper, or Bavarian), a part of Bavaria, bounded on the west and north-west by Franconia, on the east and north-east by Bohemia, and on the south by the duchy of Neuburg and Lower Bavaria. This country, in the twelfth century, belonged to the dukes of Swabia. They afterwards were annexed to the palatinate of the Rhine. In the year 1354, a great part was sold to Bohemia; and, after often changing its lords, at last, by the peace of Baden, in the year 1714, it was ceded to the elector of Bavaria; and was confirmed to him, with the title of king, by the treaty of Vienna, June 1815. Amberg is the capital of the Bavarian palatinate.

PALATINE, *adj.* Possessing royal privileges.—Many of those lords, to whom our kings had granted those petty kingdoms, did exercise *jura regalia*, inasmuch as there were no less than eight counties-palatine in Ireland at one time. *Davies on Ireland*.

PALATINE, or COUNT PALATINE, a title anciently given to all persons who had any office or employment in the prince's palace. The appellation is derived hence, that, anciently, the emperors sent the judges of their palace, whom they called *comites palatini*, or *pals-graves*, to correct the abuses of the other judges in the provinces of Saxony, Bavaria, Franconia, and the Rhine. Matthæus says, that the palatines were originally those who had the superintendence of the palace; the same with what the Greeks called *curopalata*, and the French *maîtres du palais*; though, in time, the name became more general.

PALATINE was afterwards a title conferred on those delegated by princes to hold courts of justice in the provinces; and on such among the lords as had a palace, that is, a court of justice, in their own houses. The French writers make the palatines of Champagne to be the first who bore that title; which, they will have it, the Germans and other people borrowed from them, not they from the Germans.

PAL'ATINE, *adj.* [from *palate*.] An epithet applied to many parts about the roof of the mouth: as the *palatine* artery, a branch of the internal maxillary; the *palatine* glands; the *palatine* ducts, which were supposed communications between the nose and mouth through the anterior palatine holes, or *foramina incisiva*; the *palatine* nerves, branches of the superior maxillary; the *palatine* processes of the superior maxillary and palate-bones. See ANATOMY.

PAL'ATINE,

PAL'ATINE, a post-town of the state of New-York, on the Mohawk river: 150 miles north of New-York.

PAL'ATINE BRID'GE, a bridge of ancient Rome, now called *St. Mary's Bridge*, which crosses over from the present church of St. Mary the Egyptian, at the lower end of the Forum Boarium to the Via Trans-tiberina. This bridge is supposed to be that which Livy speaks of (Decad. 4. l. 10.), built by M. Fulvius, washed down by the Tiber, and afterwards rebuilt by the censors Scipio Africanus and L. Mummius. Another inundation having damaged it, pope Gregory XIII. repaired it, partly upon the old piles, in the year 1575. But, another inundation sweeping away some of it in 1598, it has never since been repaired so as to be serviceable.

PALATINE COUNTRY. See COUNTRY, vol. iv.

PAL'ATINE GA'MES, among the Romans, were games instituted in honour of Julius Cæsar as some will have it, or, as others say, of Augustus, and celebrated in his palace during eight days, from the sixth calends of January. Suetonius informs us, that Caligula attended these games when he was assassinated.

PALATINE MOUNT, one of the seven principal hills inclosed within the walls of ancient Rome. Whether the Palatine-hill received its name from a people called *Palantes*, or *Palatini*, or from the beating or strolling of cattle, in Latin *balare* and *palare*; or from *Pales*, the pastoral goddess; or from the burying-place of *Pallas*; is disputed among the learned, and undetermined. (See PALACE.) Here, however, Romulus laid the foundation of his city, in a quadrangular form; and here the same king and Tullus Hostilius kept their courts; as did afterwards Augustus and all the succeeding emperors; on which account the word *palatium* came to signify a royal seat. To the east of this hill is Mons Cælius, to the south Mons Aventinus, to the west Mons Capitolinus, and to the north the forum. Its compass is 1200 paces. Romulus's house, preserved for several ages by the care of the senate, was on this hill, near the spot where the church of St. Anastasia now stands; as was also that of his foster-father Faustulus, near the place now occupied by the church of Sancta Maria Liberatrice.

PALATINE TRIBE, was one of the four tribes into which Rome was anciently divided. Servius Tullus added a fourth tribe to the three tribes into which Rome was divided by Romulus; and, having inclosed the seven hills within the city, and divided it into four quarters, which he named from the principal hills they contained, he assigned to each tribe its appropriate district. Thus, the inhabitants of the Capitoline Mount, the Palatine Mount, and the space between these two hills, composed the first tribe, called *Tribus Palatina*. They who dwelt in the quarter called Suburra, containing Mount Cælius, formed the second tribe, which retained the name of *Tribus Suburrana*. The inhabitants of the Esquiline Mount were called *Tribus Esquilina*. And they who lived on the Mounts Viminalis and Quirinalis, bore the name of the hills on which they were placed, and were called *Tribus Collina*, or *Collatina*.

PAL'ATIVE, *adj.* [from *palate*.] Pleasing to the taste. —Glut not thyself with *palative* delights. *Brown's Chr. Mor.*

PALA'TIUM, in ancient geography, a place in the territory of Reate, distant from it twenty-five stadia. Dionysius Halicarnæsis reckons it one of the first towns of the Aborigines; and from it Varro accounts for the name of the *Mons Palatinus*; namely, that a colony from Palatium settled there.

PALA'TIUM (Pliny), PALLANTIUM (Pausanias), PALANTEUM (Livy), or PALLANTEUM (Solinus). This last is the true writing; the great-grandfather of Evander, from whom it took its name, being called *Pallas*, not *Palas*. A town of Arcadia, which concurred to form Megalopolis. From it the *Palatium*, or *Mons Palatinus*, takes also its name, according to Virgil and Pliny.

PALA'TIUM DIOCLESIA'NI, the VILLA of DIOCLE-

SIAN, near Salonæ, where he died. Afterwards called *Spalatum*, which rose to a considerable city from the ruins of Salonæ; situated in Dalmatia, on the Adriatic. Now *Spalatro*.

PALA'TIUM LUCUL'LI, or VILLA LUCUL'LI; a place between Misenum and Baiæ in Campania, of wonderful structure. Now in ruins, and called *Piscina Mirabile*.

PALATULUN'GA, a town of Hindoostan, in Coim-betore: fifteen miles south-west of Errood.

PALAT'Z. See MILETS.

PALAVA'I, a town of the island of Ceylon: forty-eight miles west-north-west of Candy.

PALAVAS'ENY, a town of Hindoostan, in the circar of Joodpour: fifteen miles east of Joodpour.

PALA'VER, *f.* [supposed to be from the Spanish *palabra*, a word; whence, in Shakespeare, *palabras* is twice used in a cant sense, the context implying, Let us have no more talk, no more words. Hence also to *palabrize*, to flatter, to talk one over with fine stories, crept into the language, as in Cockeram's old vocabulary; which has been succeeded by the modern verb *palaver*, in the same sense: but it is used only by the vulgar.] Superfluous talk; deceitful conversation. *Todd.*—*Palaver* is derived from the ordinary Celtic word *parabl*, loquela. *Whiter Etym. Magn.*—Upon this quotation, furnished by Mr. Todd, our "Etymological Gleaner" very justly remarks, It is well known that *parabl* is not a Celtic word, but a Greek one, *παράβολον*; from which we have also made *parable*, an intricate speech, a circumlocution, an enigma, or simile.

PALAVÉ is also an African term, denoting a court of justice, or a public meeting of any kind. *New Cyclopædia.*

PALA'VIA, *f.* [so named in honour of Don Antonio Palau y Verdera, professor of botany in the royal garden at Madrid, who translated the *Philosophia Botanica* of Linnaeus into Spanish, and who, according to Cavanilles, has given much attention to the genera and species of plants. This gentleman is the author of several botanical or economical treatises in his native tongue.] In botany, a genus of the class monadelphia, order polyandria, natural order of columiferæ, (malvaceæ, *Juss.*) Generic characters—Calyx: perianthium one-leaved, half-five-cleft, permanent. Corolla: petals five, roundish, inserted into the base of the tube of stamens. Stamina: filaments very many, united below into a tube, in the top of the tube free; antheræ roundish. Pistillum: germ globular; style many-cleft at top, short; stigmas capitate. Perianthium: capsule roundish, many-celled: cells not opening, placed in a ball on the elevated central receptacle. Seeds solitary, roundish, angular.—*Essential Character.* Calyx half-five-cleft; style many-cleft; capsule many-celled: cells in a ball on the raised central receptacle. There are two species.

1. *Palavia malvifolia*: with smooth cordate leaves, either obtusely and deeply crenated, or lobed. This is an annual, with red, declinate, very-branched, stems, scarcely a palm long; leaves subobovate, smooth, alternate, with footstalks almost their own length: stipules small, blackish, lanceolate, and hispid. Flowers on long single peduncles, which are red, and shorter than the leaves: corolla rose-coloured. It is a native of sandy places at Lima in Peru, where it was first observed by Dombey: it flowers in that region in July, August, and September.

2. *Palavia moschata*: with tomentose, cordate, and ovate-crenated, leaves. This, which is the *Sida moschata* of Dombey, is also an annual; growing in sandy places in the neighbourhood of Lima, where it was also first observed by Dombey. The whole plant is downy, and has a musky smell. The stem is upright, branched, and two feet high: leaves somewhat wrinkled, cordate-ovate, sublobate, or obtusely and widely crenated; they stand alternate. Flowers solitary, axillary, and peduncled: peduncles jointed, and longer than the leaves; they are large, and of a yellowish purple.

PALAWAN'.

PALAWAN'. See PARAGUAY.

PALAZOL', a small island in the Adriatic. Lat. 44. 46. N. lon. 14. 47. E.

PALAZZO, a town of France, in the department of the Dora: five miles east of Ivrea.

PALAZZUO'LO, a town of Italy, in Friuli: fourteen miles south-west of Palma la Nuova.

PALAZZUO'LO, a town of Italy: fifteen miles west of Brescia.

PALAZZUO'LO, a town of the island of Sicily, in the valley of Noto: twenty miles west of Syracuse. Lat. 36. 55. N. lon. 15. 0. E.

PALCA'TI NOR', a lake of Tartary, in the country of the Eluths, called also *Tchoi*: thirty miles west of Harcas.

PAL'CIPAS, a town of South-America, in the province of Tucuman: fifty miles west-north-west of St. Fernando.

PALCOO'R, a town of Hindoostan: thirty miles south of Tinevelly.

PALCO'TE, a town of Bengal: sixteen miles south-west of Doofa. Lat. 22. 48. N. lon. 84. 53. E.

PALDA'MO, a town of Sweden, in the province of Cajana: five miles north of Cajanaborg.

PALDIA'NO, a town of the popedom, in the Campagna di Roma: five miles east-south-east of Palestrina.

PALE, *adj.* [Fr. from *pallidus*, Lat.] Not ruddy; not fresh of colour; wan; white of look.—Look I so *pale*, lord Dorset, as the rest? *Shakespeare*.

Was the hope drunk

Wherein you drest yourself? Hath it slept since?
And wakes it now to look so green and *pale*? *Shakespeare*.
Not high-coloured; approaching to colourless transparency.—When the urine turns *pale*, the patient is in danger. *Arbutnot*.—Not bright; not shining; faint of lustre; dim:

The night, methinks, is but the day-light sick;
It looks a little *paler*. *Shakespeare's Merch. of Ven.*

PALE, *f.* Palenefs:

His cheek, where love with beauty glow'd,
A deadly *pale* o'ercast. *Mallet's Edwin and Emma*.

To PALE, *v. a.* To make pale.—The sterre, dymmed,
paleth her white cheres by the flambes of the sunne that
overcommeth the sterre-light. *Chaucer's Boeth.*

The glow-worm shews the matin to be near,
And gins to *pale* his uneffectual fire. *Shakespeare*.

To teach it good and ill, disgrace or fame;
Pale it with rage, or redder it with shame. *Prior*.

PALE, *f.* [pal, Sax. *palus*, Lat.] A narrow piece of
wood joined above and below to a rail, to inclose grounds.
—Deer creep through when a *pale* tumbles down. *Mortimer*.

As their example still prevails,
She tempts the stream, or leaps the *pales*. *Prior*.

Any inclosure.—Thin enemyes schulen envyyrowne thee
with a *pale*. *Wicliffe's Luke* xix. 43.—Having been born
within the *pale* of the church, and so brought up in the
Christian religion, by which we have been partakers of
those precious advantages of the word and sacraments.
Whole Duty of Man.—He hath proposed a standing revelation,
so well confirmed by miracles, that it should be
needless to recur to them for the conviction of any man
born within the *pale* of Christianity. *Atterbury*.

Confine the thoughts to exercise the breath;
And keep them in the *pale* of words till death. *Pope*.

A district or territory.—There is no part but the bare
English *pale*, in which the Irish have not the greatest footing.
Spenser.—The lords justices put arms into the hands
of divers noblemen of that religion, within the *pale*.
Clarendon.—A perpendicular stripe; an heraldic term.—

VOL. XVIII. No. 1241.

The *pale* is the third and middle part of the scutcheon,
being derived from the chief to the base, or nether part
of the scutcheon, with two lines. *Peascham*.

But what art thou, that saiest this tale,
That werist on thy hose a *pale*. *Chaucer*.

An instrument of death.—The *pale* was an instrument of
punishment and execution among the ancient Romans,
and still continues so among the Turks. Hence "em-
paling," the passing a sharp *pale* up the fundament
through the body. *Chambers*.

To PALE, *v. a.* To enclose with pales.—The diameter
of the hill of twenty foot, may be *paled*-in with twenty
deals of a foot broad. *Mortimer*.—To inclose; to encom-
pass:

Whate'er the ocean *pales*, or sky inclips,
Is thine. *Shakespeare's Ant. and Cleop.*

To PALE, or IMPALE, *v. a.* To stand in rows, like
pales.—In the first aisle stood seventy poor women, *paling*
the passage on either side.—Both sides of the passage, near
a quarter of a mile long, was *impaled* by many thousands
of people. *Smythe's MS. Hist. of the Berkeley Family*.
Gent. Mag. Jan. 1819.

PALE-EYED, *adj.* Having eyes dimmed.—Shrines,
where their vigils *pale-ey'd* virgins keep. *Pope*.

No nightly trance, or breathed spell,
Inspires the *pale-ey'd* priest from the prophetic cell. *Milton*.

PALE-FACED, *adj.* Having the face wan:

Let *pale-fac'd* fear keep with the mean-born man,
And find no harbour in a royal heart. *Shakespeare*.

PALE-HEARTED, *adj.* Having the heart dispirited:

That I may tell *pale-hearted* fear, it lies,
And sleep in spite of thunder. *Shakespeare*.

PALEA'CEOUS, *adj.* [from the Lat. *palea*, chaff.]
Chaffy, producing chaff, resembling chaff.

PALEA'RIOUS (Aonius), an elegant and liberal scholar,
and martyr to the cause of the reformation, was born
about the beginning of the sixteenth century at Veruli
in the Campagna of Rome. The name of his family was
Della Paglia, and his baptismal name was *Antonio*, both
which he changed to the classical form under which he is
known, according to the practice of that learned age.
After having studied six years at Rome, he quitted it on
the approach of the imperial army in 1527, and took up
his abode at Perugia, Sienna, Padua, and other places,
improving himself by attendance on the most celebrated
professors. He fixed at length at Sienna, where he mar-
ried in 1536, and opened a private school for some young
men of rank. Here he passed some years tranquilly in
the bosom of his family, till his merit, and the freedom
of his opinions, began to raise him enemies. The sus-
picion into which he fell, as being a favourer of the re-
formation, gave them a handle for the dreadful accusation
of heresy; and in 1542 he was brought on that account
before the governor and archbishop. Upon this occasion
he wrote an oration, published among his works, in which,
though he did not avow the opinions imputed to him, he
spoke of them in a way that showed what he thought on
those points. He was however absolved; but was after-
wards thwarted in his attempts to obtain a chair in the
university. In 1544 he published anonymously a work in
Italian "On the Merits of Christ," which was written in
the principles of the reformers. He received an invita-
tion in 1546 to take the professorship of eloquence at
Lucca, with which he complied, and exercised that office
for several years. Such was his reputation for elegant li-
terature, that it procured him several distinguished friends,
among whom was cardinal Sadoletto, and caused him to
be invited to Milan in 1555, to succeed Majoragio in the
chair of eloquence. In that city he resided quietly till
the accession of pope Pius V. who, having been a domini-
can and an inquisitor, began his reign with the severe
prosecution

prosecution of heresy. Palearius was arrested and brought to Rome, where he was committed to a close imprisonment, and accused of various errors of doctrine. These were, that he denied purgatory, disapproved the custom of burying the dead in churches, spoke unfavourably of the monastic state and the lives of the monks, and attributed justification to the merits of Christ alone. Upon these charges he was convicted and condemned to the flames. After having (it is said) retracted his errors, he was strangled, and his body was burnt, in the month of July 1570. This was the lamentable fate of a man whom all agree to have been pious, moral, and learned. Of the writings of Palearius, the best known is his poem "De Immortalitate Animorum," in three books, first printed at Lyons in 1536, with a highly commendatory letter from cardinal Sadoleto. Its versification is formed upon that of Luccretius rather than that of Virgil, and is said to be faulty. The poem, however, has been reprinted in several collections of select Latin poetry by Italians. His other works are, Fourteen Orations on different subjects; Letters, and Poems, all written in a pure Latin style. After his death was printed his "Actio in Pontifices Romanos et eorum Affectus," which he had composed a short time before the meeting of the council of Trent, with an intention of getting it presented by the ambassadors of the emperor; but this was never done. It is an eloquent plea in favour of protestantism. *Bayle. Morevi.*

PA'LEATED, *adj.* Mingled with chaff; chaffy.

PALECKE, a town of Prussia, in the province of Oberland: fourteen miles south-east of Mohrungen.

PA'LED, *adj.* Striped; an heraldic term:

Buskins he wore of costliest cordwayne,
Pinckt upon gold, and *paled* part by part,
As then the guize was for each gentle swayne. *Spenser.*

Set round with pales, or something similar.—*Paled flowers* are those which have thin leaves set about, or surrounding, a head, or thrum; as in marigolds, &c. *Chambers.*

PALE'E, a town of Hindoostan, in Oude: forty-five miles west of Kairabad.

PALE'GA PAIANEL'LI, in botany. See BIGNONIA.

PA'LELY, *adv.* Wanly; not freshly; not ruddily.

PALEN'CIA, a town of Spain, in the province of Leon, on the Carrion, the see of a bishop, suffragan of Burgos. It contains five churches, eleven convents, and two hospitals. It was anciently one of the strongest towns belonging to the Vaccæi, and named *Pallantia*. It is fifty-seven miles south-east of Leon, and one hundred north-north-west of Madrid. Lat. 41. 59. N. lon. 4. 34. W.

PALE'NDAR, or PADANDER, *f.* A kind of flat-bottomed boat used for the transportation of horses; it was furnished with a platform to be let down as a drawbridge for landing, but which at sea was closed into the side of the vessel.—Solyman sent over light horsemen in great *palendars*, which, running all along the sea-coast, carried the people and the cattle. *Knolles.*—From the version of Vigniere, I adopt the well-sounding word *palander*, which is still used, I believe, in the Mediterranean. *Gibbon*, ch. lx.

PA'LENESS, *f.* Wanness; want of colour; want of freshness; sickly whiteness of look.—Her blood durst not yet come to her face, to take away the name of *paleness* from her most pure whiteness. *Sidney.*

The blood the virgin's cheek forsook,
A livid *paleness* spreads o'er all her look.

Pope.

Want of colour; want of lustre:

The *paleness* of this flow'r
Bewray'd the faintness of my master's heart. *Shakespeare.*

PALE'NO, a town of Naples, in Abruzzo Citra: fifteen miles south-west of Langiano, and nine east of Sulmona. Lat. 43. 3. N. lon. 14. 2. E.

PALEN'QUE, a town of Mexico, in the province of Chiapa: sixty miles north-east of Chiapa dos Espanoles.

PALEN'QUE, a small island in the Spanish Main. Lat. 9. 30. N. lon. 79. 5. W.

PAL'ENSEN, a town of Westphalia, in the principality of Calenberg: six miles south of Hanover.

PALENZUELA, a town of Spain, in Old Castile: twenty-five miles south-west of Burgos.

PALEOCAS'TRO. See POLICASTRO.

PALEOCAS'TRO, a town on the north coast of the island of Lemno. Lat. 40. 0. N. lon. 42. 55. E.

PALEOGRAP'HY, *f.* [*paleographie*, Fr. *παλαιος* and *γραφω*, Gr.] The art of explaining ancient writings. *Todd's Johnson.*—We have never met with this word before. Mr. Todd quotes no authority for it; but the French word from which he derives it is of recent use, having been coined since the revolution.

PALEOT'TI (Gabriel), a learned Italian cardinal, was born at Bologna in the year 1524. He was descended from a family which had produced several eminent characters in the profession of civil and canon law; and, being himself led by inclination to the same pursuit, he made a rapid and very successful proficiency in the study of literature and jurisprudence, at the university in his native city. The first preferment which he received, was a canonry of Bologna; after which he was appointed professor of civil and canon law at the university. The Farnese family obtained for him the post of auditor of the rota at Rome, when he was only thirty-three years of age. When pope Pius IV. opened the council of Trent, he sent Paleotti thither in the capacity of proctor and counsellor to his legates, who took no step of importance without his advice. Of this council Paleotti wrote a "History," still remaining in MS. of which Pallavicini freely availed himself, in his work on the same subject. After the breaking-up of this council, he returned to his office at Rome, which he held till 1565, when Pius IV. raised him to the dignity of the purple. By Pius V. he was created bishop of Bologna, and that see was erected into an archbishopric by the same pope, to do honour both to Paleotti and his native country. On his conduct in this dignity the highest commendations are bestowed by his biographers, who observe, that a kind of rivalry seemed to exist between him and the great cardinal Borromeo archbishop of Milan, who should most diligently discharge the duties of a good pastor. Paleotti died at Rome in 1597, when about seventy-three years of age. He was the author of several works of considerable merit, on subjects in antiquities, jurisprudence, and morals. The most considerable of them are, 2. *Archiepiscopale Bonnoniense*, 1594, folio. 3. *De Imaginibus Sacris et Profanis*. 4. *De Sacri Consistorii Consultationibus*. 5. *De Nothis, Spuriisque Filiis*, 8vo. 6. *De Bono Senectutis*, 8vo. 7. *Pastoral Letters, Instructions, &c.* *Landi's Hist. Lit. de l'Italie*, vol. iv.

PA'LEOUS, *adj.* [*palea*, Lat.] Husky; chaffy.—This attraction we tried in straws and *paleous* bodies. *Brown.*

PALEPAR'TO, a town of Naples, in Calabria Citra: ten miles south of Rosano.

PALE'POLI, a seaport-town of Asiatic Turkey, in Caramania, on the south-coast: 120 miles south of Cogni.

PALER'MO, a city of Sicily, in the Val-di-Mazara, with an archbishop's see and a large harbour. This city, which is the capital of Sicily, is of great antiquity; and, if a conjecture may be formed from its ancient name *Panormus*, which signifies "an universal harbour," it was formerly in a very flourishing condition. By whom it was founded is uncertain; nor have we any authentic accounts of its inhabitants till it became a colony of the Phœnicians, after which it passed into the hands of the various nations that became masters of this island. At different epochs it has held the rank of a metropolis. As it was the capital of the Saracens, we may readily account for many interesting and valuable monuments of that nation still existing. The palaces Zisa, Cuba, and Mare Dolce, were the habitations of the Saracen princes. The Zisa, together with a small mosque adjoining, on the battlements of which some Saracenic inscriptions appear, is in a perfect

perfect state of preservation. An ambassador from Morocco, who was there some time ago, was much struck with it, and said the plan of the building was similar to those of such edifices in his own country. A large apartment, in the third story, he pronounced to be the council-chamber. The summit of this edifice commands a striking view of the beautiful and fertile plain and garden of Palermo, surrounded by lofty and majestic mountains, broken into the most picturesque forms, together with the port, sea, &c. and the adjacent islands.

This city, according to Brydone's account, is greatly superior to Naples in beauty and elegance. Although it is not so large, yet the regularity, the uniformity, and the neatness, of its streets and buildings, render it much more pleasing; it is full of people, who have mostly an air of affluence and gaiety. It stands near the extremity of a kind of natural amphitheatre, formed by very high and rocky mountains; and the country that lies between the city and these mountains is one of the richest and most beautiful spots in the world. The whole appears a magnificent garden, filled with fruit-trees of every species, and watered by clear fountains and rivulets, that form a variety of windings through this delightful plain. From the singularity of this situation, as well as from the richness of the soil, Palermo has had many flattering epithets bestowed upon it, particularly by the poets; who have denominated it *Conca d'Oro*, the Golden Shell, expressing both its situation and richness. It has likewise been styled *Aurca Balli*, *Hortus Siciliæ*, &c. and, to include all these together, the lasting term *Felix* has been added to its name, by which it is even distinguished in the maps.

Palermo is built upon a very regular plan: its two great streets intersect each other in the centre of the city, where they form a beautiful and regular square called the Ottangolo, adorned with very handsome and uniform buildings. The centre of this square commands the whole of these noble streets and the four great gates of the city which terminate them, and which are at the distance of about half a mile; the diameter of the city being no more than a mile. These are elegant pieces of architecture richly adorned; particularly the Porta Nova and Porta Felice, that terminate the street called the Corso, which runs south-west and north-east. The smaller streets, in general, run parallel to these great ones. The Porta Felice (which is by much the handsomest of the gates) opens to the Marino, a delightful and much-frequented walk, bounded on one side by the wall of the city, and on the other by the sea, from which there is, in the hottest weather, an agreeable breeze. In the centre of the Marino there is an elegant kind of temple, which serves as an orchestra for music in the summer-months. It should have been mentioned, that the mode of building in this country differs greatly from ours. The ground-floor, even of magnificent palaces, frequently consists of shops: in each building there is a common stair-case, and each stage of apartments forms, as it were, a separate residence, being generally inhabited by different families; and this is always the case, except in the residences of some of the principal nobility.

Of the backward state of literature in Palermo we may form some idea, from the circumstance of there being only two regular bookellers in a city which is twice as large as Edinburgh. Till of late years, the Sicilian has been accounted a mere dialect of the Italian, and printed compositions have almost always appeared in the latter; but attempts are now making to raise the former from this comparative degradation, and to change it from a provincial to a national tongue. A Sicilian dictionary of large size has been printed, and several poets have set the example of publishing in their native language.

This city contains, besides an university, many churches, abbeys, seminaries, convents, and hospitals. Many of the churches are extremely rich and magnificent. The cathedral (Madre Chiesa) is a very venerable Gothic building, of a large size, supported within by eighty columns

of oriental granite, and divided into many chapels, some of which are extremely rich, particularly that of St. Rosalia, the patroness of Palermo, who is held here in greater veneration than even the Virgin Mary herself. Her relics are preserved in a large silver box, curiously wrought, and enriched with precious stones. These perform many miracles, and are looked upon as the greatest treasure of the city. The Jesuits' church is singularly magnificent; and the Chiesa del Pallazzo is entirely covered over with ancient mosaic. The church of Monreale, about five miles distant from this city, is the next in dignity in the island, after the cathedral of Palermo.

The population of this city is much greater, in proportion to its size, than that of Naples; and the number of carriages is astonishing. One of the grandest exhibitions is that of the feast of St. Rosalia. Palermo had anciently two ports, mentioned by Polybius and Diodorus; which were destroyed by an earthquake in 1327. At present it has two; one for barks, and another for vessels of war, with a light-house at its entrance. There is a magnificent castle built near the sea-side, wherein the viceroy resides six months in the year; and his presence draws a great number of nobility to this place. This city has suffered greatly by earthquakes, particularly in 1693; and it was greatly damaged by a fire in 1730, when a magazine of powder, containing 400 tons, was blown up. Palermo exports, in favourable years, about 40,000 bales of silk: it has moreover some manufactures of silks and stuffs. Its population is estimated at 200,000 persons.

It is very remarkable, that the dead in Palermo are never buried. Captain Sutherland gives the following account of this circumstance, in his Tour to Constantinople. The dead bodies are carried to the Capuchin convent, which is one of the largest in Italy; and there, after the funeral-service is performed, they are dried in a stove heated by a composition of lime, which makes the skin adhere to the bones. They are then placed erect in niches, and fastened to the wall by the back or neck. A piece of coarse drab is thrown over the shoulders and round the waist; and their hands are tied together, holding a piece of paper with their epitaph, which is simply their names, age, and when they died. We of course (says captain Sutherland) visited this famous repository; and it is natural to suppose that so many corpses would impress one with reverence and awe. It was nearly dusk when we arrived at the convent. We passed the chapel, where one of the order had just finished saying vespers by the gloomy glimmering of a dying lamp. We were then conducted through a garden, where the yew, the cypress, and the barren orange, obscured the remaining light; and where melancholy silence is only disturbed by the hollow murmuring of a feeble water-fall. All these circumstances tuned our minds for the dismal scene which we were going to behold; but we had still to descend a flight of steps impervious to the sun; and these, at last, conveyed us to the dreary mansion of the dead. But, (will you believe me?) notwithstanding the chilling scene through which we had passed, notwithstanding our being in the midst of more than a thousand lifeless bodies, neither our respect for the dead, nor for the holy fathers who conducted us, could prevent our smiling. The physiognomies of the deceased are so ridiculously mutilated, and their muscles so contracted and distorted in the drying, that no French mimic could equal their grimaces. Most of the corpses have lost the lower part of the nose; their necks are generally a little twisted; their mouths drawn awry in one direction, their noses in another; their eyes sunk and pointed different ways; one ear perhaps turned up, the other drawn down. The relations of the deceased are bound to send two wax-tapers every year for the use of the convent; in default of which, the corpse is taken down, and thrown into the charnel-house. Were it not for the number of vacancies occasioned by the non-payment of this stipend, the capuchins would be unable to find niches for the number of men who must die every year

year in so populous a city as this. Women are dried as well as the men, but are not exposed. The bodies of princes, and of the prime nobility, are enclosed in handsome chests, the keys of which are kept by the nearest relations of the family. This city lies 111 miles west of Messina, in lat. 38.10. N. lon. 13.25. E. See, for farther particulars of this beautiful city, Hill's Travels through Sicily and Calabria. Brydone's Tour through Sicily and Malta. Sutherland's Tour to Constantinople. Galt's Voyages and Travels, 1809, 10, 11. Sicily and its Inhabitants, by W. H. Thompson, 1813. Cockburn's Voyage to Cadiz and Gibraltar, 1815. Sir R. C. Hoare's Classical Tour through Italy and Sicily, 1819.

A revolution, which led to the quiet re-establishment of the Cortes and the constitution of the year 1812, had taken place in Spain, on the 6th of March, 1820. A similar and bloodless revolution, adopting the constitution of Spain, followed at Naples on the 6th of July. On the 14th, the vessel sent from Naples to announce the news that his majesty had sworn to the constitution, arrived at Palermo; and the first impulse of the people was to adopt the tri-coloured badge of the constitution. Accordingly, on the evening of that day, in the promenade near the cathedral, which was brilliantly illuminated in honour of the festival of St. Rosalia, the people spontaneously mounted the cockade of Naples, black, sky-blue, and red. But this harmony lasted only a single day; for, on the 16th, the yellow or Sicilian ribband was displayed in conjunction with the other colours; and the people began to express their desire to adopt the constitution of Spain, on condition that the kingdom of Sicily should be separated from that of Naples, and governed by a king which it should choose for itself out of the royal family. This first burst of independence might perhaps have passed over harmlessly, but that an accident, or an indiscretion, exasperated the people against the Neapolitan authorities and troops. General Church, an English officer in the pay of Naples, is said to have torn the badge of Sicilian independence from the breast of an unarmed citizen. Enraged at this act, the forts in the possession of the Neapolitan soldiery were attacked and carried by the islanders. On the morning of the 17th, 700 prisoners were released from confinement by the populace; and then the Neapolitans were furiously attacked, and indiscriminately butchered. The accounts estimate the loss of life at 2000 killed, and about 3000 wounded.

The next step, of course, was to form a Supreme Junta, or provisional government. This was effected on the 19th: it consisted of 10 Sicilian nobles, 10 opulent citizens, and 72 heads (consuls) of trades. A deputation of eight persons from this body sailed on the 26th from Palermo for Naples, to negotiate the independence of the Sicilians, and stating their determination not to remain a province of the kingdom of Naples. They returned on the 6th of August, having met with a refusal; in fact, we believe they were not permitted to land.

The return of the deputies from Naples was the signal of the most prompt and vigorous measures on the part of the provisional government at Palermo. A decree was immediately issued, for enrolling in the military service of the country the name of every inhabitant of Sicily capable of bearing arms, without exception of rank; and troops were sent to attack those places which still adhered to their dependence on Naples. Those were Messina, Trapani, Catania, and Syracuse. At Caltanissetta also strenuous resistance was made; and a division of the Army of National Independence, under the command of the Prince of St. Cataldo, invested the place on the 8th of August. After defeating a most treacherous attempt to surprise his army, the prince took the town by storm.

It appears that the Junta of Palermo have under their orders an armed, though undisciplined, force of 60,000 men, headed by the chief of the Sicilian nobility, and actuated by a strong repugnance to bear any longer the sway of their continental neighbours. Messina, Augusta,

and Trapani, are the only places that hold out; and, in consequence, the Neapolitan government has declared Messina to be the capital of the island of Sicily, instead of Palermo.

We trust, for the sake of all parties, that the Sicilians and the Neapolitans will be equally convinced of the necessity of their uniting, in some way or other, against all foreign aggressors; for both nations (if we may call them two) are threatened with foreign interference; and we shall have occasion to state the result under the article SICILY.

PALERMO, a town of North America, in the state of Maine, and county of Lincoln; with 761 inhabitants.

PALERNO, a town of Naples, in Principato Ultra: twelve miles west-north-west of Conza.—Also, a town of Naples, in Calabria Citra: six miles south-west of Cosenza.

PALES, in mythology, the divinity of shepherds, or the tutelar deity and protectress of flocks. Her festival was called PALILIA, which see.

PALESCIA'NO, a town of Naples, in the province of Otranto: three miles south-east of Motola.

To PAL'ESATE, *v. a.* [from *palefement*, old Fr. openly.] To manifest.—The counsel of the Turks had not *palefated* itself openly. *Sir A. Sherley.*

PAL'ESTINE, or the HOLY LAND, a country of Asia, once the habitation of God's chosen people, but now under the domination of the Turks.

This once fertile and happy spot was first called the Land of *Canaan*, from Noah's grandson. In Scripture, however, it is frequently distinguished by other names; such as the *Land of Promise*, the *Land of God*, the *Land of Israel*, &c. It received the name of *Palestine* from the Palestinians, or Philistines, who possessed a great part of it; and it had the name of *Judea*, or *Judea Palestina*, from *Judah*, the most considerable of the twelve sons of Jacob. The Christians have denominated it the *Holy Land*; partly on account of the many singular blessings it received from the Divine Providence, and partly on account of its metropolis being made the centre of God's worship, and his peculiar habitation; but much more for its being the place of our Saviour's birth, the scene of his preaching and manifold miracles, and lastly the place in which he accomplished the great work of our redemption. As to the name of *Judea*, it did not begin to receive that till after the return of the Jews from the Babylonish captivity, though it had been styled long before the *Kingdom of Judah*, in opposition to that of *Israel*, which revolted from it under Jeroboam, in the reign of Rehoboam, the son of Solomon. But, after the return, the tribe of Judah, the only one that made any figure, settling at Jerusalem, and in the countries adjacent, quickly gave its name to the whole territory. By profane authors it was called by many different names; such as Syria, Palestina Syria, Cœlosyria, Iduma, Idumæa, and Phœnicia or Phœnice; but these are supposed only to have been given out of contempt to the Jewish nation, whom they looked upon as unworthy of any other name than what distinguished the most obscure parts of the neighbouring provinces. See the Map, vol. viii. p. 388.

That part of the country which was properly called the *Land of Promise*, was enclosed on the west by the Mediterranean, on the east by the Lake Asphaltites, the Jordan, the Sea of Tiberias or of Galilee, and the Samachonite Lake; to the north it had the mountains of Libanus, or rather of Antilibanus, and the province of Phœnicia; and to the south, that of Edom or Idumæa, from which it was likewise parted by another ridge of high mountains. The boundaries of the other part, which belonged to the two tribes and a half beyond the river Jordan, are not so easily defined, as well as those of the conquests made by the more prosperous kings of the Jews. All that can be said with any probability is, that the river Arnon was the first northern boundary on that side; and, with respect to those on this side the Jordan, there is a considerable disagreement between the Hebrew and Samaritan versions of the Pentateuch.

Pentateuch. The extent of this country is likewise variously settled by geographers; some giving it no more than 170 or 180 miles from north to south, and 140 in breadth where broadest, though not much above half that breadth where narrowest. But, from the latest and most accurate maps, it appears to extend near 200 miles in length, and about 80 in breadth near the middle; and about 10 or 15, more or less, where it widens or contracts.

The land was divided by its original inhabitants into so many *toparchies*, or petty states, each of which had its chief, or king; and, in this respect, it was something like the ancient state of Britain, during the time of the Saxon heptarchy. All these were conquered and destroyed, one after another, by the children of Israel, as related in the book of Joshua, and other parts of the sacred Scriptures. After the conquest by the children of Israel, Judea, in its largest sense, was divided into maritime and inland, and into mountainous and champaign; and, as the river Jordan ran across it, it was again divided into Judea on this side, and Judea beyond, Jordan. But the most considerable division is that which was made, according to the divine appointment, among the twelve tribes, by lot, to prevent all murmuring and discontent among that stubborn people; and of which, two tribes and a half were seated beyond (or on the east of) Jordan, and the rest on this side. The next remarkable division was made by king Solomon; who divided his kingdom into twelve provinces, or districts, under peculiar officers, each of which was to supply the king with provisions for his household in their turn, that is, each for one month of the year. But the most fatal division was made under his imprudent son Rehoboam, when ten of the twelve tribes revolted from him, under the influence of Jeroboam, who became head of this new monarchy, styled the kingdom of *Israel*, in opposition to that of *Judah*; the title by which the dismembered kingdom of Rehoboam was known from that time downwards. Under the second temple, this distinction lasted a considerable time, and the same hatred continued between these two kingdoms; that of Israel, from its capital city, being called Samaria; and the inhabitants of this kingdom were a mixture of the old Israelites, and those sent thither by the kings of Assyria, after their conquest of it, till they were subdued by the Maccabees, and their metropolis destroyed. Under the Romans it began to be divided again into petty states, called tetrarchies and toparchies; some greater than others: the largest were those of Judea, Samaria, and Galilee Upper and Lower; the smaller those of Geraritica, Saron, and some others of less note; all which were on this side the Jordan: those on the other side, were Gilead, Peræa, Gaulonitis, Auranitis, Batanea, and Decapolis. Josephus mentions another division, made in Gabinius's time, into five districts, or, as he styles them, *συνοδικα*, or councils, agreeable to the Roman manner; and these were, Jerusalem, Jericho, and Sephoris, on this side Jordan; and Gadara and Amathus, on the other; but these did not last long. In process of time, during the reigns of the Christian emperors, it was divided afresh into *Palæstina Prima*, *Palæstina Secunda*, and *Palæstina Tertia*, or *Salutaris*, which included the far greater part, if not the whole country.

The division that principally prevailed in the time of our Saviour, was that which subsisted under the Romans, to whom the land of Judea was then subject, and by whom it was divided into the provinces of Judea, Samaria, and Galilee. Judah is the most southern part, and Galilee the most northerly; on which account Samaria, called at present the country of Nablousa, remained in the middle, and was, as it were, the centre of all Palestine: thus, when St. John, mentioning the travels of our Saviour, says, *He left Judea, and departed into Galilee*, he immediately adds, *and he must needs go through Samaria*; (John iv. 3, 4.) which evidently shows the situation of the pro-

vinces. The Holy Land even yet is considered as divided into the same three parts. The capital of Judea is Jerusalem; that of Galilee, the small city of Nazareth; and that of Samaria, the city of Nablousa, the ancient Sichem, and not the city of Samaria or Sebastia, which at present is only a paltry village. "These provinces, in different respects, excelled, and consequently were inferior to, each other. With respect to antiquity, Galilee has the preference; Judea next; Samaria, in a provincial view, being of much later date. In extent, Judea takes the lead, being on both sides the Jordan; Galilee, Upper and Lower, is the second; and Samaria, the most inconsiderable of the three. As to honour, Judea again asserts her superiority, on account of Jerusalem, her capital; Samaria next asserts her claim, without contention; for Galilee, though the most ancient, seems to be conscious of her meanness. Yet out of Galilee, whence no good thing was expected, came Jesus Christ, and most, if not all, his apostles. In point of safety from foreign invasions, Samaria, the middle province, was most secure; Judea next; and Galilee least. But, in fruitfulness, Galilee exceeds; Samaria follows; and Judea, without controversy, gives up the claim to both." Martin's Conquest of Canaan.

Palestine, in its present state, is a part of Asiatic Turkey, situated between $31^{\circ} 30'$ and $33^{\circ} 20'$ north latitude, and between $34^{\circ} 50'$ and $37^{\circ} 15'$ east longitude. It is bounded by Mount Libanus, which divides it from Syria, on the north; by Mount Hermon, which separates it from Arabia Deserta, on the east; by the mountains of Seir and the deserts of Arabia Petræa, on the south; and by the Mediterranean Sea, on the west.

We need scarcely remind our readers, that the Holy Land is in the sacred writings represented to have been exceedingly fertile, rich, populous, and powerful. Its vast population is an evident proof of the fertility of its soil. In the time of king David, there were 1,100,000 combatants in the kingdom of Israel, and 470,000 in the tribe of Judah alone, without reckoning those of Benjamin or of Levi. Some writers conclude therefore that its inhabitants, comprehending women, children, old people, and those unfit for bearing arms, might amount in all to eight millions. The Land of Canaan contained a prodigious number of cities and villages, as may be seen in the 25th chapter of Joshua, where we are told that 112 walled cities fell to the lot of the tribe of Judah alone. Of all its ancient cities, however, a few only remain; the rest being either destroyed, or their names given to paltry villages, now almost in ruins. The population of this country is also greatly diminished; but at present no certain calculation can be given of it, as the number of inhabitants continually varies, on account of the Bedouin Arabs, who always come hither at certain periods from Arabia, and the country beyond the Jordan, in order to feed their flocks.

If this country has lost its ancient splendour by the destruction of its cities, and the decrease of its population, it still retains its natural advantages, being beautifully variegated with mountains, hills, and delightful plains. Its climate is exceedingly good, the situation being neither too far south nor too far north. But the limits of Palestine appear so small, considering that the country is likewise intersected by high ridges of mountains, woods, deserts, &c. that many learned men have been induced to question what we read of its fertility and populousness in former times. It must be owned, indeed, that when we compare its ancient and flourishing state, when it was cultivated with the utmost diligence by persons well skilled in every branch of agriculture, with what it has been since the total extirpation of the Jews out of it, and more especially since it fell into the hands of the Turks, the contrast is amazingly great; but, when we consider the many evident causes which have contributed to effect this change, and even yet consider the nature of the country itself, we find not the least reason to doubt the truth of what the sacred

historians

historians have related. Moses describes the richness of it in the strongest terms, even before the Israelites got possession of it. (Deut. viii.) It even exceeded the land of Egypt, so much celebrated by ancient historians; especially in the vast numbers of cattle which it produced, in the quantity and excellence of its wine, oil, and fruits. With respect to the oil and fruits, it is plain, that the olives and oil of Canaan exceeded in goodness those of Egypt, since the tribes sent them thither from thence; and as for vines, Herodotus tells us that the Egyptians had none at all, but supplied the want of them by a liquor brewed from barley. The presents which Jacob sent to his son Joseph, of honey, spices, myrrh, almonds, and other fruits of Palestine, shew that they must have been much better in the land of Judea than in Egypt. The wines of Gaza, Ascalon, and Sarepta, were famous among the most remote nations; though it is allowed, that the wine which was made at, and in the neighbourhood of, Bethlehem, in great quantities, was equal at least, if not superior, to any of the rest; and that of Libanus, mentioned by the prophet Hosea, was no less celebrated for its excellent flavour.

Several circumstances contributed to this wonderful fecundity: such as the excellent temperature of the air, which was never subject to excessive heats or colds; the regularity of its seasons, especially the former and latter rain; and the natural fatness and fertility of its soil, which required neither dunging nor manuring, and could be ploughed with a single yoke of oxen and a small kind of plough; for the soil was, and is still, so shallow, that to have gone deep into it would rather have endangered than improved the crop. With respect to the excellency of its corn, we are told, that the bread of Jerusalem was preferred above all other; and the tribe of Asher produced the best of both, and in greater quantity than any other tribe; and such plenty was there of it, that, besides what sufficed the inhabitants, who made it their chief sustenance, Solomon, we read, could afford to send 20,000 cors, or measures, of it, and as many of oil, yearly, to Hiram king of Tyre; besides what they exported into other countries. And we find, even so late as king Herod, surnamed Agrippa, the countries of Tyre and Sidon received most of their sustenance from his tetrarchy.

As to their fruits, the grapes were delicious, finely flavoured, and very large. The palm-tree, and its dates, were in no less request; and the plain of Jericho, among other places, was famed for the great plenty and excellence of that fruit; inasmuch, that the metropolis of that territory was emphatically styled *the city of palm-trees*. But, what both this plain and other parts of Palestine were most celebrated for, was the balsam-shrub, whose balm was esteemed so precious a drug among the Greeks, Romans, Egyptians, and other nations, and is still to this day under the name of *balm of Gilead*. They had likewise the greatest variety of other fruit-trees in the highest perfection; and which might be, in some sense, styled *perpetual*, because they were not only covered with a constant verdure, but because the new buds always appeared on the same boughs before the old fruit was ripe; and of those buds, which were in too great quantities to be allowed to come to maturity, they gathered enough to make very delightful pickles and sweetmeats, especially of their citrons, oranges, and apples of paradise, which last commonly hung by hundreds in a cluster, and as big as hens' eggs, and of an excellent taste and flavour. Their vines yield grapes twice, and sometimes three times, a-year, great quantities of which were dried and preserved for use, as well as their figs, plums, and other fruits. They had plenty of honey; the very trees distilled it; and the rocks yielded it in great quantities: but, whether that of the latter kind was there deposited by the industrious bees, or produced some other way, is much disputed by travellers and naturalists. They likewise cultivated sugar-canes in great abundance; and the

cotton, hemp, and flax, were mostly of their own growth and manufacture, except some of a finer sort, that were brought to them from Egypt, and worn by those of the higher rank. Their vicinity to Libanus made the cedars, cypresses, and other stately fragrant trees, very common in most parts of the land, but more especially in Jerusalem. Cattle, both large and small, they fed in vast quantities; and the hilly countries not only afforded them variety and plenty of pasture, but also of water, which descended thence into the valleys and low lands, and fertilized them to the degree we have seen; besides several other rivers and brooks, some of the most remarkable of which we shall speak of in their proper places.

As to the deserts and forests, which were sometimes called wildernesses, upon which some stress has been laid, some were indeed horrible, but others, when the Jews possessed the land, as delightful: for many of them were then inhabited, and surrounded by cities and villages, rich and well peopled; and, indeed, there were but few cities, which had not some *desert*, according to the scripture-idiom, belonging to it, for feeding their cattle; so that the word commonly meant no more than a land, or tract, that bore neither corn, wine, nor oil; but was left to its natural production; and generally abounded with thyme, marjoram, sage, and other aromatic herbs. But the most fertile pasture-grounds were those on each side of the river Jordan; besides those of Sharon, or Sarona, the plains of Lydda, Jamnia, and some others, then justly famed for their fecundity. As for fish, the river above-mentioned, the lake of Tiberias, and the Mediterranean Sea, afforded, as they do to this day, great plenty and variety. Vast quantities were brought to Jerusalem, on which the inhabitants mostly subsisted; and hence one of the gates of that metropolis was, according to St. Jerome, called the *fish-gate*. The Lake Asphaltites yielded salt in abundance, wherewith to season and preserve their fish, which Galen affirms to have been preferable to any other for wholesomeness, digestion, and extenuation. In short, the Scripture is so pregnant with proofs of the extraordinary richness and fecundity of this once-happy land, and the vast number of people that lived in it, almost wholly upon its product, to say nothing of the vast exports of its corn, wine, oil, raisins, and other fruits, &c. that a man must have taken a strange warp to infidelity, that can call it in question, merely on account of the melancholy figure it makes under its present tyrannical government.

We may further observe, after the judicious Mr. Maundrell, that there is no forming an idea of its ancient flourishing state, when under the influence of heaven, from what it is now, *under a visible curse*. And, if we had not several concurring testimonies from profane authors, who have extolled the fecundity of Palestine, that single one of Julian the Apostate, a sworn enemy to Jews and Christians, would be more than sufficient: he frequently makes mention, in his Epistles, of the perpetuity, as well as excellence and great abundance, of its fruits and products. The visible effects of God's anger, which this country has felt, not only under Titus Vespasian, (when myriads of inhabitants were either slain, or perished by the most severe famine, pestilence, and other calamities, and the rest sold for slaves into all lands;) but much more since that emperor's time, in the inundations of the northern barbarians, of the Saracens, and of the more cruel and destructive Christians during the crusades; and in the oppression it now feels under the Turkish yoke; may be easily owned to be more than sufficient to have wrought the dismal change we are speaking of, and to have reduced the far greater part into a mere desert.

Nevertheless, if we may credit those who have viewed it in this doleful condition, they will tell us, there are still such visible signs of its natural richness and fertility, as plainly shew, that the bare want of culture is the main, if not the only, cause of its present poverty and barrenness.

"The

"The Holy Land (says Dr. Shaw), were it as well peopled and cultivated as in former times, would still be more fruitful than the very best part of the coast of Syria and Phœnicie; for the soil is generally much richer, and, all things considered, yields a preferable crop. Thus the cotton that is gathered in the plains of Ramah, Esdraelon, and Zabulun, is in greater esteem than what is cultivated near Sidon and Tripoli. Neither is it possible for pulse, wheat, or any sort of grain, to be more excellent than what is sold at Jerusalem. The barrenness, or scarcity rather, which some authors may, either ignorantly or maliciously, complain of, doth not proceed from the incapacity or natural unfruitfulness of the country, but from the want of inhabitants, and the great aversion there is to labour and industry in those few who possess it. There are, besides, such perpetual discords and depredations among the petty princes who share this fine country, that, allowing it was better peopled, yet there would be small encouragement to sow, when it was uncertain who should gather in the harvest. Otherwise, the land is a good land, and still capable of affording its neighbours the like supplies of corn and oil which it is known to have done in the time of Solomon."

Nothing can afford, even in the present day, a more agreeable change than the fertile valley of Palestine, on quitting the parched sands of Arabia. The impression made on Ali Bey seems exactly the same as that which was experienced by the progenitors of the Jews, and in our own day by a very different description of combatants; we mean the French soldiers who marched in 1799 from Egypt under Bonaparte. To all these the land of Canaan appeared still to be *the land flowing with milk and honey*.

"All the country of Palestine which I saw from Khan-younes to Jaffa (says Ali Bey) is beautiful. It is composed of round undulated hills, of a rich soil, similar to the slime of the Nile, and is covered with the richest and finest vegetation; but there is not a single river in all the district, not even a spring; all the torrents I crossed were dry, and the inhabitants have no other water to drink than that which they collect in the rainy season, nor any other means of irrigation than rain-water, and that of the wells, which is very good. Such was the cause of the frequent famines which are recorded in history to have happened in this country. A territory in which there is no spring, and no river to bring to it the waters of other countries, and whose subsistence depends absolutely upon the local rains, is necessarily exposed to a scarcity, when this blessing from heaven fails, or is insufficient.

"It is worthy of remark, that all the inhabited places which I have seen in Arabia are situated in valleys or hollows; and, on the contrary, all the towns and villages in Palestine are built upon hills or heights. This difference may be attributed to the scarcity of the rains in Arabia, and their abundance in Palestine. Game abounds in Palestine; partridges are found in large coveys, so fat and heavy, that no other weapon than a stick is requisite to take them. But, at the same time, we meet with a number of lizards, different kinds of serpents, vipers, scorpions, and other venomous insects. The multitude of flies of every species in this country is such, that the camels, mules, and horses, become almost mad, and roll themselves upon the ground, and among the bushes, to get rid of them. But what shall I say of the ants? Let the reader imagine an immense ant-hill, extending over the earth for three days' journey, and he will have an idea of what I have absolutely seen. The road is a continued ant-hill, entirely covered with the eggs and remains of these little animals, upon which are seen myriads of ants running in all directions, to complete their daily labours." *Travels of Ali Bey, 1803-7.*

Referring to our article JERUSALEM, it is now proper to observe, that the Church of the Sepulchre no longer exists: it was destroyed by fire after M. de Chateaubriand's return from Judea, which was in the year 1807. "I am (says he) the last traveller by whom it was visited;

and, for the same reason, I shall be its last historian." *Travels in Greece, Palestine, &c. 1806, 7, published at Paris, in 2 vols. 8vo. 1811* — We may also add, as to the present state of Jerusalem, that it contains 9000 Mahometans, 3000 Jews, 2000 Greek Christians, 600 Latins, 300 Armenians, 100 Jacobites or Syrians, and two or three families of Copts or Maronites. *Professor Carlyle, in Walpole's Mem. relating to Turkey.*

About the year 1809, a society was formed, under the auspices of Dr. Hamilton, the Earl of Aberdeen, and Mr. Spencer Smith, to be called the "Palestine Association." Its object was to forward and assist discoveries in the interior of Syria and the Holy Land. Whether this society subsists at present we really do not know, as we have met with no report of its proceedings. Its plan was very laudable. The following are the various subjects to which the attention of the travellers, selected by the committee, to be sent into Syria, and other regions of the East, at the expense of the Association, were to be directed.

1. Astronomical observations, to ascertain the situations of the most remarkable places.
2. Ranges and heights of mountains.
3. Breadth and depth of rivers, with their courses, fords, and bridges; wells and fountains; whether of sweet, salt, or brackish, water.
4. Times and extent of inundations.
5. Every other observation relative to the geography and topography of Palestine, which may be of use in the formation of a more accurate map of the country than has hitherto appeared.
6. Process of agriculture in all parts.
7. To compose a meteorological journal, according to a form prepared for the purpose in England, and in which shall be comprised an accurate statement of the winds and temperature for the whole year, mentioning the place, time, and exposure.
8. A list of the natural productions of Palestine, with a description of the soil and situation of those that are more rare; particular attention to be paid to the culture and use of the date and the palm tree.
9. To observe the uses, of any kind whatever, to which the botanical productions of the country are applied; whether these uses are publicly known, or kept secret in particular families; and what is their medicinal or chemical value.
10. To detect the errors of former travellers.
11. To make accurate drawings of the implements of masonry, carpenters' work, and other handicrafts.
12. Substance and quantity of food consumed in the families of the inhabitants in the different situations in life.
13. Whence the neighbourhood of Jerusalem is supplied with fuel and timber for building.
14. To endeavour to trace the progress of the Israelites under Moses and Joshua, in their operations against the possessors of the Promised Land, and the subsequent distribution of the Tribes; verifying characteristic epithets given to the several countries mentioned in the Scriptures; and to continue the same observations throughout the whole of Palestine, with reference to the latter periods of the Jewish history.
15. To write in Arabic and English characters the name of every town, village, river, mountain, &c. by which the traveller may pass; and to observe the greatest accuracy in marking down their respective bearings, and their distances, in computed miles, and in hours.
16. The strictest attention must be paid to the draughts, plans, and sketches, of the country; and drawings to be made of those buildings which appear to be of importance, from their undoubted antiquity, or architectural peculiarities.
17. It would be extremely desirable to form an ample collection of inscriptions, manuscripts, and medals, and other valuable monuments of antiquity, whether Hebrew, Phœnician, Greek, or Roman.
18. Estimate

18. Estimate of the present population of Palestine, with details of the manners and customs of the inhabitants.

19. Vestiges of ancient cultivation in parts of the country now desolate and unproductive.

20. Weights; and measures of time, distance, and capacity.

21. The present modes of dividing the year and day in use among the Arabs, Turks, Christians of each denomination, and Jews; as well as the state of trade and manufactures within the limits of Palestine, and its vicinity.

PALESTRINA, one of the islands near the city of Venice, twelve miles long, but narrow. It contains a large market-town of the same name, and about 7000 inhabitants. It is six miles south of Venice.

PALESTRINA, a town of Italy, in the province of Campagna, anciently *Præneste*, near which formerly stood a temple dedicated to Fortune, and another to Hercules, in a bay on the west coast. It is the see of a bishop, who is also a cardinal. It is eighteen miles east-south-east of Rome. Lat. 41. 51. N. lon. 12. 49. E.

PALESTRINA (Giovanni Pierluigi da), a very eminent composer of church-music, was born in 1529, at Palestrina in Italy, the ancient *Præneste*. His instructor in the musical science is said to have been one Gaudio Mell, a Fleming, in which name some have recognised Claude Goudimel, a musician of Franche Comté, and a huguenot, who was one of the first that set the translation of the Psalms, by Clement Marot and Theodore Beza, to music; and who was murdered at Lyons in 1572, on the fatal day of the massacre of Paris. Who Mell was, if different from Goudimel, we know not; of his works or name we have met with no memorial.

Of Palestrina's early life nothing is known; but it appears, that in 1555 he was admitted into the pope's chapel in Rome. He had already formed that simple, grave, and noble, style for which he became so famous; for we are told that the pope and conclave, having been scandalized at the light and injudicious manner in which the masses had been usually set and performed, had determined to banish music in parts entirely from the church; but that Palestrina, at the age of twenty-six, during the pontificate of Marcellus Cervinus, interceded with his holiness to suspend the sentence till he should have heard a mass composed in a different style. Accordingly, at Easter 1555, he presented before the pope and cardinals his celebrated composition entitled "*Missa Papæ Marcelli*," which was heard by them with so much pleasure and admiration, that music in divine-service was restored to favour.

In 1562 Palestrina was elected chapel-master to the church of Santa-Maria-Maggiore, and in 1571 was appointed to the same office at St. Peter's. He opened a school of music at Rome, in conjunction with his friend and fellow-pupil Gio. Maria Nanino, and greatly contributed to establish the superior reputation of the Italian musicians. He died in 1594, and was interred at St. Peter's, whither his funeral was attended by all the musicians at Rome, and a great concourse of other persons. His own composition, "*Libera nos Domine*," was performed on the occasion. No musician has been mentioned with more honour by writers on the same science than Palestrina, who was undoubtedly a great and original genius. Although the inventions of fugue, canon, and other elaborate compositions, have been banished from dramatic music, they have been retained in the church, on account of their gravity and solemnity; and this composer, by his fine taste and admirable skill in harmony, brought choral music to a degree of perfection that (says Dr. Burney) has never been exceeded. The best church-compositions since his time, have indeed been proverbially called *alla Palestrina*, as professedly imitations of his manner. His works were numerous, and most of them are still extant. The principal of them are masses and motets. *Hawkins's and Burney's Histories of Music.*

PALESTRUM, a town of European Turkey, in Livadia: thirty-four miles north of Lepanto.

PALET, *f.* [*pelote*, Fr. a ball.] The crown of the head. *Obsolete.*

Then Elinour say'd, Ye calettes,
I shall breake your *palettes*,
Without ye now cease;
And so was made the drunken peace.

Shelton.

PALETTE, *f.* [Fr. from *plat*, a dish; or from *plat*, flat.] A light thin plate of wood or ivory, on which a painter holds his colours.—Let the ground of the picture be of such a mixture, as there may be something in it of every colour that composes your work, as it were the contents of your *palette*. *Dryden.*

PALEY (William), a justly-celebrated divine and philosopher, was born at Peterborough, in July 1743, of the cathedral church of which place his father was a minor canon. Soon after the birth of his son he was appointed head-master of Giggleswick school, in Yorkshire, to which place he removed. Young Paley was now educated under his father's eye; at school he soon surpassed his contemporaries, and at length obtained a pre-eminence over them all. He was even at this period more attentive to things than to words, and was ardent in the pursuit of knowledge of every kind. He was very curious in his enquiries about mechanism, whenever he had an opportunity of conversing with any workmen, or others capable of affording him information. In his *mind* he was uncommonly active; in his *body* quite the reverse.

Soon after he had completed his fifteenth year he accompanied his father to Cambridge, and was admitted a sizar of Christ's college, November 16, 1758. In October 1759, he became a resident member of Christ's college, and on the 5th of December he was appointed to one of the scholarships founded by Mr. Carr; was elected a scholar on the foundation of his college, and appointed to the exhibition founded by sir Walter Mildmay. At college he distinguished himself by his diligence and great proficiency, and attracted considerable notice in the university, at the first opportunities which he enjoyed of displaying his talents in the public schools. According to the system of education followed at Cambridge, students, about the middle of their third year, who are then called *senior sophs*, dispute in the schools on questions of natural and moral philosophy. In these exercises Mr. Paley discovered such extraordinary quickness and sagacity, that, whenever he was expected to enter the lists, the schools were crowded with auditors.

In 1763 he was admitted to the degree of B. A. having had the honour of appearing the first man of his year in the previous examinations. After he had thus become a graduate, being too young to enter into holy orders, he obtained the place of assistant in a school at Greenwich, which he retained about three years. In 1765 he became a candidate for one of the prizes given annually by the representatives of the university of Cambridge to senior bachelors, to the authors of the two best dissertations in Latin prose. The subject proposed was "*A Comparison between the Stoic and Epicurean Philosophy, with respect to the influence of each on the morals of a people.*" Mr. Paley took the Epicurean side, and obtained the first prize.

Being ordained a deacon at a proper age, he engaged himself as curate to Dr. Hinchliffe, then vicar of Greenwich, and afterwards bishop of Peterborough. Soon after this he left the academy, but continued to officiate in the church. In June 1766, he was elected a fellow on the foundation of Christ's college, which was worth about 100*l.* per annum, in consequence of which he returned to a residence in the university, took his degree of M. A. and engaged in the business of private tuition, which was soon followed by his appointment to the office of one of the college-tutors. On the 21st of December, 1767, he was ordained a priest by bishop Terrick.

The duties of college-tutor Mr. Paley discharged with uncommon assiduity and zeal. Not contented with following

lowing the usual method of college-lectures, by which the progress of a student is left to depend chiefly on his own industry, or private assistance, he endeavoured to introduce his pupils to an acquaintance with the most important truths by arguments and illustrations which were equally pleasing and forcible. His lectures on moral philosophy, and on the Greek Testament, contained the outlines of the works by which he afterwards so much benefitted the world, and extended his own reputation; and those works may be said to have owed their origin to the situation which imposed upon him the duty of delivering the lectures. Mr. Paley at this time acted in conjunction with Dr. John Law, the late bishop of Elphin, and son of the celebrated bishop of Carlisle. The exertions and talents of these kindred souls rendered Christ's college extremely popular; and, while they retained their offices, that society rose to a flourishing state, unequalled perhaps in the history of the university. To his engagements as a public tutor, Mr. Paley added others, still more numerous, as a private one; and by these united labours was in the receipt of a very considerable income.

Mr. Paley, after having spent about ten years in discharging these laborious duties, quitted the university in 1776, and married. His first benefice was the rectory of Musgrove in Westmoreland, worth only about eighty pounds a year: this was in the month of May 1775; and in December 1776, he was inducted into the vicarage of Dalston in Cumberland, after which he was presented to the living of Appleby in Westmoreland, worth about 300*l.* per annum; and in a short time he was promoted to a prebendal stall in the cathedral church of Carlisle. While vicar of Appleby, he gave the world a small volume, selected from the Book of Common Prayer, and the writings of some eminent divines, entitled "*The Clergyman's Companion in visiting the Sick.*" This was first published without his name; but it has passed through many editions, and is now printed among his works. In the year 1782, upon the resignation of Dr. Law, who was created an Irish bishop, Mr. Paley was made archdeacon of the diocese; and not long after he succeeded Dr. Burn, author of "*The Justice of Peace,*" in the chancellorship.

While his residence was divided between Carlisle and Dalston, Mr. Paley engaged in the composition of his celebrated work, "*The Elements of Moral and Political Philosophy.*" This production would probably have never seen the light, had not the instigations of Dr. John Law urged him to the undertaking. Mr. Paley for a considerable time objected to the risk of publishing, imagining there would be but few readers for a work on that subject; and he was the more determined on this point after he had entered on the married state, thinking it a duty that he owed his family, not to print a book that would probably not find purchasers. To remove the objection, a living having become vacant, of which Dr. Law had the disposal, he presented it to Mr. Paley, on the promise that he would consider it as a compensation for the hazard of printing; and he immediately set about preparing his work for the press. When the MS. was completed, he offered it to Mr. Faulder for 300*l.* which he refused, proposing 250*l.* as the full value. In the mean time the author was offered by another person in the trade 1000*l.* for the copy-right; he felt it his duty to give Mr. Faulder the refusal, rising, however, in his demands from 300*l.* to 1000*l.* which the publisher agreed to pay. In 1785 the work was brought out in 4*to.* with an excellent dedication to the bishop of Carlisle, bearing honourable testimony to the purity of the motives by which that prelate was actuated in his religious researches, and avowing sentiments which reflect the highest credit on the author's ingenuousness and liberality. Concerning this work, we may say, in the words of an able periodical critic, that "those who are fond of novelty, of ingenious theories, curious speculations, abstract and metaphysical notions, will find little in it to amuse or entertain them; but those

who are solicitous to have their consciences properly directed in the general conduct of human life, to see their duties and obligations delineated with perspicuity and accuracy, will be fully gratified." His reasoning on subscription to articles of religion, and on the British constitution, in which he disputes the expediency of reform in the house of commons, and vindicates the undue influence of the crown in that branch of parliament, is liable to great objection, and has been attacked, deservedly and severely, by persons of considerable reputation in the literary world. That the prevalent opinion of the public was, however, in favour of the value and utility of these *Elements*, may be presumed from the numerous impressions of them which were speedily demanded; (the sixteenth now lies before us;) and we think that whatever is objectionable in this work is infinitely counterbalanced by its very high general merits. The author's political speculations, in which his talents are most eminently displayed, have been studied, and quoted, and admired, by the most illustrious statesmen of modern times; and it was an enviable compliment which was paid him by the late Mr. Fox, during the debate in the house of commons on the Catholic question, in May 1805, after reading two passages from his work, "that no man who valued learning, no man who valued genius, no man who valued moderation, could hear his opinions without deference and respect."

On the death of the venerable bishop of Carlisle, in 1787, Mr. Paley drew up a short memoir of him, which has been inserted in Hutchinson's History of Cumberland, and in the *Encyclopædia Britannica*, and which, in 1803, was prefixed, with notes supposed to have been written by the Rev. Dr. Disney, to an edition of the bishop's *Reflections on the Life and Character of Christ*, intended for popular circulation.

The next work which Mr. Paley presented to the public, places him in a high rank among the advocates for the truth and authenticity of the Christian Scriptures. It is entitled "*Horæ Paulinæ; or, the Truth of the Scripture History of St. Paul evinced, by a Comparison of the Epistles which bear his Name, with the Acts of the Apostles, and with one another,*" which he dedicated to his friend Dr. Law, at that time bishop of Killala. The grand object of this work is to show, that, by a comparison of several *indirect* allusions and references in the Acts and Epistles, independently of all *collateral testimony*, their *undesigned coincidence* affords the strongest proof of their genuineness, and of the reality of the transactions to which they relate. The design was original, and the execution admirable. Notwithstanding the title, the utility of the work was not confined to the learned: the *Horæ Paulinæ* will furnish the common reader, as well as the biblical student, with ingenious criticisms and remarks, which will afford valuable assistance in the right understanding of St. Paul's Epistles.

Soon after the appearance of this work, Dr. Yorke, bishop of Ely, made an offer to Mr. Paley of the mastership of Jesus-college, Cambridge; in which the worthy prelate was solely influenced by the reputation of Mr. Paley's extraordinary talents, and by a wish to render them serviceable in a high academical situation. After deliberate consideration, he declined the honour intended him; but his sense of gratitude for his lordship's kindness he publicly expressed in a dedication, prefixed to his next work, which he published in 1794, and which is entitled "*A View of the Evidences of Christianity, in three Parts;*" first published in 3 vols. 12*mo.* but, after a few months, in 2 vols. 8*vo.* and has been continued in this form through many successive editions. It is perhaps the most complete summary of the evidences of our holy religion that has ever appeared. It also possesses the merit of offering a defence of Christianity, which every Christian may read without seeing the tenets peculiar to the sect to which he is attached in the least decried.

After the publication of the *Evidences of Christianity*, the bishop of London, Dr. Porteus, instituted him to the

prebend of St. Pancras, in the cathedral of St. Paul. This was in August 1794; and in a very short time he was promoted to the subdeanery of Lincoln, a preferment of 700l. per ann. by Dr. Prettyman, bishop of that diocese. In January 1795 he proceeded to Cambridge to take his degree of D.D. and, before he left that place, he was surprised by a letter from the bishop of Durham, Dr. Barrington, with whom he had not the smallest acquaintance, offering him the valuable rectory of Bishop-Wearmouth, estimated at 1200l. a-year. When he waited on his new patron to express his gratitude, his lordship instantly interrupted his acknowledgments: "Not a word," said he; "you cannot have greater pleasure in accepting the living of Bishop-Wearmouth, than I have in offering it to you." After reading himself in, as a prebend, at St. Paul's cathedral, March 8th, Dr. Paley, for he now assumed that title, immediately proceeded to Bishop-Wearmouth, took possession of his valuable cure, and then returned to Cambridge against the Commencement, to complete the doctor's degree, and on Sunday July 5th preached before the university his sermon "On the Dangers incidental to the Clerical Character." From this time he divided his residence principally between Lincoln and Bishop-Wearmouth, spending his summers at the latter, and his winters at the former, of those places. At Bishop-Wearmouth the principal land-owners, wishing to remove even the probability of future dispute, offered him an annual compensation for the tythes. He readily acquiesced, and granted them leases for his life; and thus, by sacrificing any eventual interest of his own in the agricultural improvement of the parish, avoided one great source of disquietude and vexation. In his writings he had already reprobated tythes as noxious to cultivation and improvement, and recommended their conversion into corn-rents, as a practicable and beneficial alteration, in which the interest of all parties might be equitably adjusted; and he now acted in conformity to these principles, leaving to the industry of his parishioners its full operation and entire reward.

He now undertook the composition of his last work, entitled "Natural Theology; or, Evidences of the Existence and Attributes of the Deity, collected from the Appearances of Nature." In this he proceeded very slowly, and was much interrupted by ill health. This work was published in the summer of 1802; it was dedicated to the bishop of Durham, for the purpose of making the most acceptable return he was able for a great and important benefit conferred upon him. "A weak, and of late a painful, state of health," he says, in his dedication, "deprived me of the power of discharging the duties of my station in a manner at all suitable either to my sense of those duties, or to my most anxious wishes concerning them. My inability for the public functions of my profession, among other consequences, left me much at leisure. That leisure was not to be lost. It was only in my study that I could repair my deficiencies in the church. It was only through the press that I could speak. These circumstances, in particular, entitled your lordship to call upon me for the only species of exertion of which I was capable, and disposed me without hesitation to obey the call in the best manner that I could. In the choice of a subject I had no place left for doubt: the following discourse alone was wanted to make up my works into a system; in which works, such as they are, the public have now before them, the evidences of natural religion; the evidences of revealed religion; and an account of the duties that result from both."

Mr. Meadley, to whose work we are greatly indebted for the facts in this article, says, he saw him for the last time in December 1804. His valuable life was then drawing fast towards a close; and the powers of nature, gradually exhausted by repeated sufferings, were becoming daily less able to resist the force of his disease. At length, on his return from his annual residence at Lincoln, early in the month of May 1805, he experienced a very violent

attack, in which the usual remedies were found ineffectual. He soon sunk under the accumulated influence of debility and disease. He met the approach of death with firmness, comforted his afflicted family with the consolation of that religion which he had so successfully taught, and on Saturday, May 25th, 1805, he breathed his last. His remains were conveyed to Carlisle, and were interred in one of the aisles of the cathedral by the side of his first wife, by whom he had eight children, viz. four sons and four daughters. His second wife survived him.

In private life Dr. Paley had nothing of the philosopher about him. He entered into little amusements with a degree of ardour, which, when contrasted with the superiority of his mind, had a pleasing effect, and constituted a very amiable trait of his character. He was fond of company, which he had extraordinary powers of entertaining; nor was he at any time more happy than when communicating the pleasure he could give, by exerting his unrivalled talents of wit and humour. No man was ever more beloved by his particular friends, or returned their affection with greater sincerity and ardour. As a divine, the great aim of Dr. Paley's labours was to maintain the authority of the Gospel as an authentic revelation, and to enforce the practice of virtue by the sanctions of a future life. His views of the Christian system were at once cheerful and enlightened, and in strict unison with the benevolent spirit of the founder. As an author, he is not remarkable for what is called fine writing; though in this he could excel, as is evident from certain parts of his Moral Philosophy, and the conclusion of the Natural Theology, which contains some passages scarcely to be excelled in the English language. He had higher objects in view; he wished to inform the understanding, and impress the heart with important truth; and for these purposes his style and method are admirably adapted. The general characteristics of his writings are plainness and simplicity; but there is, at the same time, both in his language and his ideas, a peculiarity of manner stamped by the vigour and independence of his mind, which cannot be borrowed, and which will therefore perpetuate his reputation. Dr. Paley was author of several other works besides those referred to; of these Mr. Meadley has given a complete catalogue. Since his death a collection of thirty-five Sermons has been published. In compliance with a codicil to his will they were at first printed and given away among the inhabitants of Bishop-Wearmouth. His family have since acquiesced in the general wish, and presented them to the world, as it would not have been possible to have prevented a surreptitious sale of them. *Monthly and Gent. Mag.* 1805. *Meadley's Memoirs of Paley*, 1810.

PALFA, a town of the duchy of Stiria: eighteen miles north of Leoben.

PALFREY, *f.* [*palefroi*, old Fr. Lacombe. "Cheval palefrotin, petit cheval fort et trapu, qui va l'amble.—Quand les poëtes et les romanciers ont à représenter une dame à cheval, ils la mettent toujours sur le palefroi."] A small horse fit for ladies: it is mostly distinguished in the old books from a war-horse.—The damsel is mounted on a white *palfrey*, as an emblem of her innocence. *Addison*.—The smiths and armorers on *palfreys* ride. *Dryden*.

Her wanton *palfrey* all was overspread
With tinsel trappings, woven like a wave. *Spenser*.

PALFREYED, *adj.* Riding on a palfrey:

Such dire achievements sings the bard that tells
Of *palfrey'd* dames, bold knights, and magic spells. *Tickell*.

PALFYN (John), a surgeon and anatomist of reputation, was born at Courtray in Flanders in 1649, or the following year. He settled in the practice of his profession at Ghent, where he obtained considerable reputation, and gave lectures to a number of pupils. Being extremely zealous for improvement, he visited Paris annually, and occasionally went to Leyden, and even to London,

to

to learn the novelties which were acquired in the practice of his art, in these great schools of medicine. He was the contriver of several improvements in the form of chirurgical and obstetrical instruments, and the author of several useful treatises on anatomy and surgery, which obtained considerable popularity. He died at Ghent in the year 1730, at the advanced age of eighty years.

His first work, published at Ghent in 1701, was a treatise on "Osteology," in Flemish; which was afterwards much enlarged by himself, and translated into German and French. It is particularly full relative to the bones of the head, and was cited with approbation by some of the most eminent professors of the time. In 1708, he published his "Description Anatomique des Parties de la Femme qui servent à la Génération," together with Licetus's Treatise on Monsters, and a description of one born at Ghent in 1703. This work is chiefly a compilation; but he has given some original observations on the course of the blood in the fœtus, and on monsters. In 1710, he printed his "Anatomie Chirurgicale, ou Description exacte des Parties du Corps humain, avec des Remarques utiles aux Chirurgiens dans la Pratique de leur Art," in French; and in 1718 reprinted it in Flemish. It was regarded as a valuable work, and was republished after his death, in France, Italy, and Germany. Palsyn also translated the treatise of Anthony Petit on Diseases of the Eyes, into Flemish, adding several other tracts on the same subject. *Gen. Biog.*

PALGUNGE, a town of Bengal: twenty-two miles south of Curuckdeah. Lat. 24. 3. N. lon. 86. 20. E.

PALIACUR', a town of the island of Ceylon, in a bay on the west coast: eighty miles north-north-west of Trinkamaly. Lat. 9. 33. N. lon. 80. 14. E.

PALIAPA'DA, a town of Hindoostan, in the Carnatic: fifteen miles south-south-west of Polore.

PALIA'R, a river of Hindoostan, which runs into the bay of Bengal four miles south of Sadras.

PALIBO'THRA, in ancient geography, a very considerable town of India, both with regard to extent and wealth, situated on the right bank of the Ganges, and at the confluence of a large river with it, which river Arrian calls *Erranobos*, inferior to none but the Ganges and Indus, and which Pliny denominates *Jomanes*, (*Jumnah*.) This ancient author says, in one place, that the *Jomanes* entered the Ganges by Palibothra, between Methora and Clisobara or Carysobara: but in another place he mentions the conflux of the Ganges and *Jomanes*; and in the next article says, that Palibothra is situated 425 miles below that point of conflux. Pliny's Palibothra, says major Rennel, is clearly *Patna*; and it is probable that Strabo meant the same place, by the distance from the mouth of the Ganges. Palibothra was the capital of the *Prasii*; and in dimensions eighty stadia in length and fifty broad, or about ten miles long and nearly two wide.

PALICATE, a sea-port town of India, on this side of the Ganges. It is seated on the coast of Coromandel, in the kingdom of Carnate, seventy miles north of Fort St. George. Here the Dutch had a factory, and a fort called the Fort of Guelderland. Lat. 13. 34. N. lon. 80. 1. E.

PALICAU'DCHERY, a strong town of Hindoostan, in the country of Calicut. This place was taken from Hyder Ali in the year 1783, by the British under Colonel Fullarton, after a long and vigorous defence, with a garrison of 4000 men. It was afterwards evacuated; but at the peace ceded to the English; and, as it commands the passage between the two coasts of Malabar and Coromandel, by way of the Trichinopoly and Coimbatore countries, it was of great importance to them, when Coimbatore was in the hands of Tippoo, because, by our holding this place on the west, and Dindigul on the east of Coimbatore, that province was of little use to him in the time of war, without a very large force to protect it. But the fall of that sovereign, and the reduction of his territories, have effected a total change of circum-

stances. (See Memoir of a Map of the Peninsula of India, by Major Rennel.) It is twenty-six miles south-west of Coimbatore, and seventy south-east of Calicut. Lat. 10. 58. N. lon. 76. 45. E.

PALICE GRE'AN, incorrectly written *Palice* or *Pallas Green*, a small post-town of the county of Limerick, Ireland. It is situated at the foot of *Knock Green*, the Hill of the Sun, which is remarkable for its basaltic pillars, about a mile from the village, towards Limerick. These pillars, though much inferior to those in the county of Antrim, are calculated to arrest the attention of the traveller, and have led to an examination of the hill, and of other parts of the county, which will probably be laid before the public. Palice Grean is twelve miles and a quarter east of Limerick, and about ninety-six south-west from Dublin.

PALICI, or PALISCI, two deities, sons of Jupiter by Thalia, whom Æschylus calls *Ætna*, in a tragedy which is now lost, according to Macrobius. The nymph *Ætna*, when pregnant, entreated her lover to remove her from the pursuits of Juno. The god concealed her in the bowels of the earth; and, when the time of her delivery was come, the earth opened and brought into the world two children, who received the name of Palici, *απο του παλιν ικεσθαι*, "because they came again into the world from the bowels of the earth." These deities were worshipped with great ceremonies by the Sicilians; and near their temple were two small lakes of sulphureous water, which were supposed to have sprung out of the earth at the same time that they were born. Near these pools it was usual to take the most solemn oaths, by those who wished to decide controversies and quarrels. If any of the persons who took the oaths perjured themselves, they were immediately punished in a supernatural manner; and those whose oath, by the deities of the place, was sincere, departed unhurt. The Palici had also an oracle, which was consulted upon great emergencies, and which rendered the truest and most unequivocal answers. In a superstitious age, the altars of the Palici were stained with the blood of human sacrifices; but this barbarous custom was soon abolished, and the deities were satisfied with their usual offerings. *Lempriere's Classical Dict.*

PALICON'DA, a town of Hindoostan, in the Carnatic: twenty-five miles west of Arcot.—A town of Hindoostan, in Travancore: fifty-five miles north of Anjenja.—A town of Hindoostan, in the circar of Gooty: twenty miles west of Gooty.

PALICOU'RE'A, *f.* in botany. See STEPHANIUM.

PALIFICA'TION, *f.* [*palus*, Lat.] The act or practice of making ground firm with piles.—I have said nothing of *palification*, or piling of the ground-plot, commanded by Vitruvius, when we build upon a moist soil. *Wotton.*

PALIFIS'CO, a town of Naples, in Lavora: five miles north of Sezza.

PALIGHERY, a town of Hindoostan, in the circar of Cuddapa: twenty-four miles west of Cuddapa.

PALIL'IA, a feast among the ancient Romans in honour of the goddess *Pales*. The *Palilia*, by some called *Parilia*, (*à pariendo*,) were celebrated by the shepherds on the day of the foundation of Rome, which, according to Cato, was the 11th of the calends of May, or the 21st of April, to beseech that goddess to take care of their flocks, and preserve them from wolves and diseases. On that day the people purified themselves, and also their folds and flocks, with water and brimstone, and burned the shrub called *savine*, whose smoke diffused itself all over the fold. After this, they offered in sacrifice to the goddess milk, boiled wine, and millet: then followed the feast. Part of the ceremony consisted in lighting heaps of straw, and jumping over them. Ovid (*de Fest. l. iv.*) describes this whole solemnity at full length. These ceremonies were accompanied with musical instruments, such as flutes, cymbals, &c.

PALIL'IA, *f.* in botany. See HELICONIA.

PALILIC'UM,

PALILICIUM, a fixed star of the first magnitude in the Bull's Eye; called also *Aldebaran*. Pliny gives the name Palilicium to the Hyades, of which the Palilicium is properly only one. See TAURUS.

PALIO'GIA, *f.* [from the Gr. *παλιον*, again, and *λογος*, a word.] A figure in rhetoric, in which the same word is repeated, to give it greater force or energy.

PALIMBACH'US, *f.* in poetry, a foot consisting of two long syllables and one short.

PALIMBAN'. See PALAMBAN.

PALIMER'DI, a town of Hindoostan, in Madura: thirty-five miles north-north-east of Coilpetta.

PALIN'DI, a town of Hindoostan: forty-five miles north of Travancore.

PALINDROME, *f.* [*palindromus*, Lat. from the Gr. *παλιν*, again, and *δρομος*, course.] A word or sentence which reads the same either backward or forward; as, *did, madam; Anna, Hannah*; or this sentence, "Lewd did I live, evil did I dwell."

Had I compil'd from Amadis de Gaul,
Or spun-out riddles, and weav'd fifty tomes
Of logoglyphes, and curious *palindromes*. *B. Jonson.*

Sentences of this kind thrown into metre have often been called *devil's verses*, no doubt from the legendary tale (with a Latin distich) which we have given under the article LONDON, vol. xiii. p. 425. and, as we there promised to renew this curious, difficult, but useless, subject, we shall now redeem our pledge.

1. Camden says: "A scholler and a gentleman living in a rude country-towne, where he had no respect, wrote this with a coale in the Towne-Hall: *Subi dura a rudibus*; Bear rude usage from rude people."

2. The following is also from Camden. "A noble lady in queene Elizabeth's time, being forbidden the court for being over familiar with a great lord, [not an Italian footman,] gave this embleme, the moon covered with a cloud, and underneath, *Ablata, at alba*; Taken from sight, but still white."

3. We find in Camden's Remains the following sarcastic palindrome upon a lawyer: he is made to say to his client, *Si munni, immuni*; "Give me my fee, and I warrant you free."

4. On the christening-font at Harlow in Essex, Sandbach in Cheshire, also on the holy-water shell at the entrance of St. Etienne des Grès at Paris, we find this curious Greek palindromical sentence: *Νιχον ανομημα, μη μοναν οφιν*; "Wash not thy face only, but also thy sin." This appropriate sentence is said, upon good authority, to have been originally written on the margin of the holy-water basin at the church of Sancta Sophia, built by the emperor Constantine at Byzantium, called afterwards Constantinople. It is moreover said to be copied from the 6th book of the Anthologia, which contains ten more verses of the same extraordinary kind. The author of the "Dictionnaire de Paris" affirms that it is not in the Anthologia, neither is it a verse. We have not the Anthologia at hand, to ascertain the former fact; and, as to the latter, it is certain that it is not an hexameter nor a pentameter; yet, as the Greek verses are of various kinds, it may still be a verse, or a part of one.

5. In the following example, also from Camden, it must be observed, that the hexameter line is not only palindromical, but that every component word reads the same backwards as forwards:

Odo tenet mulum, madidam mappam tenet Anna.
Anna tenet mappam madidam, mulum tenet Odo.

"Odo (the hostler) holds the mule; Anna (the maid) holds a wet napkin, or dishclout." Or, "Anna holds the wet napkin; Odo holds the mule."

6. An epitaph on Henry IV. of France, by Panchasius, seems to have given the author a great deal of trouble, and certainly would give a great deal more to any one who should attempt to translate it. It is an elegiac distich:

Arca, serenum me gere regem, munere sacra,
Solem, aulas, animos, omina, falva, melos.

7. The following verse is from Misson's Voyage to Italy, vol. ii. *Sacrum pinque dabo, non macrum sacrificabo*; "I will give a fat offering, not a lean sacrifice." This is copied from the old cloister of St. Maria Novella at Florence; where it is applied to the sacrifices of Cain and Abel. The above hexameter verse applies to Abel; but, read backward, not by letters but by words, and altering the punctuation, it will produce a pentameter verse applicable to Cain; thus: *Sacrificabo macrum, non dabo pinque sacrum*. "I will give a lean sacrifice, not a fat offering."

It might appear to be no very difficult matter to form a verse that would make good sense with merely the words reversed. Yet those who might choose to try the experiment would find it perhaps not easy to form a Latin hexameter, which, read backward, becomes a pentameter; each verse also to form a sentence well adapted to the character of the party supposed to utter it. Add to this, that both are *lequine verses* also, the middle and end of each rhyming to one another.

8. Many things of this kind would no doubt be discovered, were the discovery considered worth the pains of seeking for them. The two following were sent us a few days ago: they evidently allude to the present "indelicate investigation" into the conduct of the queen of England. — *O! Regem non me gero*; "I do not behave myself as a king." — *Regina laniger*; "The queen, a lamb!"

9. Although our Gallic neighbours are considered to be fond of, and skilful in, all sorts of futile amusements, we do not recollect any French palindromic composition; the reason is, perhaps, that few French words end with a bare consonant, and that most of them are long compound ones. It is remarkable, however, that many French words, read backwards, give English ones: *rat*, tar; *net*, ten; *reve*, ever; *fi*, if; *seton*, (a rowel,) notes; *on*, no; *si*, is; *par*, rap; *edit*, tide; &c. &c. We must however notice a most common, but also most unheeded, palindromic expression in the French tongue; *mon nom*, which reads reciprocally; also *Noyon*, a town of France; and we doubt not that many more might be discovered.

As a sort of appendage to the foregoing observations, we must subjoin two Latin hexameter verses which were interchanged between two boys at a French school. The first sent the following line to his friend; *Mitto tibi navem puppi prorique carentem*; "I send you a ship without either stern or prow." The meaning is: I send you *ave*; the word *navem* being stripped of its first and last letters, (the prow and the stern,) leaves *ave*, "all hail, or health." The other boy answered in a palindromical way, and sent; *Mitto tibi metulas, eandros imitare legendo*; "I send you metulas (a word of no sense in this case, since the first syllable of *metula*, from *meta*, a mark, a measure, is long); but imitate the crab, i. e. read it backward, then you have *salutem*; and the line means clearly, "I send you greeting; good health."

10. We have seen but one English sentence of the palindromic kind, which is quoted at the head of this article. We have indeed some pleasure in finding that these *difficiles nugæ* make no figure in our language.

PAL'ING, *f.* A kind of fence-work for parks, gardens, and grounds:

To every house belongs a space of ground,
Of equal size, once fenc'd with *pal'ing* round. *Crabbe.*

PAL'ING-MAN, *f.* This word, mentioned in stat. 22 Edw. IV. c. 23. and 11 Hen. VII. c. 23. seems to be a merchant-denizen, or one born within the English *pale*. But Skinner judges it to be a fishmonger, or merchant of fish. *Cowell.*

PALIN'GE, a town of France, in the department of the Saône and Loire, situated on the Charollois canal; seven miles north-north-west of Charolles, and fifteen south of Montcenis.

PALIN.

PALINGENE/SIA, *f.* [Greek; formed of *παλις*, anew, and *γενεσις*, generation.] New birth, or regeneration. It is also used by some for the migration or passage of the soul of a deceased person into another body; and is almost the same thing with the metempsychosis taught by Pythagoras, and still believed by the Brahmans, Banjans, and other philosophers of the east.

PALINGENESIA is used among chemists for the reproducing a mixed body from its ashes. This has been pretended to by many, as well as the philosopher's stone, and other wonderful powers; but, as to the palingenesia, or resuscitation of plants, the instances produced are no more than some of those artificial vegetations which the learned Monf. Homberg has observed and described many times. See Homberg in *Mem. Acad. Sciences*, 1710. Boyle's Works abridg. vol. i. p. 69. and Sibby's Astrology, p. 1114, 15.

PALINGE/NIUS (Marcellus), a modern Latin poet, who flourished about the beginning of the sixteenth century, was probably a native of Stellata in the Ferrarese, whence he added *Stellatus* to his name. It has been supposed that his true name was Pier-Angelo Marizolli, of which his Latin appellation is the anagram. Some have imagined that he was physician to Hercules II. duke of Ferrara, to whom the work for which he is celebrated is inscribed. This is his poem entitled "*Zodiacus Vitæ*; i. e. de Hominis Vita, Studio, ac Moribus, optimè instituendis, Lib. XII." It derives its title of the Zodiac of Life, from its division into twelve parts, each inscribed with one of the signs of the zodiac. This performance, of which the professed purpose is to guide men in the road to present and future happiness, is interspersed with many invectives against the court and church of Rome, the monks, and clergy; whence the author is supposed to have been one of those converts to the reformation who frequented the court of the dukes of Ferrara, sister of Francis I. This poem was placed in the first class of prohibited books in the Index Expurgatorius; and it is affirmed that, after his death, his body was dug up and burned; but very little seems to be known with certainty of his person and life. The *Zodiacus* is spoken of very differently by different critics, some allowing it no merit of plan and little of execution, while others call it a fine poem, that deserves to be more read. The editions of it have been numerous. The best is that of Rotterdam, 8vo. 1722. It has been translated into French. *Bibliogr. Diæ.*

PALINGUIR', one of the Philippine islands, about fifteen miles in circumference, situated to the north of Cape Engano, on the island of Luçon.

PALINODE, or **PALINODY**, *f.* [from the Gr. *παλις*, anew, and *ωδη*, a song.] A discourse contrary to a preceding one. Hence the phrase *Palinodiam canere*, "to sing palinody," q. d. to make a recantation. And thus it has passed as a general name for any poem, or the like, which contains a retractation in favour of a person whom the poet before had offended.—The poet Stesichorus is said to be the first author of the *palinody*. The sixth ode of the first book of Horace, beginning "*O matre pulchra*," is a true *palinody*. Chambers.—He was suspended from all execution of his priestly function within the university, till he should make his *palinodie*. A. Wood's *Annals Univ. Ox.* anno 1640.

You, two and two, singing a *palinode*,
March to your several homes.

B. Jonson.

PALINTO/CIA, *f.* [Gr. formed from *παλις*, anew, and *τοκος*, of *τιδω*, I bring forth.] In antiquity, the birth or delivery of a child a second time. Thus the second birth of Bacchus, proceeding out of Jupiter's thigh, was a *palintocia*.

PALINTOCIA is also used for the restitution of usury, or the refunding of interest. The Megarens, having expelled their tyrant, ordained the *palintocia*; that is, they

made a law, that all the creditors should return to their debtors the interest they had received for money lent.

PALINUM, a cape on the coast of Naples, in lat. 40. 2. N. lon. 15. 10. E.

PALINU'RUS, in fabulous history, Æneas's pilot, whose fate Virgil very particularly describes. He fell into the sea when asleep; and was three days exposed to the tempests and its agitation, and at last came safe ashore, when the cruel inhabitants of the place murdered him to get his clothes. His body was left unburied on the sea-shore; and since, according to the religion of the old Romans, no one could cross the Stygian lake before 100 years were elapsed, if his remains had not been decently buried, we find Æneas, when he went down to hell, speaking to Palinurus, and assuring him, that, though his bones were deprived of a funeral, yet the place where his body was exposed should soon be adorned with a monument, and bear his name; and, accordingly, a promontory was called *Palinuri Promontorium*, with a cognominal port, (now *Palinuro*;) it was situated at the south extremity of the Sinus Pæstanus, on the coast of Lucania.

PALISA'DE, or **PALISA'DO**, *f.* [Fr. and Span. *palus*, Lat.] Pales set by way of inclosure or defence.—Wood is useful for *palisadoes* for fortifications, being very hard and durable. *Mortimer's Husb.*—The city is surrounded with a strong wall, and that wall guarded with *palisades*. *Broome on the Odyssey.*

The Trojans round the place a rampire cast,
And *palisades* about the trenches plac'd. *Dryden.*

PALISADE, in fortification, an inclosure of stakes or piles driven into the ground, each six or seven inches square, and nine or ten feet long, three of which are hid underground. They are fixed about three inches asunder, and braced together by pieces nailed across them near the tops, and secured by thick posts at the distance of every four or five yards. Palisades are placed in the covert-way, at three feet from, and parallel to, the parapet or ridge of the glacis, to secure it from being surprised. They are usually planted perpendicularly; though some make an angle inclining towards the ground next the enemy, that ropes cast over them, to tear them up, may slip.

Turning Palisades are an invention of M. Coehorn, in order to preserve the palisades of the parapet of the covert-way from the besiegers' shot. They are so ordered, that as many of them as stand in the length of a rod, or about ten feet, turn up and down like traps, so as not to be in sight of the enemy till they just bring on their attack, and yet are always ready to do the proper service of palisades.

Palisades shod with iron are used in shallow streams and marshes, to prevent small craft from plying, or persons from crossing them on foot.

PALISADE, in gardening, denotes a sort of ornament; being a row of trees which bear branches and leaves from the bottom, cut and spread in manner of a wall, along the side of an alley, or the like; so as to appear like a wall covered with leaves. These palisades are made of jessamine, phillyrea, &c.

To **PALISA'DE**, *v. a.* To inclose with palisades.

PA'LISH, *adj.* Somewhat pale.—Spirit of nitre makes with copper a *palish* blue; spirit of urine a deep blue. *Arbutnot on Air.*

Crete, ever wont the cypress sad to bear;
Acheron banks, the *palish* poplar. *Bp. Hall's Sat.*

PALIS'SE, a town of France, in the department of the Allier: ten miles north east of Cusset, and nine south-west of Donjon.

PALISSE', *adj.* In heraldry, a range of palisades before a fortification represented on a fesse, rising up a considerable height, and pointed at top, with the field appearing through them.

PALISSY' (Bernard de), an ingenious artist, and proficient in natural philosophy, was born at Agen, a city

of France, about the year 1524. He was brought up to the trade of a potter, which he carried on at Saintes; and he was also employed as a surveyor and draughtsman of plans. A thirst for instruction led him to travel; and, having by accident got possession of a cup of enamelled pottery, his whole attention was turned upon endeavouring to imitate it. For this purpose he commenced a series of experiments that absolutely impoverished him; he even broke-up his furniture to supply his furnaces with fuel, and sold his clothes to furnish his assistant operator with wages. At length his labours were crowned with success; and he so perfected himself in the manufacture, that he was immediately raised to the head of his profession. He now pursued the science of chemistry, and applied his knowledge to the improvement of agriculture. He was the first person who formed a collection of natural history at Paris, upon which he gave lectures at the rate of half-a-crown each person, a large sum for that period; but he entered into an obligation to return the money four-fold, provided it were found that he taught any thing that proved false. In 1563 he printed at Rochelle "Recepte veritable par laquelle tous les Hommes de la France pourront apprendre à augmenter leur Trésors," &c. which, after his death, was reprinted under the title of "Moyen de devenir riche," in two vols. 8vo. In 1580, he published "Discours admirable de la Nature des Eaux et Fontaines, des Métaux, des Sols, des Salines, des Pierres, des Terres," &c. This work was exceedingly valuable in the then-existing state of knowledge; and in it he first taught the true theory of springs, and asserted that fossil shells were real sea-shells deposited by the waters of the ocean. He also pointed out the use of marl and of lime in agriculture. This excellent man was sincerely and ardently attached, with regard to religion, to the principles of Calvinism, on account of which he was, in the reign of Henry III. in 1584, apprehended and committed to the Bastille. The monarch, who, it appears, had a true regard for him, plainly said, that, if he did not comply with the prevailing religion, he should be constrained to leave him in the hands of his enemies; to which Palissy replied, with energy, "Your majesty has often said that you pity me; for my part, I pity you for pronouncing the words *I shall be constrained*. This is not speaking like a king; but, let me inform you, in royal language, that neither the Guisards, your whole people, nor yourself, shall constrain a potter to bend his knee before images." He used commonly to say, in allusion to his religion and his trade as a potter, "I have no other property than heaven and earth." Such are the only facts known of this estimable citizen: the time of his death is not ascertained. A new and complete edition of his works was published at Paris in 1777, with notes, by Faujas de Saint-Fonds. *Gen. Biog.*

PALIURI. See CAPE PALIURI, vol. iii.

PALIURO AFFINIS. See PRISONIA and VOLKAMERIA.

PALIURUS. See RHAMNUS.

PALIURUS, in ancient geography, now *Nahil*, a river of Africa, with a town of the same name at its mouth, at the west of Egypt, on the Mediterranean.

PALIUS, or PALIURUM LA'CUS, a small but very remarkable lake of Sicily, in the Val di Noto, two miles west from the town of Palagonia, and only one from Mineo, whence it is sometimes called the Lake of Mineo. It is surrounded by volcanic mountains, and lies in a small plain somewhat hollow towards the middle. This plain is half surrounded by steep rocks, which give it the appearance of a monstrous crater that has sunk down by some convulsion. The lake is placed in its centre, and, as it were, in the middle of a funnel. Its depth often varies, and consequently its circumference. In the winter-time it may be about sixty or seventy fathoms in diameter, and about ten in depth; but in summer, when great drought prevails, it is often entirely dry. Mons. Dolomieu visited it in the month of May, 1798, at which

period it formed an oval about thirty fathoms in length and twenty in breadth: its depth was about five or six. It had a strong smell of Jew's pitch, or asphalt, even at a considerable distance. The water in its colour inclined a little to green, and had an exceedingly nauseous and disagreeable taste. "I was told that the water was often tepid; but it had, at the time when I examined it, the temperature of the atmosphere. In several parts of it I observed a violent bubbling, and particularly in four places near the middle. This bubbling was stronger at certain intervals, and the water was thrown up sometimes to the height of two or three feet, rising in this manner every five or six minutes.

"When the lake is dry, one may without danger examine its centre, where there are several deep holes. From these holes currents of air, somewhat warm, continually arise, and throw back sand and other bodies, if put into them. It is this æriform vapour which, when the basin is full, forces up the water, and makes it to be covered with foam. The mud at the bottom and on the bank, which has a black colour, is tenacious, and smells like pitch. A little petroleum has also been sometimes found at the surface of the water. The whole soil of the small plain consists of black, tough, resinous, inflammable, earth. A few years ago, some straw huts in this neighbourhood having been set on fire, the fire was communicated to the ground, which burnt with a whitish dull flame, like that of the inflammable springs in Dauphny, during several months, and was extinguished with the greatest difficulty, as the fire, when quelled in one place, broke out in another. Since that period great care is taken not to kindle fire in the neighbourhood. From this phenomenon I am induced to think, that the air which rises through the water of the lake, and which probably finds a passage through the ground, may be of an inflammable nature also; as the air of marshes, which burns without any noise.

"The fertility of this small plain is so great, that it produces a most abundant crop every year, without requiring much agricultural care. In walking over the ground, a hollow noise is heard; which seems a proof of there being beneath the surface subterranean cavities, like those of Solfatara near Puzzuolo; and there is reason to think that this place has been formed from the remains of a fallen crater, a part of which is still seen in the surrounding mountains; and between this lake and that of Agnano near Naples, there is no other difference than the greater quantity of water in the one, and the more violent efflux of vapour in the other. The vapour which rises from the ground is considered as of a suffocating nature; so that people who lie down on the earth, or only bend their bodies towards it, are exposed to the greatest danger; though one may walk over it without the least fear. All these phenomena have a great similarity to those of the Grotto del Cane, near the lake Agnano.

"On the banks of the lake Palus are found a great many small clusters of ashes and slag, exactly like those adhering to the sides of the craters of Ætna and Vesuvius. The mountains and lava round this lake exhibit the most evident marks of their great antiquity, as in many places they are covered with calcareous stones, from which it may with certainty be inferred, that they must have originated at a time when the present continent was not inhabited. In the time of Diodorus Siculus, however, the crater, which forms the present basin of the lake, showed traces of its internal inflammation: as we are informed by this historian, that flames burst forth from this spot; that the water possessed a considerable degree of warmth; and that a horrid thundering noise was heard. The phenomena of this lake have at all times been attended with so many singularities as to give rise to fables without number: at present it is said to be inhabited by a fairy. In ancient times, these phenomena were ascribed to the supernatural power and influence of some deity. On this account, a very celebrated temple, the remains of which I could

I could not find, notwithstanding all the trouble I took to discover them, was erected here to Jupiter and the nymph Thalia. People swore also by this lake, with the same respect and solemnity as by the river Styx. What astonished the ancients, and what even at present excites the wonder of all those who visit this lake, is the incessant ebullition of the water, though the least increase is not observed in it on the bank."

PALIZEU'L, late a town of France, in the department of the Forests: eighteen miles north-north-east of Sedan.

PALIZ'ZI, a town of Naples, in Calabria Ultra: three miles east of Reggio.

PALKA'NE, a town of Sweden, in the province of Tavastland: twenty-three miles north of Tavasthus.

PALL, *f.* [pæll, Sax. *pallium*, Lat. from the ancient Sueb. *fala felu*, to cover. *Serenius*.] A cloak or mantle of state:

As fair Aurora in her purple *pall*,
Out of the east the dawning day doth call;
So forth the comes.

Spenser.

Let gorgeous tragedy
In scepter'd *pall* come sweeping by.

Milton.

For vest of *pall*, thy fingers smail,
That wout on harp to stray,
A cloke must sheer from the slaughter'd deer,

To keep the cold away. *Lady of the Lake.*

The mantle of an archbishop. See PALLIUM.—An archbishop ought to be consecrated and anointed; and, after consecration, he shall have the *pall* sent him. *Ayliffe*.—The covering thrown over the dead:

The right side of the *pall* old Egeus kept,
And on the left the royal Theseus wept.

Dryden.

To PALL, *v. a.* To cloak; to invest:

Come thick night,
And *pall* thee in the dunest smoke of hell,
That my keen knife see not the wound it makes. *Shakespeare.*

To PALL, *v. n.* [a corruption of *pale*, and applied originally to colours.] To grow vapid; to become insipid.—Empty one bottle into another swiftly, lest the drink *pall*. *Bacon*.

Beauty soon grows familiar to the lover,
Fades in the eye, and *palls* upon the sense. *Addison*.

To be weakened; to become spiritless; to grow flat:
Our indiscretion sometimes serves as well,
When our deep plots do *pall*. *Shakespeare's Hamlet*.

To PALL, *v. a.* To make insipid or vapid.—Reason and reflection, representing perpetually to the mind the meanness of all sensual gratifications, blunt the edge of his keenest desires, and *pall* all his enjoyments. *Atterbury*.

Wit, like wine, from happier climates brought,
Dash'd by these rogues, turns English common draught,
They *pall* Moliere's and Lopez' sprightly strain. *Swift*.
To make spiritless; to dispirit:

A miracle

Their joy with unexpected sorrow *pall'd*. *Dryden*.
Base barbarous man! the more we raise our love,
The more we *pall*, and cool, and kill his ardour. *Dryden*.

To weaken; to impair.—I'll never follow thy *pall'd* fortunes more. *Shakespeare*.—To cloy.—*Palled* appetite is humorous, and must be gratified with sauces rather than food. *Tatler*.

PALL, *f.* Nauseating. *Not in use*.—The *palls*, or nauseatings, which continually intervene, are of the worst and most hateful kind of sensation. *Ed. Shaftesbury's Inq.*

PALL, a circar of Hindoothan, in Guzerat, south of Oudipour.

PAL'LA, a small island in the Eastern Indian Sea. Lat. 3. 4. N. lon. 125. 28. E.

PALLA, *f.* in Roman antiquity, a mantle which women wore over the gown called *stola*. It was borne on the left shoulder; whence, passing to the other side, under the right arm, the two ends were bound under the left arm, leaving the breast and arm quite bare. It had a great many folds, and derived its name from *πᾶλλω*, to shake or tremble, as agitated by the wind.

PALLADIA, *f.* in botany. See FUCHSIA excortica.

PALLADINO (James), a singular theological writer, more commonly called *James de Teramo*, from the name of the city, in the Farther Abruzzo, where he was born in 1349. He embraced the ecclesiastical life; and became successively bishop of Monopoli, archbishop of Tarentum, of Florence, and of Spoleto. He also filled the post of administrator of the duchy of Spoleto, under Alexander V. and John XXIII. In the year 1417, he was sent into Poland, in the character of papal legate; and he died there in the same year, about the age of sixty-eight. He was the author of some extraordinary books, which were very popular in his day, and were peculiarly adapted to the taste of such a barbarous age. The most famous of them is a pious romance, entitled "Jacobi de Teramo Compendium perbreve, Consolatio Peccatorum nuncupatum, et apud nonnullos *Belial* vocitatum: id est, Processus Luciferi contra Jesum." This work was printed at Augsburg in 1472, folio, and frequently afterwards; and was translated into almost all the languages of Europe. *Ladvoeat's Dict. Hist.*

PALLADIO (Andrea), a famous Italian architect, was born at Vicenza in 1518, of parents in the middle rank of life. As an artist he first exercised himself in sculpture, probably in an humble walk; and it appears to have been the poet Trissino, who, first discovering his genius for the arts, gave him instructions in mathematical science, and explained to him the works of Vitruvius. He soon obtained distinction as an architect; and, having accompanied Trissino to Rome, he set himself to examine with great diligence all the remains of ancient edifices in that capital, and formed his taste upon them. He visited several other parts of Italy; and in 1547 returned to Vicenza, where he found the magistrates occupied about the reparation of their Basilic, or court of justice. His plan for this great work was approved, and the conduct of it was committed to him. His reputation caused him to be sent for to Venice, where he built the palace Foscari, in the style of pure antiquity. He was employed for other works in the same city, among which was a refectory and church for the monastery of St. Giorgio Maggiore. Several other Italian cities were afterwards decorated with magnificent edifices, public and private, of his construction; and he was invited to the court of Emanuel-Philibert duke of Savoy, who received him with distinguished honours. No architect has given more plans than Palladio; and to him is principally attributed the classic taste which reigns in so many of the buildings of Italy. His masterpiece is esteemed to be the Olympic Theatre at Vicenza, in imitation of that of Marcellus at Rome. He died in that city of an epidemic disease in 1580, at the age of sixty-two, and received a splendid funeral in the church of the Dominicans.

Palladio was of a good presence, cheerful, modest, the friend of all men of talents, and affable towards the workmen, whom he willingly instructed in points where they were ignorant. His memory is highly honoured by the votaries of the fine arts; and the dignified simplicity and purity of his taste has given him the appellation of The Raphael of Architects. He improved his art, not only by his edifices, but by his writings, which are standard performances. 1. His Treatise on Architecture, in four books, was first published at Venice in 1570, folio; and has been several times reprinted. A magnificent edition, in 3 vols. folio, was published at London in 1715, in Italian, French, and English. Another, equally splendid, has since been published at Venice, in 4 vols. folio, with the addition of his inedited buildings. 2. Lord Burlington

ton published in London, in 1730, a volume entitled *I Disegni delle Terme Antiche di Andrea Palladio*. 3. *Le Antichità di Roma*, not printed till after his death. 4. He illustrated Cæsar's Commentaries, by annexing to Badelli's translation of that work a long Preface on the Military System of the Romans, with copper-plates, designed for the most part by his two sons, Leonida and Orazio, who both died soon after. *D'Argenville Vies des Archit.*

PALLA'DIUM, in antiquity, a statue of the goddess Pallas. It was about three cubits high, and represented the goddess sitting, and holding a pike in her right hand, and in her left a distaff and a spindle. It fell down from heaven near the tent of Ilus, as he was building the citadel of Ilium. Some however suppose that it fell at Pessinus in Phrygia; or, according to others, Dardanus got it as a present from his mother Electra. There are some who maintain that the Palladium was made with the bones of Pelops by Aboris; but Apollodorus says, that it was no more than a piece of clock-work, which moved of itself. However various the opinions of ancient authors be about this celebrated statue, it is universally allowed, that on its preservation depended the safety of Troy. This fatality the Greeks, during the Trojan war, were well aware of; and therefore Ulysses and Diomedes were commissioned to steal it. This they effected; and, if we can rely upon the authority of some, they were directed how to carry it away by Helenus, a son of Priam, who in this betrayed his country, because his brother Deiphobus, at the death of Paris, had married Helen, of whom he was enamoured. Minerva was enraged at the violence offered to her statue; and, according to Virgil, the Palladium itself seemed to have received life and motion, and, by the flashes which started from its eyes, and sudden springs from the earth, it seemed to show the resentment of the goddesses:

Scarce to the camp the sacred image came,
When from her eyes she flash'd a living flame;
A briny sweat bedew'd her limbs around,
And thrice she sprung indignant from the ground;
Thrice was she seen with martial rage to wield
Her ponderous spear, and shake her blazing shield. *Æn. ii.*

After all, it is pretended by some, that the true Palladium was not carried away from Troy by the Greeks, but only a statue of similar size and shape, which was placed near it, to deceive whatever sacrilegious persons attempted to steal it. The Palladium, therefore, as they maintain, Æneas conveyed safe from Troy to Italy, and it was afterwards preserved by the Romans with the greatest secrecy and veneration in the temple of Vesta; a circumstance which none but the vestal virgins knew. It was esteemed the destiny of Rome; and there were several others made perfectly like it, to secure it from being stolen.

PALLA'DIUM, *f.* [see the preceding article.] Any security or protection.—A kind of *palladium* to save the city, wherever it remained. *Milton*.—The Jebusites said they should not come into the house, that is, they would never again commit the safety of the fort to such *palladiums* as these. *Gregory's Notes on Script.* 1684.

PALLA'DIUM, *f.* A simple substance, and a metal. This metallic substance was discovered by Dr. Wollaston in 1803. See the article **MINERALOGY**, vol. xv. p. 506, 7.

PALLA'DIUS, an eastern prelate and ecclesiastical writer, was a native of Galatia, and born about the year 368. While a very young man he began to travel in foreign countries; and, coming to Alexandria in Egypt, he determined to embrace the monastic life. He spent three years under the discipline of Dorotheus, a celebrated ascetic of Thebes; and in 391 he visited the monasteries and most celebrated solitaries in the desert of Nitria. At length, having wandered over almost the whole of Egypt, he was obliged, by the infirm state of his health, to quit that country, and retire to Palestine.

In the year 400, or 401, he went into Bythinia, where he was ordained bishop of Helenopolis. It is by no means certain whether Palladius, author of the "*Lausiac History*," and Palladius, author of "*A Dialogue of the Life of St. Chrysostom*," written in 408, were different persons, or one and the same. Dupin reckons these works to have been written by the same hand; Tillemont and Fabricius think them the productions of different persons. The facts already cited, are taken from the *Lausiac History*, so called from Lausus, a man of eminence in the imperial court at Constantinople, to whom it is inscribed.

Upon the supposition that it was the same Palladius, the author of the *History*, who wrote the *Dialogue*, the following particulars may be added. He was ordained by St. John Chrysostom, to whose party he attached himself; and, upon the banishment of Chrysostom, in 404, Palladius fell under persecution; and, being obliged to withdraw from his see, retired into Italy, and took refuge at Rome. Some time after, venturing to return into the east, he was banished to Syene, at the southern extremity of Egypt. Having regained his liberty, he resigned the see of Helenopolis, and was appointed to the bishopric of Aspona in Galatia. It is not certain when he died; but it was probably some time before the year 431, since Eusebius, his successor at Aspona, presided at the council of Ephesus, which was held in that year. He wrote the "*Lausiac History*" about the year 421, which contains the lives of persons who at that time were eminent for their extraordinary austerities in Egypt and Palestine. The style in which it is written is plain and simple; the first edition of it, in Greek, was published by Meursius at Leyden, in 1616. In several manuscripts, there is subjoined to the *History* a book "*Concerning the Nations of India and the Brahmins*," which has been attributed to Palladius, but without any proof. Cave says, nothing more can be affirmed of this work, than that it is the production of some Christian writer who lived before the destruction of the Roman empire. *Lardner*, vol. xi. *Cave's Hist. Lit.* vol. i.

PALLANDROS, a town of the island of Cyprus, situated at the foot of the mountain of St. Croix; anciently called *Palea*: twenty-four miles north of Limasol.

PALLANTEUM, in ancient geography, a town of Italy, or perhaps more properly a citadel, built by Evander on Mount Palatine, from whence its name originates. Virgil says, it is called after Pallas, the grandfather of Evander; but Dionysius derives its name from Palantium, a town of Arcadia.

PALLANTIA, in ancient geography, a town of Hither Spain, in the country of the Vaccæi, on the river Cea; distinguished, according to Appian, by the valour of its inhabitants. Now **PALENCIA**.

PALLANTIAS, a patronymic of Aurora, as being related to the giant Pallas. *Ovid. Met.*

PALLANTIDES, the fifty sons of Pallas, the son of Pandion, and the brother of Ægeus. They were all killed by Theseus, the son of Ægeus, whom they opposed when he came to take possession of his father's kingdom. This opposition they showed in hopes of succeeding to the throne, as Ægeus left no children except Theseus, whose legitimacy was disputed, as he was born at Træzene. *Plut. in Thest.*

PALLANTIUM, a town of Arcadia, north-east of Megalopolis, and at the extremity of a plain, which, being enfeebled by a colony detached to Megalopolis, became a village in the time of the emperor Antonine, who embellished it with some fine edifices in honour of Pallas, Ceres, and Proserpine, freed it from every kind of imposition, and gave it entire liberty.

PALLAS, in fabulous history, the son of Pandion, (see the preceding article,) and father of Clytus and Butes. *Ovid. Met.* vii. 17.

PALLAS, a son of king Evander, sent with some troops to

to assist Æneas. He was killed by Turnus, the king of the Rutuli, after he had made a great slaughter of the enemy. *Virg. Æn.*

PALLAS, one of the giants, son of Tartarus and Terra. He was killed by Minerva, who covered herself with his skin; whence, as some suppose, she is called Pallas.

PALLAS, in mythology. See MINERVA, vol. xv.

PALLAS, in astronomy, a small planet, discovered 28th March, 1802, by Dr. Olbers, at Bremen; and situated between Mars and Jupiter. It is so small, that it does not subtend an angle large enough to be measured by our best instruments. The light reflected by it is attended by more or less of a nebulousity, proceeding perhaps from a copious atmosphere, and extending 468 miles from the body of the planet. It is remarkable for the eccentricity of its orbit, and its inclination to the ecliptic, which far exceed that of all the other bodies in the system.

From Dr. Herschel's observations (*Phil. Transf.* for 1802) we may conclude, that the apparent diameter of Pallas is either $0''.17$ or $0''.13$: its mean distance from the Sun 2.8; its distance from the Earth, at the time of observation, 1.8333; and its apparent diameter, at the mean distance of the Earth from the Sun, subtends an angle of $0''.3199$; so that its real diameter, if the largest measure be taken, will be 147 miles; and if the smallest, resulting from a more distinct observation, be taken, the angle under which it would be seen from the Sun will be only $0''.2399$, and its diameter no more than $110\frac{1}{2}$ miles. The elements of the orbit of Pallas, as others have stated them, are as follow:

Tropical revolution	-	-	-	47	7 ^m	11 ^d
Sidereal revolution, from Maskelyne's Table, 1703 ^d	-	-	-	16 ⁿ	48'	
Annual motion	-	-	-	2°	18'	11"
Mean longitude, Jan. 1, 1804	-	-	-	9°	29	52 58
Place of ascending node in 1804	-	-	-	5	22	28 0
Eccentricity, the mean distance being 1	-	-	-	0.24630		
Mean distance from the Sun, that of the Earth being 1	-	-	-	2.7910		
Mean distance in English miles	-	-	-	266,000,000		
Diameter in English miles, according to Herschel	-	-	-	80		
Ditto, according to Schroeter	-	-	-	2099		

For farther particulars, as to this and the three other newly-discovered small planets, see the article PLANET.

PALLAS, in the Roman history, a freedman of Claudius, celebrated for the power and the riches which he obtained. He advised the emperor his master to marry Agrippina, and to adopt her son Nero for his successor. It was through him and Agrippina, that the death of Claudius was hastened, and that Nero was raised to the throne. Nero, however, forgot to whom he was indebted for it. He discarded Pallas; and some time after caused him to be put to death, that he might procure his great riches.

PALLAS (Peter-Simon, M.D.), an eminent naturalist and traveller, was the son of Simon Pallas, a Prussian military surgeon, professor of surgery at Berlin, and chief surgeon of the hospital in that city. Simon Pallas, the father, signalized himself by a treatise on chirurgical operations, published in 1763, to which, in 1770, he added a supplement on the diseases of the bowels; and in that year he died, at the age of 76.

Peter-Simon Pallas, the celebrated naturalist who forms the subject of this article, was born at Berlin on the 22d of September, 1741. He received the early part of his education at home from private tutors, under whom the progress he made in his studies was truly amazing. Being destined to physic, so early as the fifteenth year of his age he entered upon a course of lectures on anatomy, physiology, botany, medicine, and surgery, under the professors Meckel, Sprægel, Gleditsch, Rolof, and his father; and applied himself with great assiduity to anatomical dissections. He was so apt a scholar in these several branches

VOL. XVIII. No. 1242.

of science, that, in the beginning of 1758, we find him, according to the account he gave of himself to Mr. Coxe, enabled to read a course of public lectures on anatomy. Yet, although he was thus occupied in his professional labours, he still found leisure to prosecute the study of insects and other classes of zoology, for which he seems very early to have conceived a predilection, and in which he particularly and eminently excelled.

In the autumn of the same year, young Pallas repaired to the university of Halle; where he attended the lectures of the celebrated Segner on mathematics and physics, and improved his acquaintance with mineralogy in the environs of that city. In the spring of 1759 he removed to Gottingen; and, though prevented by a long and dangerous illness from prosecuting his studies with his usual ardour, yet he made numerous experiments on poisons and their antidotes, applied himself to the dissection of animals, and made repeated observations on the worms which breed in the intestines. On this last subject he composed a very ingenious treatise, under the title of "*De Insestis viventibus intra Vientia*."

In July 1760 he was attracted to the university of Leyden by the fame of the celebrated physicians and naturalists Albinus, Gaubius, and Muschenbrœck; and by them he was noticed as a young man of a promising genius and indefatigable application. His talents particularly recommended him to the favour of Gaubius, principal professor and doctor of physic in that university. In December he took his doctor's degree, and distinguished himself by an inaugural dissertation, in which he defended by new experiments the above-mentioned dissertation composed at Gottingen. During his stay at Leyden, his taste for natural history became his predominant passion; he employed all the time he could steal from his professional studies in visiting the public and private cabinets of natural history with which Leyden abounded, and was particularly charmed with the collection of Gronovius, which he repeatedly examined.

Having visited the principal cities of Holland, he directed his course to London, where he arrived in July 1761. The principal intention of his journey to England was to improve his knowledge in medicine and surgery, and to inspect the hospitals. He was now, however, so much absorbed in his passion for natural history, that he neglected every other pursuit, and gave himself totally up to this favourite branch of science. At this juncture, his zeal was so ardent, that, after having passed the day in curiously examining the various collections of natural history, and perusing the principal books he could procure on that subject, he would frequently employ the greater part of the night, and occasionally even whole nights together, whenever he met with new publications that either awakened his curiosity or interested his researches. With a view of extending his information in this department, he took several journeys to the sea-coasts, and particularly in Sussex.

Being at length summoned by his father to return to Berlin, he quitted London with regret, in the latter end of April 1762, and repaired to Harwich, in order to embark for Holland. Being there fortunately detained some days by contrary winds, he embraced that opportunity of examining the sea-coast, and collecting a variety of marine productions. On the 13th of May he landed in Holland; and, passing through the Hague, Leyden, and Amsterdam, he continued his route through the circle of Westphalia, and arrived at Berlin on the 12th of June. Previously to his commencing the practice of his profession, his father sent him to Hanover, for the purpose of procuring the post of surgeon in the allied army; but as, upon his arrival in that city, in the month of July, peace was on the point of being concluded, he returned, by Wolfenbüttele, Brunswick, and Helmstadt, to Berlin. There he passed a year, which he chiefly employed in preparing materials for a "*Fauna Insectorum Marchica*," or a description of the insects in the march of Branden-

burg. Animated by his predilection for natural history, and encouraged by the favour and patronage of Gaubius, he at length prevailed upon his father to let him go and settle in Holland. Thither accordingly he went, and resided at the Hague.

His reputation as a man of science was by this time so well established, that he was, the same year, elected fellow of the Royal Society of London; and in the following year member of the Academie des Curieux de la Nature; to both of which societies he had previously sent very interesting and ingenious papers. The intimacy he now contracted with the most celebrated naturalists in Holland, and particularly with those of the Hague, who had just begun to form a literary society; the free access which he had to the museum of the prince of Orange, and other curious cabinets; the systematic catalogues of those collections that he drew up, and several of which he gave to the public; contributed to advance his knowledge of the productions of nature in the various parts of the globe, and to collect such materials as gave birth to those accurate compositions on zoology, which have deservedly distinguished him as the first zoologist of Europe. One of his earliest works in this branch of science, which rendered him eminently conspicuous, was his "Elenchus Zoophytorum." In this work, after having treated on the nature of these ambiguous kinds of animals in a general method, and stated the various opinions of authors relating to the place they ought to hold in the system of nature, he describes from his own inspection more than 270 species of those worms and animalcules, known under the several generic appellations of polypes, corals, madrepores, corallines, sea-pens, *tania* or tape-worms, sponges, sea-fans, &c. The free access which he had to the museum of the prince of Orange, and other curious collections in Holland, enabled him to enrich his work with the description of a great variety of these productions, brought from both the Indies. He has described each species at large, and given it a new name, characteristic of its real discrepancies; and, what especially increases the merit of his work, he has, with wonderful industry, extricated, as far as possible, the synonyms of former authors, both ancient and modern; thus rendering his book highly useful to such as are inquisitive in this branch of natural history.

In a dedication prefixed to his "Miscellanea Zoologica," published in the same year, the author lays before the prince of Orange a plan for a voyage to the Cape of Good Hope, and to the other Dutch settlements in the East Indies, and which, impelled by his wonted ardour for scientific knowledge, he offered to undertake and superintend. This project was strongly recommended by Gaubius, and approved by the prince; but was prevented from being carried into execution by the author's father; who not only refused his consent to his taking such a distant expedition, but even recalled him to Berlin: in obedience to his father's wishes, but with great reluctance, he quitted Holland in November 1766.

On his return to Berlin (continues Mr. Coxe, from whose ingenious Travels these particulars are extracted), his only consolation in being separated from his friends in Holland, and in having lost so many opportunities of improving himself in natural history, consisted in putting into order the numerous materials he had collected, and the observations he was incessantly making, and in giving them to the public. He had however scarcely begun to publish his "Spicilegia Zoologica," before he was invited by the empress Catharine II. to accept of the professorship of natural history in the Imperial Academy of Sciences at St. Petersburg. Although in this instance his father and relations again refused their assent, yet the author's ardent zeal for his favourite science, joined to an irresistible desire to visit regions so little explored, induced him, without a moment's hesitation, to accede to the invitation, and to hasten his departure for a country where his curiosity was so likely to be amply gratified.

He accordingly quitted Berlin in June 1767, and arrived at Petersburg on the 10th of August.

He made his appearance among the Russians at a critical period. The empress had already ordered the Academy of Sciences to send astronomers into various parts of the Russian empire, to observe the transit of Venus over the sun's disk in 1769. Being just returned from a voyage down the Volga, and from visiting the interior provinces of European Russia, the enlightened sovereign had perceived the deficiencies of the topographical and geographical accounts, and anticipated the advantage of deputed learned and skilful men to visit the distant provinces of her extensive dominions; with a view to enlarge the bounds of science, and extend the knowledge of useful arts among the natives. For this purpose, Catharine had directed the academy to send, in company with the astronomers, the most able naturalists and philosophers. Pallas instantly offered to accompany this expedition; and was as eagerly accepted. He was immediately charged with drawing out general instructions for the naturalists, and was gratified with the choice of his associates. To him was submitted, at his own request, the conduct of the expedition to the east of the Volga, and towards the extreme parts of Siberia; and he was the most calculated for that expedition, as the elder Gmelin, who had been his precursor in those regions, had almost entirely neglected the zoology of those remote districts. Pallas employed the winter previous to his departure in forming a systematic catalogue of the animals in the cabinet of the Academy of Sciences; in putting into order the celebrated collection of professor Breyn of Dantzic, lately purchased by prince Orlov; in preparing for the press six numbers of his "Spicilegia Zoologica," which were printed during his absence, under the direction of Dr. Martin; and in forming the necessary arrangements and notices for his intended expedition.

At length, in June 1768, he quitted Petersburg, in company with Messrs. Falk, Lepechin, and Guldenstadt, as his associates; passed through Moscow, Vladimir, Kasimof, Murom, Arsamas, to Kasan; and, having examined great part of that province, wintered at Simbirsk. From thence he departed, in March of the following year, and penetrated through Samara and Orenburg, as far as Gurief, a small Russian fortress situated at the mouth of the river Yaik or Ural. There he examined the confines of Kalmuc Tartary, and the neighbouring shores of the Caspian; and, returning through the province of Orenburg, passed the second winter at Ufa. After several expeditions in the adjacent parts of that province, he left Ufa on the 16th of May, 1770; prosecuted his route through the Uralian mountains to Catharinenburgh; visited the mines of that district; proceeded to Tcheliabinsk, a small fortress in the government of Orenburg; and in December made an excursion as far as Tobolsk. The next year he was employed in traversing the Altaic mountains, and in tracing the course of the Irtysh up to Omk and Kolyvan; where, having inspected the celebrated silver-mines, he made for Tomsk, and finished that year's expedition at Krasnoyarsk, a town upon the Yenisei. In that place, situated only in 56° north latitude, the cold was so intense, that the learned professor was witness to the natural freezing of quicksilver, which curious phenomenon he has minutely described. From Krasnoyarsk he issued on the 7th of March, 1772; and proceeded by Irkutsk, and across the lake Baikal, to Udinsk, Selenginsk, and Kiakta, where the trade between Russia and China is principally carried on. Having penetrated into that part of Dauria which is situated in the south-easternmost part of Siberia, he journeyed between the rivers Ingoda and Argoon, at no great distance from the Amoor; thence, tracing the lines which separate the Russian empire from the Mongul hordes dependent upon China, he returned to Selenginsk, and again wintered at Krasnoyarsk. In the summer of 1773 he visited Tara, Yaitsk, and Astracan, and concluded his route for

for that year at Tzaritzin, a town upon the Volga: from whence he continued his journey in the ensuing spring; and arrived at Petersburg on the 30th of July, 1774, after an absence of six years.

The account of this extensive and interesting tour was published by Dr. Pallas in five volumes 4to. which greatly extended his fame and established his character. The author, in this valuable work, has entered into a geographical and topographical description of the provinces, towns, and villages, which he visited, accompanied with an accurate detail of their antiquities, history, productions, and commerce. He has discriminated many of the tribes who wander over the various districts, and near the confines of Siberia; and specified with peculiar precision their customs, manners, and languages; he has also rendered his travels invaluable to the naturalist, by the many important discoveries in the animal, vegetable, and mineral, kingdoms, with which he has enriched the science of natural history. Two years afterwards, in 1776, the professor published his collections relative to the political, physical, and civil, history of the Mongul tribes; in which he throws new light on the annals of a people whose ancestors conquered Russia, China, Persia, and Hindoostan; and at more than one period established perhaps a larger empire than ever was possessed by any single nation. Pallas here proves unquestionably that the Mongul tribes are a distinct race from the Tartars; that they differ from them in their features, language, and government; and resemble them in nothing except in a similar propensity to a roving life. He intended a second volume, describing their religious establishment, consisting in their worship of the Dalai Lama; which is the religion of Thibet, and of the Mandshoo sovereigns who now sit upon the throne of China; "a work," as Mr. Tooke justly observes, "that will enrich the stock of human knowledge with discoveries, the greatest part entirely new, and which no person but Pallas is able to communicate." Whether however this second volume ever made its appearance, we have our doubts.

In the same year in which Dr. Pallas printed his "Elenchus Zoophytorum," he also published a treatise under the title of "Miscellanea Zoologica, quibus novæ imprimis atque obscuræ animalium species describuntur, et observationibus iconibusque illustrantur." This work is in a great measure incorporated into a subsequent publication made the next year on his return to Berlin, intitled "Spicilegium Zoologicum," and was continued in numbers, or *fasciculi*, till 1780. The works of count Buffon, the illustrious French zoologist, amply attest the labours of Pallas; and our countryman, Mr. Pennant, makes frequent acknowledgments of his obligations to the same source, particularly for his History of Quadrupeds and Arctic Zoology. In June 1777, the learned professor read before the Academy of Petersburg, in a meeting at which the king of Sweden was present, a dissertation on the formation of mountains, and the changes which this globe has undergone, more particularly as it appears in the Russian empire. This treatise appeared so curious to Mr. Tooke, who was also, as a member of the academy, present at that sitting, that he has given a translation of it in his *Russia Illustrata*. In 1778 the doctor published "Novæ Species Quadrupedum e Glirium Ordine," describing numbers of the rat genus and their anatomy. In 1781 he brought out "Enumeratio Plantarum quæ in Horto Procopii à Demidof Moscuâ vigent;" or, Catalogue of the Plants in M. Demidof's Gardens at Moscow. His new northern collections on various subjects in geography, natural history, and agriculture, came forth the same year, to which were afterwards added two more volumes. In 1782 he put forth two fasciculi or numbers of "Icones Insectorum præsertim Russiæ Siberiæque peculiarium." In 1784 he published the first number of his "Flora Rossica;" a splendid work, executed at the empress Catharine's expense. About this period her majesty con-

ceived the idea of collecting from all quarters of the globe a universal vocabulary, the superintendence whereof she committed to our author, which necessarily for a time retarded his zoological researches. Exclusive of these separate publications, he printed, in the Acts of the Imperial Academy of Sciences, various zoological and botanical dissertations. Not long after this, he was distinguished by a peculiar mark of imperial favour, in being appointed member of the board of mines, with an additional salary of 200l. per annum, and honoured with the order of St. Vladimir. The empress also purchased his ample collection of natural history, in a manner highly flattering to the author, and honourable to herself. Being informed that he was desirous to dispose of that collection, her majesty sent to let him know that her country should not be deprived of so exquisite a cabinet; that she would be the purchaser; and ordered him to make out the catalogue, and fix the price. He accordingly named 15,000 rubles. Having examined the catalogue, she subjoined with her own hand: "Dr. Pallas understands natural history much better than figures: he ought to have charged 20,000 instead of 15,000 rubles for so many valuable articles. The empress, however, takes upon herself to correct the mistake; and hereby orders her treasurer to pay 20,000 rubles. At the same time Dr. Pallas shall not be deprived of his collection, which shall still continue to be in his own possession during his life, as he so well understands how to render it most useful to mankind."

In 1784 the care of putting in order and publishing the papers of Gmelin and professor Guldenstædt was assigned to Dr. Pallas, which he executed with great diligence and accuracy, though, from some incidental cause to us unknown, only the first volume of Guldenstædt's remains, containing his journal and the description of the districts of mount Caucasus, ever came to the public eye. In 1794 Dr. Pallas travelled to the Crimea; and, on his return, published an account of that delightful peninsula, under the title of "Physical and Topographical Picture of Taurida." On his return, finding that the state of his health required residing in a warm climate, he laid before the empress a representation to that effect, who not only gave him permission to make choice of a settlement in any part of her dominions, but, on his preference of Taurida, presented him with an estate in that country, and a sum of money (10,000 rubles) to form his establishment. Here it was that he was visited by Dr. Clarke, on his travels in the year 1800; with whose account of his then situation we shall conclude this article. "Akmatshet," says that spirited and ingenious traveller, "will long be celebrated as the residence of professor Pallas, so well known to the literary world. His fame would have been sufficiently established, if he had published no other work than that begun by him under such favourable auspices, the *Flora Rossica*; yet the barbarity of the people with whom he is compelled to live, [how was he compelled?] is such, that they will not allow him to complete the undertaking. The drawings were all finished, and almost all the text. To the hospitable and humane attentions of this excellent man we were indebted for comforts, equal, if not superior, to those of our own country, and for every literary communication it was in his power to supply. When we delivered our letters of recommendation to him, he received us rather as a parent than as a stranger to whose protection we had been consigned. We refused to intrude by occupying apartments in his house: this had more the appearance of a palace than the residence of a private gentleman; but one day, when we were absent upon an excursion, he caused all our things to be moved, and upon our return we found a suite of rooms prepared for our reception, with every convenience for study and repose. I consider myself indebted to him even for my life. The fatigue of travelling, added to the effect of bad air and unwholesome food, rendered a quartan fever so habitual to me, that, had it not been for his care and skill, I should not have lived

lived to make this grateful acknowledgment. He prescribed for me; administered every medicine with his own hands; carefully guarded my diet; and, after nursing me as his own son, at last restored me to health. When I recovered, he ransacked his museum for drawings, charts, maps, books, antiquities, minerals, and whatever else might gratify our curiosity or promote the object of our travels; he accompanied us upon the most wearisome excursions, in search not only of the insects and plants of the country, but also of every document likely to illustrate either its ancient or its modern history. His decline of life has been embittered by a variety of afflictions, which he has borne even with stoical philosophy. Splendid as his residence appeared, the air of the place was so bad, that the most rigid abstinence from all sorts of animal food was insufficient to preserve his family from fevers. Yet we left him, determined to pass the remnant of his days in cultivating vineyards among the rocks upon the south coast of the peninsula. We used every endeavour to prevail upon him to quit the country, and accompany us to England; but the advanced period of his life, added to the certainty of losing all his property in Russia, prevented his acquiescence. Our entreaties were to no effect; and perhaps, before this meets the public eye, our friend and benefactor will be no more." Happily, however, Dr. Pallas survived the departure of our traveller upwards of ten years; when, determining once more to see his brother and his native city, he took a journey to Berlin, where he died, September the 8th, 1811, in the seventy-first year of his age.

Pallas sold his Herbarium to Dr. Clarke, who brought it to London, and sold it by auction in May 1808. This valuable collection was purchased by Aylmer Burke Lambert, esq. a vice-president of the Linnæan Society, in whose Transactions, vol. x. he has given the following account of it. "It contains some thousands of specimens in very fine preservation, especially those which belong to the Russian empire, collected in his various journeys undertaken to investigate and publish the natural history of that extensive country. The plants are the best prepared of any I have ever seen, except a collection a few years ago from Cayenne, taken from the French, (who excel so much in their manner of preparing their collections of natural history in the countries they explore; and who have of late years brought home so many valuable ones from New Holland, and from countries within the tropics.) It also contains many hundreds of specimens given to Pallas by various celebrated botanists. George Forster, who accompanied his father with captain Cook in his second voyage round the world, and who afterwards was engaged by the empress Catharine to join in a similar expedition, which never took effect, sent to Pallas fine specimens of all the plants gathered during his voyage with Cook. All the plants collected in Billings's expedition, by Dr. Merke, the naturalist employed in that voyage, and others, appear to be here. Sir Joseph Banks sent Pallas a fine collection of specimens, which were collected by him and Dr. Solander in their celebrated voyage with captain Cook. There are also a great number of species from Professor Thunberg, and Grecian plants from the late much-lamented Dr. Sibthorp. Among these is the true hellebore of the ancients, found by him on mount Olympus, the *Helleborus officinalis* of Dr. Smith's Prodromus Floræ Græcæ. The greater part of the plants found by Sievers in his journey to discover the true rhubarb, and by him communicated to Pallas, are in this collection. I find also many plants of the Flora Aultriacæ from Jacquin, and several of Forkahl's, communicated by Vahl. Cavanilles appears to have sent to Pallas many plants from Spain. Here is also a curious collection from Persia, made chiefly in the neighbourhood of Gilan by Gmelin. There are many specimens of Russian plants from Gmelin, Georgi, and others, all named and numbered according to their works, and having synonyms of the older authors

prefixed: also from Steller, with names and numbers from his unpublished Flora Ochotensis, and other MS. works mentioned by Pallas in the preface to his Flora Rossica.

"Pallas's plants of his own collecting are very rich in duplicates; of some there are as many as fifteen or twenty, in every state he could find them both in flower and fruit; and, whenever he discovered the same species altered by soil or situation, he seems never to have neglected preserving it. Every specimen is named in his own handwriting, and the habitats noted, sometimes with observations; as for instance, with respect to his *Phlomis herba-venti*, of which Willdenow makes a new species, *Ph. pungens*, he observes, that a decoction of (this plant is used by the Russians as one of the best means of hardening steel. In this Herbarium I find the greatest part of the plants figured in the Flora Sibirica of Gmelin; several very good specimens of that fine plant *Campanula punctata*; and those figured in Amman's Stirp. Rarior. with *Cypripedium guttatum*, which our president informed me he had never been able to find in any other collection. The plants of Flora Rossica, and those of Pallas's Travels; all his Astragali and Salsolæ, and all the plants collected in his last tour in the Crimea, are here; besides a great number of new species not noticed in any of the above-mentioned works, and which, no doubt, he intended to have published, in continuation of that splendid work the Flora Rossica, of which plates have been already engraved sufficient, as I understand from Dr. Clarke, to make another volume; and which, I hope, will soon make its appearance, as it only waits for some bookfeller to undertake it." The preceding account is accompanied with descriptions and engravings of some of the most remarkable and curious species in this valuable herbarium; concluding with a hope "that, in future, every botanist sent on similar expeditions, may execute his charge with as much assiduity as Pallas has done, and bring us home as extensive collections." Linn. Trans. 1811. Clarke's Travels. Tooke's View of the Russian Empire.

PALLASTA, *f.* [designed to commemorate the very eminent scientific merit of the subject of the preceding article. The original Pallasia, published by the younger Linnæus, in his Supplementum, p. 37. was what Pallas himself, in the 2d vol. of his Travels, had named *Pterococcus*. He subsequently referred it to *Calligonum*, to which it unquestionably belongs; and l'Heritier, having adopted the same measure, chose a new Pallasia in the *Encelia* of Adanson.] In botany, a genus of the class syngenesia, order polygamia-frustranea, natural order compositæ, *Linn.* (corymbifera, *Juss.*) Generic characters.—Common calyx of numerous, oblong, imbricated, nearly-equal, scales. Corolla: compound, radiated; florets of the disk numerous, tubular, five-cleft, all perfect; those of the radius ligulate, spreading, oblong, somewhat wedge-shaped, with three or four obtuse terminal teeth. Stamina: in the florets of the disk only, filaments five, capillary very short; antheræ united into a cylindrical tube with five teeth. Pistillum: in the florets of the disk, germen obovate, compressed, fringed; style thread-shaped, the length of the stamens; stigmas two, spreading; in those of the radius, germen obsolete or abortive, smooth; style and stigmas imperfect or wanting. Pericarpium: none, except the permanent calyx. Seeds in the florets of the disk solitary, obovate, compressed, notched at the top, bordered and fringed at the margin; those of the radius obsolete and smooth. Down none. Receptacle: slightly convex, chaffy; its scales lanceolate, keeled, acute, nearly as long as the florets of the disk.—*Essential Character.* Receptacle chaffy; down none; seeds compressed, bordered and fringed; calyx of numerous, imbricated, nearly-equal, scales.

1. *Pallasia halimifolia*, or downy pallasia: leaves blunt, nearly entire, downy on both sides; radiant florets deeply and unequally four-toothed, scarcely twice as long as those

those of the disk. Native of Mexico. It is with us in Europe a stove-plant, flowering from July to September, but not much cultivated. The stem is shrubby, branched, and downy, about two feet high; branches alternate, leafy. Leaves alternate, on downy stalks about an inch long, broadly ovate, obtuse, one and a half or two inches long, entire, occasionally rather wavy or obscurely toothed here and there, three-ribbed, of a pale glaucous green, densely clothed on both sides with dense, soft, fine, short down. Stipules none, but a dense snow-white tuft of accumulated down is more or less remarkable at the insertion of each footstalk. Panicles terminal, corymbose, downy, rather leafy, of about four or five flowers, scarcely so large as a French marigold (*Tagetes patula*), with a yellow radius whose florets are broad, short, unequally lobed, and a convex greenish disk.

2. *Pallasia grandiflora*, or smooth pallasia: leaves bluntish, nearly entire, glaucous, smooth; radiant florets, slightly three-toothed, thrice as long as those of the disk. Native of New Spain. It flowered at Madrid in September. This has the habit of the foregoing; but the leaves are smooth, and the flowers larger, in consequence of the florets of the radius being much longer; their colour is pale-yellow; their apex obtuse, with only three very shallow teeth, instead of being deeply and irregularly lobed; the florets of the disk are of a reddish-white below, their limb dark-brown. Such is the description in Cavanilles.

3. *Pallasia ferratifolia*, or ferrated pallasia; the *Ximenesia encelioides* of Cavanilles: leaves pointed, ferrated, hoary beneath; with winged ferrated footstalks; radiant florets, three-toothed. Native of Mexico, from whence the seeds were sent to the royal garden at Madrid. The plant flowered there in November. We have not heard of it in England, but are indebted to Cavanilles for a specimen: he made it a distinct genus. Root perennial. Stem three feet high, branched, leafy, downy, ribbed, pale, apparently somewhat shrubby, corymbose, and many-flowered. Leaves mostly alternate, not opposite, except perhaps some of the lowermost, ovate, pointed, three-ribbed, with many lateral veins, strongly and sharply ferrated; their upper side bright-green, besprinkled with small depressed bristles; under densely-downy, pale, or glaucous. Footstalks about a quarter the length of the leaves, bordered with a narrow wing, which is greatly dilated and toothed at the base, where it clasps the stem or branch. Flowers terminating each branch, solitary, larger than the last, their radiant florets spreading, bright-yellow, each near an inch long; disk brownish. Cavanilles named this supposed genus after Joseph Ximenes, an apothecary, who undertook a *Flora of Castulo*, in four volumes, in which he delineated more than 700 plants, besides native butterflies and birds of the same neighbourhood. Whatever his merits might be, the generic appellation given by Cavanilles could scarcely be retained, as the Linnæan system already contains a *Ximenia*, long ago consecrated to one of his countrymen of the same name, by Plumier. See that article; see also *CALLIGONIUM*, *COREOPSIS*, and *CRYSIS*.

PALLAVICINO (Sforza), a cardinal, born at Rome in 1607, was the eldest son of a marquis of that name in Lombardy. He gave early proofs of quick parts, particularly by supporting for three successive days a solemn disputation on the whole body of scholastic theology. This study naturally gave him a propensity to the ecclesiastical profession, which he adopted, notwithstanding the opposition of his parents. His piety and regularity, together with his advantages of birth and connexions, caused him to be admitted early into the prelacy, and to be successively appointed to the governments of Jesi, Orvieto, and Camerino. The brilliant prospects which were opened to him did not, however, prevent his putting into execution a design of retiring from the world; and in his thirtieth year he commenced a noviciate in the society of Jesuits at Rome. When it was finished, he was employed for several years in giving lectures in philosophy and theology, and in presiding over the studies of

the Roman college. He was also qualificador of the holy office, and an examiner of candidates for the episcopacy, and was consulted by the popes in affairs of moment. The service he rendered the Roman church by composing a History of the Council of Trent, in opposition to that of Paul Sarpi, was rewarded by pope Alexander VII. with his nomination to the cardinalate in 1657, though it was not declared till two years afterwards. He continued after his elevation to live in the cloister, occupied in his studies, and in the concerns of the church, and affording an example of christian virtue and piety, till his death, in 1667. The "History of the Council of Trent," by Pallavicino, was received with great applause by those of his own party, who considered it as a powerful antagonist to that of Fra. Paolo, as Sarpi was commonly called, which had raised such unfavourable impressions of the policy of the court of Rome. It is written in Italian; and was first printed at Rome, in two volumes folio, 1656, 1657. It was republished, in three volumes quarto, 1664, with various corrections and additions by the author. The style of this work is grave, elegant, and florid; but somewhat too much studied, and defective in simplicity. It is considered as of good authority for its facts, and it is allowed that in many instances he has been successful in pointing out the errors of Fra. Paolo; but the political maxims disclosed in it gave great offence to persons even of the same communion, and were commented upon by a French Jansenist, in a work entitled "*Les nouvelles Lumières Politiques pour le Gouvernement de l'Eglise, ou l'Evangile nouveau du Cardinal Pallavicino, révélé par lui dans son Histoire du Concile de Trente.*" A translation of the History into Latin, by father Giattini, was published at Antwerp in 1672; one into French, which had been completed, did not appear, because the History "was not in the French taste." The original work was abridged by father Puccinelli; and publications were made of maxims and characters extracted from it.

This cardinal was the author of other works, partly ascetical and moral, partly theological. He also, while a Jesuit professor, published a tragedy, entitled "*Ermenigildo*," which he republished, with a Preliminary Discourse, said to be more valuable than the tragedy itself, but in which he unsuccessfully contended for the use of rhymed verse in these compositions. To him likewise belongs a grammatical work entitled "*Avvertimenti Gramaticale*," published under the name of Fr. Raimondo, and esteemed for its precepts respecting good writing. His "*Letters*," in Italian, were published in 1669. *Tiraboschi*.

PALLAVICINO (Ferrante), an unfortunate man of letters, was born at Placentia about 1615. Although the eldest son of his family, he chose to devote himself to the ecclesiastical state, and became a canon-regular of Augustines of the congregation of Lateran. He distinguished himself by the vivacity of his parts, which gave him a turn to satire, and was little restrained by decency. This disposition was at length the cause of his ruin. During the war between pope Urban VIII. of the Barberini family, and Edward Farnese duke of Parma and Placentia, he supported the cause of his own sovereign with his pen, and wrote some bitter satires against the pontiff and all his house. Bent upon revenge, the papal court set a price upon his head, which caused him to withdraw to Venice, where he lived in security. A young Frenchman, son of a bookseller at Paris, being bribed by the pope's nuncio, obtained his confidence, and perfidiously advised him to come to France, and take up his abode at Orange, where he would be safe under a protestant prince. Pallavicino incautiously put himself under the conduct of this pretended friend, who led him over the bridge on the Sorgue into the county of Venaissin, belonging to the holy see. As soon as he saw the pope's arms over the gate, he cried "I am undone!" and was immediately arrested by officers who were waiting for him, who carried him to Avignon, where he was imprisoned.

prisoned. Fourteen months afterwards, in 1644, he was beheaded. The wretch who betrayed him was stabbed at Paris some years afterwards, by a friend of Pallavicino. This writer left several works, which have been fought by the curious, and are distinguished by their satirical severity. Among others, he wrote a collection of letters, which he called "The Courier robbed of his Mail;" which may have furnished a hint for that admirable modern publication, *The Two-penny Post-bag*. He also wrote a history of the public events in Italy in 1636. A selection of his works was published in two volumes 12mo. 1644, at Geneva, under the title of *Villa Franca*. He is also the reputed author of an Italian work entitled "The Celestial Divorce, or the Separation of Jesus Christ from his Spouse the Roman Church;" Amst. 1696. *Gen. Biog.*

PALLEIROS, a mountain of Arabia, in the province of Oman: eighty miles west-south-west of Mascat.

PAL'LENDORF, a town of Austria: two miles north of Zisterdorf.

PALLENE, a small peninsula of Macedonia, formerly called *Phlegra*, situate above the bay of Thermoë, on the Ægean Sea, and containing five cities, the principal of which is called Pallene. It was in this place, according to some of the ancients, that an engagement happened between the gods and the giants.—Also a village of Attica, where Minerva had a temple, and where the Pallantides chiefly resided.

PAL'LET, *f.* [*paillet*, in Chaucer; which was probably the French word, from *paille*, straw, and secondarily, a bed.] A small bed; a mean bed.—His secretary was laid in a *pallet* near him, for ventilation of his thoughts. *Wotton*.

Why rather, Sleep, liest thou in smoky cribs,
Upon uneasy *pallets* stretching thee,
And hush'd with buzzing night-flies to thy slumber;
Than in the perfum'd chambers of the great,
Under the canopies of costly state,
And lull'd with sounds of sweetest melody? *Shakespeare*.

[*Palette*, Fr.] A porrenger, formerly used by surgeons to receive blood in.—A surgeon drew from a patient in four days, twenty-seven *pallets*, every *pallet* containing three ounces. *Hakewill*.—In heraldry, a diminished pale, a little posť.

PALLETS, in clock and watch work, are those pieces or levers which are connected with the pendulum or balance, and receive the immediate impulse of the swing-wheel, or balance-wheel, so as to maintain the vibrations of the pendulum in clocks, and of the balance in watches. The pallets, in all the ordinary constructions of clocks and watches, are formed on the *verge*, or axis, of the pendulum or balance, and are of various lengths and shapes, according to the construction of the piece, or the fancy of the artist. For the modern improvements, comparative advantages, and the manner of constructing pallets, see the article *HOROLOGY*, vol. x.

PALLET, in ship-building, is a room within the hold, closely parted from it, in which, by laying some pigs of lead, &c. a ship may be sufficiently ballasted, without losing room in the hold; which, therefore, will serve for stowing more goods.

PALLETING, *f.* A slight platform made over the bottom of the magazine, to preserve the powder from damp.

PALLETO'QUE, *f.* [probably from the Lat. *pallium*.] A short kind of coat with sleeves, such as was formerly worn by pages. *Scott*.

PAL'LI, a town of Asiatic Turkey, in the province of Diarbekir: eighty-five miles north-east of Diarbek, and 150 south-south-west of Erzerum.

PALLIAMENT, *f.* [*pallium*, Lat.] A dress; a robe.—A *palliament* of white and spotless hue. *Shakespeare*.

PALLIA'NO, or **PALIA'NO**, a town of Italy, in Campagna di Roma: twenty-eight miles east of Rome.

PAL'LIARD, *f.* [from *paille*, *paillasse*, Fr. straw.] An old word for one whose father was born a beggar. *Cole*.—A whoremaster; a lecher:

Thieves, pandars, *palliards*, sins of every sort;
These are the manufactures we export. *Dryden*.

PALLIARDISE, *f.* [French.] Fornication; whoring. *Obsolete*.—Nor can they tax him with *palliardise*, luxury, epicurism. *Sir G. Buck's History of Richard III*.

PALLIAT'Æ, *f.* A name which the Romans gave to such plays as laid the plot in Greece, and required the performers to appear in Grecian habits. It is used in contradistinction to *togata*, in which the scene was laid at Rome, and in which the dresses were Roman. The word *palliatis* is derived from *pallium*, which was a part of dress peculiar to the Greeks; whereas the toga belonged to the Romans only.

To PALLIATE, *v. a.* [*pallio*, Lat. from *pallium*, a cloak; *pallier*, Fr.] To clothe; to cover.—They wallow in all kind of turpitude, yet nowhere persecuted; being *palliated* with a pilgrim's coat and hypocritic sanctity. *Herbert's Travels*.—To cover with excuse.—They never hide or *palliate* their vices, but expose them freely to view. *Swift*.—To extenuate; to soften by favourable representations.—The fault is to extenuate, *palliate*, and indulge. *Dryden*.—To cure imperfectly or temporarily, not radically; to ease, not cure.

PALLIATE, *adj.* Eased, not perfectly cured.—The nation was under its great crisis and most hopeful method of cure, which yet, if *palliate* and imperfect, would only make way to more fatal sickness. *Fell's Life of Hammond*.

PALLIATION, *f.* [*palliation*, Fr. from *palliate*.] Extenuation; alleviation; favourable representation.—I saw clearly through all the pious disguises and soft *palliatio*ns of some men. *King Charles*.—Such bitter invectives against other men's faults, and indulgence or *palliation* of their own, shews their zeal lies in their spleen. *Gov. of the Tongue*.—Imperfect or temporary, not radical, cure; mitigation, not cure.—If the just cure of a disease be full of peril, let the physician resort to *palliation*. *Bacon's Nat. History*.

PALLIATIVE, *adj.* [*palliatif*, Fr. from *palliate*.] Extenuating; favourably representative.—He openly defends his new attempt, not in a *palliative* apology, but in a peremptory declaration. *Warton's Rowley Enq.*—Mitigating, not removing; temporarily or partially, not radically, curative.—Consumption pulmonary seldom admits of other than a *palliative* cure, and is generally incurable when hereditary. *Arbuthnot*.

PALLIATIVE, *f.* Something mitigating; something alleviating.—It were more safe to trust to the general aversion of our people against this coin, than apply those *palliatives* which weak, perfidious, or abject, politicians administer. *Swift*.

PALLICO'DE, a town of Hindoostan, in Mysore, situated at the extremity of a pass leading to the Barmaul country, called indifferently the Pass of Pallicode, and the Pass of Oodeadurgum. Through this pass the Mysore armies were generally sent to invade the Carnatic. It is eleven miles north-west of Dairempoury.

PAL'LID, *adj.* [*pallidus*, Lat.] Pale; not high-coloured; not bright: *pallid* is seldom used of the face.—Its *pallid* bloom sick-smelling henbane shew'd. *Harte*.

Of every fort which in that meadow grew
They gather'd some; the violet *pallid* blue. *Spenser*.

PALLIDITY, *f.* Paleness.—The agitation of the soul throws the animal spirits into a confused and impetuous motion, which imparts such a flush or *pallidity* to the face, so enlarges or contracts the lineaments and features, whereby it is easily perceivable that something more than ordinary is the matter. *Philos. Lett. on Physiognomy*, 1751.

PAL'LIDLY, *adv.* Palely; wanly.—They sometimes appear *pallidly* sad, as if they were going to their graves. *Bp. Taylor's Artif. Handsom.*

PAL'LIDNESS,

PAL/LIDNESS, *f.* *Palenefs*.—Let no man be discouraged with the *pallidness* of piety at first, nor captivated with the seeming freshness of terrene pleasures; both will change; and, though we may be deceived in both, we shall be sure to be cheated but in one. *Feltham's Ref.* ii. 66.

PAL/LIER, *f.* [French.] In carpentry, a landing-place in a staircase, a step broader than the rest, which serves for a kind of resting-place.

PALLIFICATION, *f.* See **PALIFICATION**.

PALLIGORAM, a town of Hindoostan, in Golconda: twenty-five miles south-east of Hydrabad.

PALLIOW, a town of Hindoostan, in Bahar: forty-five miles south-west of Patna.

PALLIOT (Peter), an industrious genealogist, was born at Paris in 1608. He settled at Dijon, where he married the daughter of a printer, and followed the same profession. From an early age he had attached himself to the studies of genealogy and heraldry, which he continued to pursue with great assiduity, publishing various works upon those subjects. Of these the most valued are, 1. *Le Parlement de Bourgogne*, 1649, folio; to which another volume was added by Fr. Petitot, in 1733. 2. *Science des Armoiries de Gelliot, augmentée de plus de 6000 Ecussons*; Paris, 1660, folio. His other works are genealogical histories of particular families; and he left in manuscript thirteen volumes, folio, of memoirs concerning the families of Burgundy. Palliot not only printed his own works, but engraved with his own hand all the very numerous heraldic plates by which they were illustrated. He died at Dijon in 1698, at the age of eighty-nine. *Moreti*.

PALLISA'DE. See **PALISADE**.

PAL/LISER (Sir Hugh, Bart.), a distinguished naval officer, was born at Kirk Deighton, in the county of York, (and not in Ireland, as has been erroneously stated.) He early distinguished himself in the service; and in 1748, on-board the *Captain*, in a desperate action in the Mediterranean, with a frigate of superior force, received a shot in his leg, and two balls in his body, by the explosion of an arm-chest, which also killed two persons on the quarter-deck. This wound, baffling all the skill of the faculty, subjected him ever after to ceaseless torture. His uncle was a colonel, and wounded under lord Galway; and his father (a captain in the army), although shot through both cheeks in the disastrous battle of Almanza, yet survived many years.

Sir Hugh, notwithstanding this wound, proceeded in the high career of nautical fame till the lamentable 27th of July, 1778, when admiral Keppel and vice-admiral Palliser preferred counter-charges of accusation against each other, for their conduct on that day: the intrepidity of the latter, on this occasion, was allowed even by his enemies; but the merits were soon converted into a question of party violence, in which the professional reputation of those officers (though both were acquitted) was indiscriminately wrecked! See the article **ENGLAND**, vol. vi. p. 748, 9.

Soon after this, his majesty, on the death of admiral sir Charles Hardy, appointed sir Hugh to the government of Greenwich Hospital; when, resigning his seat in parliament, he retired from all public concerns, except the duties of his government, which were always ably and unremittingly discharged.

Sir Hugh was a man of undaunted courage, and possessed a great share of nautical knowledge; and the wise and salutary laws which he caused to be enacted for the benefit of his country, and the comfort and happiness of the poor fishermen in Newfoundland, during his government of that province, were proofs of a sound mind, and a humane and benevolent disposition. He entered into the service very early in life. He was made a captain in 1746, and in 1762 governor of Newfoundland; in 1765 he concluded a peace with the Indians, upon the back settlements of Canada; in 1770 he was made a rear-admiral, and in the same year one of the Elder Brethren of the

Trinity; in 1771 he was appointed a Comptroller of the Navy; in 1773 created a Baronet, and in 1775 he was chosen M.P. for Scarborough; in 1776 he was made one of the Lords of the Admiralty, and in 1778 a Vice-Admiral, Lieutenant-General of Marines, and Governor of Scarborough Castle; in 1780 he was appointed Master and Governor of Greenwich Hospital; in 1781 he was chosen to represent the borough of Huntingdon in parliament; and 1787 he attained the rank of Admiral of the White. For the last fifteen or sixteen years of his life he seldom lay down on a bed: from the constant pain in his leg, he was under the necessity of composing himself in an easy chair, sleeping at intervals; and, when awake, he placed the wounded limb on the contrary knee, in which position he employed himself in rubbing the bone (for it was literally no more), to allay the pain, till sleep again insensibly overtook him. The immediate cause of his death was occasioned by a dropsical habit of body, to which he had always been subject; and, after a severe illness of five months, he died at his feat called Vache, in Buckinghamshire, on the 19th of March, 1796, in the 75th year of his age. *Genl. Mag.* vol. lxvi.

PAL/LISER'S ISLANDS, a cluster of islands in the South Pacific Ocean; the largest about fifteen miles long and nine broad; connected together by a reef of coral rocks, and difficult of access. Lat. 15. 16. S. lon. 146. 147. W.

PALLIUM, or **PALL**, *f.* A pontifical ornament worn by popes, patriarchs, primates, and metropolitans, of the Romish church, over their other garments, as a sign of their jurisdiction. It is in form of a band, or fillet, three fingers broad, and encompasses the shoulder; whence, by some authors, it is called *super-humeral*. It has pendants, or strings, about a palm long, both before and behind; with little laminae of lead, rounded at the extremes, and covered with black silk, with four red crosses.

Some, with Eusebius, will have the pallium to have been introduced by pope Linus; adding that, as the ephod was the mark of the pontifical authority in the Jewish synagogue, so is the pallium in the Romish church. Others have observed, that there is no mention of it before the year 336. Lastly, others will have it to have been first granted by Constantine the Great to pope Sylvester; from whence it passed to the other patriarchs and archbishops.

The pallium, it is certain, was originally part of the *imperial* habit, being then a rich robe of state, very magnificent, and reaching quite to the ground; and it has been said, that the bishops of Rome were allowed to wear it by Constantine the Great, and that, in process of time, the same honour was granted by the emperors to the other patriarchs. Hence, when they were either driven from their sees, or voluntarily quitted them, they returned their palls to the emperors. When the popes first took upon them to grant that honorary badge, which they did before the pontificate of Gregory the Great, chosen in 590, they did not presume to do it till they had obtained leave of the emperor. But the successors of Gregory, upon the decline of the empire, took upon them to bestow that mark of distinction independently of them, and as a gift of their own. However, that it might no longer be deemed part of the imperial habit, which it was treasonable to wear without leave from the emperors, they changed its ancient form to the present.

At what time the popes assumed the disposing of the pallium independently of the emperors, is not well known; but it is certain, that no bishop was obliged to apply to Rome for it till the year 742, when Boniface bishop of Mentz persuaded the bishops of France and Germany to pass a decree, obliging their metropolitans to apply to the pope for that ornament, and to promise, upon their receiving it, a canonical obedience to the commands of St. Peter. This practice proving very favourable to the ambitious designs of the bishops of Rome, they spared no pains to impose it upon all metropolitans; issuing,

issuing, with this view, various decrees concerning the nature, virtue, and necessity, of the pallium; till at length they proceeded to declare it unlawful for a metropolitan, archbishop, or primate, to exercise any branch of his power, till he had received his pall from Rome; nay, in several decrees, the metropolitanical jurisdiction and power were said to be conferred by the pall; and thus they made the pope the fountain of all ecclesiastical power and authority. This doctrine seems to have been first broached in the ninth century, though vigorously opposed by Hincmar archbishop of Rheims, and several others. However, the doctrine prevailed; and the pall was declared by Innocent III. in the thirteenth century, to be an ensign or token of the plenitude of the apostolic power, and said to communicate a competent share of that power to those who received it from the hands of the popes. Till the time of Gregory VII. the new metropolitans were only required to send for their palls within the space of three months after their ordination; but this pope obliged all, unless prevented by some lawful impediment, to come for them in person to Rome; and the promise of canonical obedience, upon receiving their palls, was changed into an oath of allegiance, such as vassals by the feudal laws were obliged to take to their princes. Gregory the Great conferred the pallium without fee or reward; and, in a council held at Rome in 595, decreed that it should be given gratis; but it is well known, that in succeeding times the grant of it became one of the chief funds of the popish fee. Exorbitant sums were exacted not only for the palls that were sent to presbyters, or private bishops, when raised to the archiepiscopal dignity, but likewise for those that were sent to archbishops, on their translation from one see to another. For, by the canons, an archbishop is not to carry away his pall with him, but to demand a new one; and his successor is not to make use of the pall which his predecessor had left, but to apply to Rome for another. *Bower's Hist. of the Popes*, vol. iii.

The pope pretends to the sole right of conferring the pallium; though some patriarchs have granted it to their suffragans, having first received it themselves from the Roman see. Anciently, the pope used to send the pallium to certain of his diocesan bishops, on whom he laid a good part of his authority, and who were a kind of collaterals to him, as the patricii were to the emperors.

By the popish canon laws, a metropolitan, till he have received the pallium, cannot consecrate bishops or churches; and he may not be called *archbishop*, &c. Upon a translation, he must have the pallium afresh; and, till then, he cannot hold a synod, nor perform any of his archiepiscopal functions.

The use of the pallium is restrained to certain seasons and occasions; none but the pope having a right of wearing it always, and in all places.

The pope sometimes sends it to bishops of his own accord; and has sometimes given the right hereof to particular churches. But, among the Greeks, all the bishops wear the pallium.

PALLMALL, *f.* [from the Lat. *pila*, a ball, and *mal-leus*, a hammer.] A play in which a ball is struck with a mallet through an iron ring. The mallet itself which strikes the ball.—If one had *paille-mails*, it were good to play in this alley; for it is of a reasonable good length, straight and even. *French Garden for Eng. Ladies to Walk in*, 1621.—Several streets or walks, in France as well as in England, are called *Maille*, or *Mall*, from having been formerly used for this diversion. Such places are to be found on the heights of St. Cloud near Paris, and in the Champs Elysées; and in London we have the Mall in St. James's Park, and Pall Mall, where his majesty keeps his court.

PAL/LOR, *f.* [Latin.] Paleness.—There is some little change of the complexion from a greater degree of *pallor* to a less, possibly to some little quickening of redness. *Bp. Taylor's Artif. Handsome*.

PAL/LU, a town of France, in the department of the Mayenne: ten miles west of Alençon.

PALLUAU', a town of France, in the department of the Vendée: sixteen miles east-south-east of Chalons, and ten north-west of La Roche sur Yon.

PALLUAU', a town of France, in the department of the Indre: six miles east-south-east of Chatillon sur Indre, and sixteen north-west of Châteauroux.

PALM, *f.* [Sax. from *palma*, Lat. or from *παλαμη*, Gr. the hand.] The inner part of the hand; the hand spread out.—The word *palm*, meaning the hand, is retained in the French *paume*, the palm of the hand, and *jeu de paume*, a game where the ball is played with the palm of the hand. The Latin word *palam*, openly, in open view, bears analogy to the hand when spread open. *Gleanings in Etymology*, MS.

I try'd th' infallible prophetic way,

A poppy-leaf upon my *palm* to lay.

Dryden.

PALM, *f.* [*palme*, Fr. from *palmus*, Lat.] A measure of length, the breadth of the palm of the hand; about three inches.—The length of a foot is a sixth part of the stature; a span, one eighth of it; a *palm* or hand's-breadth, one twenty-fourth; a thumb's-breadth, or inch, one seventy-second; a forefinger's-breadth, one ninety-sixth. *Holder on Time*.

The Roman *palmus* was of two kinds. The *great palm*, taken from the length of the hand, answered to our span, and contained 12 fingers, digits, or fingers'-breadths, or 9 Roman inches, equal to about $8\frac{1}{2}$ English. The *small palm*, taken from the breadth of the hand, contained 4 digits or fingers, equal to about 3 English inches.

The Greek *palm*, or *doron*, was of two kinds also. The small contained 4 fingers, equal to little more than three inches. The great contained 5 fingers. The double Greek *palm*, called *dichas*, contained also in proportion.

The modern *palm* is different in different places where it obtains.—At Rome, the canna for woollens and silken stuffs is $78\frac{1}{2}$ English inches, = 8 palms; but the builder's canna $87\frac{1}{2}$ English inches, = 10 palms; at Naples, the *palm* is the 8th part of the canna, = $10\frac{1}{8}$ English inches; at Genoa, the *palm* is 10 inches; at Oporto, it is $8\cdot64$ inches.

PALM, *f.* [*palma*, Lat. the palm of the hand; because the leaves of several species spread out like a hand, the dactylian fingers of which are the dates.] A tree of which there are very many species. See **PALMÆ** and **PHŒNIX**.

Thou youngest virgin, daughter of the skies,

Whose *palmus* new pluck'd from Paradise

With spreading branches more sublimely rise. *Dryden.*

The palm is the emblem of victory, because it represents courage, whence victory arises; for the palm-branch, the more you draw it down, the more it rises up again, from its peculiar elasticity:

Namur subdu'd is England's *palm* alone:

The rest besieg'd, but we constrain'd the town. *Dryden.*

To **PALM**, *v. a.* To conceal in the palm of the hand, as jugglers.—*Palming* is held foul play amongst gamesters. *Dryden*.—They *palm'd* the trick that lost the game. *Prior*.

—To impose by fraud.—Moll White has made the country ring with several imaginary exploits *palmed* upon her. *Addison's Spect.*

If not by scriptures, how can we be sure,

Reply'd the panther, what tradition's pure?

For you may *palm* upon us new for old.

Dryden.

To handle.—Frank carves very ill, yet will *palm* all the meats. *Prior's Epigrams*.—To stroke with the hand. *Ainsworth*.

PALM (John-George), a learned German Lutheran divine, was born at Hanover in the year 1697. After pursuing his studies in different universities, duke Augustus-William of Brunswick and Lunenburg placed him

him in the convent of Riggdagshausen, in 1716; and in 1720 he nominated him his travelling-preacher. Three years afterwards Palm was made chaplain to the court of Wolfenbuttel, where he acquired the esteem of the duke and dukes. In the year 1727 he accepted an invitation to become pastor of the church of St. Peter and St. Paul at Hamburg, where he spent the remainder of his life, and was made rector of the academical institution in that city. He died in 1743, when only forty-six years of age. He was the author of, 1. *Liber Historicus de Codicibus Veteris et Novi Testamenti quibus B. Lutherus in conficienda Interpretatione Germanica usus est*, 1735, 8vo. 2. *Jesus the true Messiah*, 1731, 8vo. and various other works in the German language.

PALM-BARLEY, *f.* A kind of grain fuller and broader than common barley. *A/h.*

PALM ISLANDS, a chain of islands near the north-east coast of New Holland, extending about thirty miles in length, at the entrance of Halifax-bay. Lat. 18. 53. S. lon. 213. 25. W.

PALM-SUNDAY. The Sunday next before Easter is generally called *Palm-Sunday*, in commemoration of our Saviour's triumphal entry into Jerusalem, when the multitude that attended him strewed palm-branches in his way; in remembrance of which, *palms* were used to be borne here with us upon this day, till the second year of king Edward VI. *Wheatly.*

Palms are still used on this day, particularly in Roman-catholic countries, at least where they can be got. The custom exists even here in some degree, as far as is consistent with the nature of the climate. People go "a-palming," as they call it, early in the morning of that day; but, finding no palm-branches, they bring home some sprigs of the withy (a species of *Salix*) with its blossoms. These are called *palms* of course; and, as the catkins of the withy resemble in size and shape one of the species of hairy caterpillars, this has been called the *palmer*, or *palmer-worm*, which is very innocently defined by Dr. Johnson "a worm supposed to be so called because he wanders over all plants." *Gleanings in Etymology.*—See **PALMER** and **PALMER-WORM**.

PALMA, one of the Canary islands, about sixty miles in circumference, anciently called *Capraria*, said by some to be from a volcano of that name, though other writers conjecture that both the island and mountain were so called from the great number of *goats* bred here. It is agreed on all hands that the soil is fertile in corn, wine, and sugar-canes, as well as in fruits, quadrupeds, and birds of all kinds. Nuno de Penna relates, in his Historical Memoirs, that, on the 13th of November, 1675, a little after sun-set, there was a violent earthquake felt for forty miles round the island, attended with a dreadful noise, that continued without intermission for five days; during which the earth opened in horrible gaps in several places, but chiefly upon the Mountain of Goats, or *Capraria*, a mile and a half from the sea, from whence issued a violent fire and fierce flames, which vomited up great stones and large pieces of rock. The same thing happened in several adjacent places; and, in the space of fifteen minutes, no less than twenty-eight dreadful gulfs opened round the foot of the mountain; each of them throwing out flames, smoke, and liquid fire. The same author adds, that, on the 20th of November following, there was a second eruption of the mountain, which in the same manner poured forth torrents of melted stones and minerals, which ran for the distance of twenty-one miles, where at this day large heaps of cinders are to be seen. All the neighbouring lands were entirely wasted, and the people in consequence forced to quit their habitations.

This island has a handsome town of its own name, and a safe harbour, well frequented by the shipping of different nations, which come hither for wines; these being reckoned equal to Malmsey, and by some thought the

best of any produced in the Canaries. These wines, and particularly what is made at a place called Brenin, are bought up with avidity; and of this last there are exported to the West-Indies, and elsewhere, at least 12,000 pipes a-year. The number of inhabitants is estimated at 30,000. Lat. 28. 36. lon. 18. W.

PALMA, a town of South America, in the province of New Grenada, built in the year 1572: thirty-six miles north-west of Santa Fé de Bogota.

PALMA, a town of Naples, in the province of Lavora: fourteen miles east of Capua.

PALMA, or **PALME**, a town of Naples, in the province of Calabria Ultra, near the sea, destroyed by an earthquake. This place was a great mart for oil, of which there were, at the time of the destruction, upwards of 4000 barrels, which, being broken, the oil ran into the sea for some hours: eleven miles west-north-west of Oppido.

PALMA, a town of Sicily, in the valley of Mazara, first built in the year 1637, by one of the family of Chiavo Monte. In the neighbourhood there is a rich sulphur-mine. The number of inhabitants is about 6000. Not far from Palma, on a lake near the sea, white partridges are found. It is six miles south of Naro.

PALMA, a town of Spain, in the province of Cordova, on the Guadalquivir: twenty-seven miles south-west of Cordova.

PALMA, a town of Portugal, in Estremadura, on the right side of the river Cadaon: eighteen miles east of Setuval.

PALMA, a river of Brasil, which runs into the Tocantim in lat. 14. 16. S.

PALMA. See **MAJORCA**, vol. xiv. p. 168.

PALMA (Giacopo), called *The Old*, an eminent Italian painter, was born at Serinalta, in the territory of Bergamo. The date of his birth has been fixed by Lacombe at 1540; but Mr. Fuseli has given reasons for supposing that this period is much too late. He was sent at an early age to study in the school of Titian at Venice; and he imitated the delicacy of touch and softness of colouring of his master with so much success, that he was appointed to finish a Descent from the Cross left imperfect by Titian. He also copied the vivacity of colour and breadth of shade of Giorgione in his greatest performances. The works of the elder Palma are much esteemed for the noble taste of their composition, the natural and pleasing expression, the graceful airs of the heads, the union and harmony of colouring, and the delicacy of finishing. They are sometimes, however, faulty in point of correctness of drawing. His finest pieces were some of the earliest; and he fell off considerably in his later performances, though he died at the age of forty-eight.

PALMA (Giacopo), called *The Young*, great-nephew of the preceding, has been styled by Lanzi "the last painter of the good, and the first of the bad, epochs of the art at Venice." He was born in 1544, the son of Antonio Palma, an obscure painter, who first taught him the little he knew, and encouraged him to study the works of others, particularly those of Tintoretto and Titian. At the age of fifteen he obtained the patronage of the duke of Urbino, who sent him to Rome, and maintained him there for eight years, during which time he employed himself in copying the works of M. Angelo, of Raphael, and, above all, of Polidoro; and was employed by the pope to adorn one of the rooms of the Vatican. On his return to Venice he found but little employment, Tintoretto and Paolo Veronese occupying the places of renown, and being engaged in all the public works. Their disagreement with a celebrated architect and sculptor named Vittoria, furnished Palma with a patron, who, endeavouring to lower the esteem of his enemies, used his utmost efforts to establish the rival painter, assisted him with his advice, and found him employment. Their united endeavours failed however of success; and Palma was obliged to be contented to hold the third rank in the art

till their deaths left him without a rival. He had in the mean time painted in competition with them both, and produced very excellent works.

When he was left alone, and was much employed, he relaxed from the care and diligence he had formerly used, and his works became slight in execution; so much so, that Cesare d'Arpino, remarking upon the slightness of the style in which he painted, observed, that he meant to make some stay at Venice, to learn of him to make such admirable *sketches*. When price and time, however, were left to his own discretion, in which he did not abound, he produced some works worthy of his former fame; such as the altar-piece at the church of St. Cosmo and Damiano; the celebrated naval battle of Francesco Bembo, in the public palace; the Saint Apollonia at Cremona, &c. The compositions of the younger Palma are more distinguishable for their copiousness than the judgment with which they are conducted, and his design is more bold than correct. His excellencies are, richness of composition, force and variety of expression, freshness and transparency of tint, and lightness of touch. His works are numerous in the churches and palaces of Italy, and in foreign collections. A considerable number have been engraved, and some by his own hand: to his engravings he frequently signed his name at length; but sometimes used the monogram of a palm-branch crossing diagonally the letter P, as is represented on the preceding Engraving. *Fuseli's Pilkington.*

PALM'A CHRIS'TI. See ORCHIS and RICINUS.

PALMA LA NUOVA, a town of Italy, in the country of Friuli, on the borders of Goritz, situated on a canal which communicates with the Lisonzo. It is fortified and surrounded with nine bastions, which bear the name of nine Venetian noblemen. It is fifty-five miles north-east of Venice, and twenty-four north-west of Trieste. Lat. 46. 2. N. lon. 13. 16. E.

PALMA DI SO'LO, a sea-port town of the island of Sardinia, on the fourth coast: fifteen miles south-east of Villa de Iglesias. Lat. 39. 20. N. lon. 6. 24. E.

PALMA'DA, *f.* A blow on the hand with a ferula. *Bailey.*

PALMÆ, *f.* in botany, the palm-tribe, a most distinct and important, as well as stately and beautiful, natural order of plants, so named from *Palma*, the ancient appellation of the most valuable among them, the date-tree, whose foliage was consecrated, first by the Greeks, and then by the Romans, as an emblem of victory, and whose fruit has been a principal article of food in the east from the remotest antiquity to the present day. The word *palma* is supposed to have been applied to this tree, from the divisions of its leaves having some resemblance to the fingers and palm of the hand, whence, perhaps, by an association of ideas, the fruit came to be called *δάκτυλι*, from *δάκτυλος*, a finger, to which its likeness is at first not apparent. The Greeks named this kind of palm *φοινίξ*, which Linnæus has retained. See PHŒNIX. That great botanist terms the natural order in question "princes of the vegetable kingdom, of Indian origin, distinguished by their theated and many-spiked flowers, their flowing habit, their lofty stature, the simple elegance of their unbranched long-enduring stem, the leafy evergreen garlands with which they are crowned, and their princely treasures of rich fruit. They are tributary to the first order, or *Primates*, amongst animals; more especially to the lord of the animal creation, who is destined, in a state of nature, to dwell among them."

The botanical arrangement of *Palma* was, in the early days of Linnæus, a work of considerable difficulty. Tournefort had distinguished no proper genera in this order, nor Plumier more than one. So imperfect were the accounts of their flowers in early botanical works, and so impossible was it for the author of the sexual system to procure access, in most instances, to the reality, that he could not ascertain enough of their structure to refer more than a very few to his classes and orders; hence he

assembled as many as he knew of the family in an appendix to his system, except Calamus, of whose relationship to the rest he was not aware. See the article BOTANY, vol. iii. p. 259, 289, 294. The genera now understood to belong to this order are—*Areca*, *Bactris*, *Borassus*, *Caryota*, *Chamærops*, *Cocos*, *Corypha*, *Cycas*, *Dracæna*, *Elæis*, *Elate*, *Hydocharis*, *Licuala*, *Mauritia*, *Nipa*, *Phoenix*, *Rhapis*, *Stratiotes*, *Thrinax*, and *Zamia*. To these Monf. Labillardiere has added a newly-discovered genus, *ARENG*. He calls his plant

Areng facchifera, or sugar-bearing areng. It is very common in the Moluccas; and, like the other species of date-tree, is of very extensive utility. By proper incisions, a juice is obtained from it, which affords very good sugar by evaporation. *Mem. de l'Institut National*, tome iv. 1802.

The following characteristic sketches of this remarkable family of the vegetable kingdom, are extracted from the magnificent botanical work of Messrs. Humboldt and Bonpland, completed at Paris in 1816.

The family of the palms thrives best between the tropics, in the plains, and to the height of 560 fathoms, in places where the mean temperature in summer is from 15° to 28° of the centigrade thermometer; and, excepting the island of Cuba, to which the north wind from Canada brings a colder air, where the cold in winter is not below 15°. Yet some, which the travellers believe to have been wholly unknown previously to their visit to the Andes, approach the limits of everlasting snow. If the family of the palms is distinguished by beauty of form and its large size from almost all the other families of vegetables, so likewise does it surpass them in the various uses to which they are applied. They furnish articles of the most dissimilar nature; wine, oil, wax, flour, sugar, and salt.

In the tracts to the north of the line, between the mountains of Caraccas and the river of Amazons, traversed by Humboldt and Bonpland, they found the palms in general in blossom in January and February, but some of them flower at other seasons of the year. Their fecundity is astonishing: the powerful action of the sap is developed not only in thick umbrageous foliage, but also in an innumerable multitude of flowers and fruit. Not only the fields planted with palm-trees, but even the soil that has never been cultivated by man, is frequently covered to the depth of three inches with the fruit of the *Cocos butyracea*, the *Mauritia*, &c. Every flower-capsule of the date-tree (*Phoenix dactylifera*) contains, according to Kæmpfer, above 12,000 male flowers. Humboldt and Bonpland have found a much greater number upon another species. In one single catkin-shaped bunch of flowers, of which each capsule contains from 110 to 120, they counted 1800 male flowers; so that the total number in each capsule may be computed at 207,000 flowers. According to a similar calculation, every branch of a species which furnishes an excellent aliment on the banks of the Oroonoko, produces 8000 fruits, many of which indeed drop off before maturity. In the palm-grounds planted with the *pihiguo*, each tree yields annually upon an average 400 fruits of the shape of apples; and the Franciscans on the Oroonoko and Guainia know from experience, that, whenever there is an uncommonly abundant crop of palm-fruit, the Indians grow remarkably fat. And M. Humboldt observes, that those species, the pith of which furnishes a kind of sago-flour, that forms an excellent article of food for the inhabitants of the New World, deserve to be particularly recommended to the notice of future travellers in America.

The following account of the vegetation of this tribe, extracted from Desfontaines, is published in Lamarck's Dict. vol. iv. "When the seed of a palm-tree is committed to the earth, the leaves unfold in succession, and increase in number, during four or five years. The crown of the root dilates in the same proportion. The bulb, formed by the reunion of the footstalks of the leaves, swells

swells insensibly, its solidity gradually augments, and at length the stem rises above the surface of the ground, of the full diameter that it ever will acquire. The leaves, produced every spring, originate always from the summit. The older ones, standing below the others, gradually dry up, and, on separating from the stem, leave behind them circular impressions, which furrow its surface, and mark the years of its age, as long as it continues to grow. The stem is exactly cylindrical from top to bottom; and, if its measure be taken at different periods, no increase of diameter will ever be discovered. This fact did not escape Kämpfer." The same able writer remarks, nevertheless, that palm-trees are liable to accidental irregularities in their growth, either from a deficiency of nourishment, whence they become slender in that portion of their stems elongated under such circumstances; or from a superabundance of food, whence the new part proves of a greater diameter than the old; for the latter retains, in both cases, its original dimensions. Such being the mode of increase in the plants of this natural order, and their duration very long, amounting sometimes to 800 years or more, no wonder that they attain an extraordinary degree of elevation, much exceeding the generality of trees, though scarcely equal to the Norfolk-island pine. Yet, notwithstanding this great loftiness of growth, botanists have doubted whether they strictly ought to be denominated trees or herbs. They certainly have not the proper trunk, gradually augmented by successive annual concentric layers, which is characteristic of a tree. Their annual circles of leaves all spring in reality from the root, or at least from its singularly-protruded crown; but, so little of any such protrusion is discernible in herbaceous plants, which die down to the surface of the earth every winter, that the difference between them and the palm-tribe is abundantly marked. Linnæus, not knowing whether to call their foliage leaves, adopted the term *frons*, a frond or bough; but, as it seems to us, without any necessity. That they were by the ancients very improperly termed branches, we readily allow; but the objections that "they have no bud for the following year, neither have they the substance of leaves, nor do they, like leaves, all wither and fall off together," (see Lin. Prælect. in Ord. Nat. 23.) appear to us very unsatisfactory. They have, in fact, a central bud, like trees of tropical countries, though not the scaly hybernacula appropriated to those of cold climates; their substance is much like that of a variety of other leaves; and they fall off in succession, like the foliage of other evergreen plants. When their whole summit is cut off, the plant perishes, they having no power of producing lateral buds. See the article PHŒNIX, and the other genera enumerated above.

PALMAJO'LA, a small island in the Mediterranean, near the coast of Italy. Lat. 42. 53. N. lon. 9. 35. E.

PALMAR, *adj.* Belonging to a palm or hand's-breadth. *Cole.*

PALMAR, a river of Benin, which runs into the Atlantic in lat. 6. 25. N. lon. 3. E.

PALMAR, a town of South America, in the audience of Quito: forty miles south-west of Riabamba.

PALMAR POI'NT, a cape on the west coast of Africa. Lat. 5. 30. S.

PALMAR'IA, a small island in the Mediterranean, about forty-five miles from the coast of Naples: three miles west from the island of Ponza. Lat. 40. 58. N. lon. 12. 53. E.

PALMAR'IA, a small island in the Mediterranean, near the coast of Genoa, at the entrance of the gulf of Spezza: eight miles south of Spezza. Lat. 44. 4. N. lon. 9. 40. E.

PALMAR'IGI, a town of Naples, in the province of Otranto: three miles west-south-west of Otranto.

PALMAR'IS, *f.* A muscle of the palm of the hand.

PALMARO'LA, or **PALMARUOLA**, a small island in the Mediterranean, near the coast of Naples: four miles north-west of Ponza. Lat. 41. 3. N. lon. 12. 55. E.

PALMARY, *adj.* [*palmaris*, Lat. principal, most remarkable: *Palmare opus*, a principal work. *Palmary* is probably of recent introduction into our language. Lesslie, in his Short Method with the Deists, has the Latin expression: "When his *opus palmare* comes out, &c." Todd.] Principal; capital.—Sentences proceeding from the pen of the first philosopher of the age, in his *palmary* and capital work! *Bp. Horne's Lett. on Infidelity*, 1784.—*Palmary* may be applied to any piece which has "won the palm," whether prose or poetry. *MS. Gleanings*.

PALMAS, a small island in the Pacific Ocean, near the coast of Peru. Lat. 4. 35. N.

PALMAS, a town of South America, in the province of Tucuman: thirty miles south of St. Miguel de Tucuman.

PALMAS, one of the Philippine islands, near the south-east coast of Mindanao.

PALMAS, a river of Mexico, which runs into the bay of Campechy in lat. 18. 20. N. lon. 94. 20. W.

PALMAS, a river of North America, formed by the junction of the rivers Nicas and Saucedo, in New Biscay; after the union, the course is due east for about 200 miles, crossing the province of New Leon, when it falls into the Gulf of Mexico in lat. 25. N. lon. 98. 46. W.

PALMAS, or **PALMEZ**, the principal town of Gomera, one of the Canary Islands.

PALMATE, or **PALMATED**, *adj.* [*palmatum*, Lat.] Webbed, like the feet of some water-birds.—The broad and *palmated* feet of the aquatic birds perform the office of oars. *Tr. of Buffon's Hist. of Birds*.—Applied to the leaves of some plants, which are deeply divided into lobes, like the fingers on the hand.

PALMATORY, *f.* A ferula, an instrument to strike the palm of the hand. *Cole.*

PALMAW', a town of Bengal: twenty-four miles south-south-west of Rogonatpour. Lat. 23. 13. N. lon. 86. 54. E.

PALME, (Le), a town of France, in the department of the Aude: six miles north-west of Leucate.

PALMEIRA, a small island in the Persian Gulf, near Cape Bardistan.

PAL'MELA, a town of Portugal, in Estremadura, with a castle on a rock: six miles north of Setuval.

PALMER, *f.* [from *palm*.] A pilgrim; because they who returned from the holy land carried branches of palm, or supported themselves on a staff made of palm-tree:

I'll change
My sceptre for a *palmer's* walking-staff. *Shakespeare.*

A palmer differed from a pilgrim: the *pilgrim* travelled to some certain place; the *palmer* to all, and not to any one in particular; the *pilgrim* might abandon his profession, and often did so when he had performed the pilgrimage he had vowed; but the *palmer* was a religious beggar (*petens elemosynas*, asking alms) for life, and therefore persisted in wandering about till he either died of hunger, or had the good luck to get murdered, either of which methods of *finishing their course*, was called "obtaining the palm."

Behold yon isle, by *palmer*s, pilgrims, trod,
Men bearded, bald; cowl'd, uncowl'd; shod, unshod. *Pöps.*

PALMER, a township of America, in Hampshire-county, Massachusetts, on the south side of Chickapee-river; incorporated in 1752, and containing 1039 inhabitants.

PALMER (John), an actor of very considerable talents, belonging to Drury-lane theatre, was born in London about 1742, and came on the stage in 1762. In many parts he had no competitor, and perhaps will never have a superior; for instance, in Stukeley, Joseph Surface, Villeroy, Glenalvon, Brush, Brads, Young Wilding, &c. No performer ever had a wider range of characters, showed more industry, or exercised his talents with more success. His final exit was singularly awful. On the 2d of August,

1798,

1798, while performing in the play of the Stranger, at the Liverpool theatre, after uttering the line, "There is another and a better world!" he fell on his back, heaved a convulsive sigh, and immediately expired. Those words are engraved on his tomb. *Jones's Biographical Dict.*

PALMER TOWN, a town of New York, thirty-two miles south-west of Ticonderoga.

PALMER-WORM, *f.* A worm covered with hair. —A flesh-fly, and one of those hairy worms that resemble caterpillars, and are called *palmer-worms*, being conveyed into one of our small receivers, the bee and the fly lay with their bellies upward, and the worm seemed suddenly struck dead. *Boyle.*

PALMERIN, a town of Africa, in Baol. Here is a mart for hides and teeth. Lat. 13. 30. N. lon. 16. 21. W.

PALMERSTON'S ISLAND, an island in the South Pacific Ocean, discovered by captain Cook in June 1774. In the "Missionary Voyage," it is described as a group of small islets, eight or nine in number, connected together by a reef of coral rocks, and lying in a direction nearly circular. Captain Wilson and some of his companions landed upon one of these isles, which is not a mile in circuit, and which, at high-water, is not more than four or five feet above the level of the sea. The soil is coral sand, with an upper stratum of blackish mould, produced from rotten vegetables. The inner area of the islet is covered with cocoa-nut trees, which, decaying and falling, form a thick underwood. They saw a number of men-of-war birds, tropic-birds, and boobies. Among the trees there was plenty of red crabs, dragging after them a shell in form of a periwinkle, but larger, being in diameter about two or three inches. When they ran along the ground, they only put their claws out; but, being touched, they withdrew themselves wholly into their shell. Here was seen the submarine grotto described in Cook's Third Voyage. At one part of the reef, which bounds the lakes within, almost even with the surface, there is a large bed of coral, which affords a most enchanting prospect. Its base, which is fixed to the shore, extends so far that it cannot be seen, so that it appears to be suspended in the water. The refulgence of the sun, when the sea is unruffled, exposed to view the various sorts of coral in the most beautiful order; some parts luxuriantly branching into the water, others appearing in a vast variety of figures, and the whole heightened by spangles of the richest colours, glowing from a number of large clams interspersed in every part. This scene was much improved by the multitude of fishes that gently glided along, seemingly with the most perfect security: their colours were the most beautiful that can be imagined, blue, yellow, black, red, &c. far excelling any thing that can be produced by art. Our navigators observe, that no traces appear of this island's ever having been inhabited. Lat. 18. 4. S. lon. 163. 10. W.

PALMETTO, *f.* A species of palm. It grows in the West Indies to be a very large tree: with the leaves the inhabitants thatch their houses; and these leaves, before they are expanded, are cut and brought into England to make women's plaited hats; and the berries of this tree were formerly much used for buttons. See **CHAMAROPS**. Broad o'er my head the verdant cedars wave,
And high *palmettos* lift their graceful shade. *Thomson.*

PALMETTO, a town of the island of St. Christopher, situated on a bay to which it gives name: three miles west of Bassé Terre.

PALMETTO POINT, a cape on the north coast of Jamaica. Lat. 18. 18. N. lon. 76. 20. W. —A cape on the south coast of Jamaica. Lat. 18. 7. N. lon. 77. 57. W.

PALMIERI (Matteo), an Italian man of letters, born at Florence about 1405, was descended from an ancient and illustrious family, and educated in the sciences and learned languages under the ablest masters. He was several times entrusted by his fellow-citizens with offices of magistracy, and rose to the supreme dignity of gonfalonier of justice. He was likewise appointed to various important

embassies to the popes, the emperor Frederic III. Alphonso king of Naples, the republic of Sienna, and other states. He died in 1475, at the age of 70. As a literary man, his most considerable work was a "Chronicle," from the creation down to his own times. He also wrote "The Life of Niccolo Acciajuoli," which has been published by Muratori; as likewise his book "De Captivitate Pisorum;" and a work in form of a dialogue, "Della Vita Civile," several times printed, and translated into French. He was moreover a poet; and, in imitation of Dante, composed in terza-rima three books, entitled "Citta di Vita," never printed, but extant in manuscript in several libraries. This poem obtained great applause, but was exposed to theological censure, on account of some errors in divinity, particularly that of representing human souls as having been in a former state those angels who, in the grand rebellion in heaven, stood neuter. These notions, regarded as heresies, caused the book to be solemnly condemned to the flames; a fate which some writers have also attributed to the author, but erroneously.

The Chronicle of Matteo was continued to the year 1482 by a native of Pisa, very nearly his namesake, viz. *Matteo Palmieri*. This writer, who was apostolic secretary, and died in 1483, also translated from the Greek the fabulous narration of Aristeas concerning the translators of the Septuagint, and some other works of antiquity. *Gen. Biog.*

PALMIFEROUS. *adj.* [*palmi* and *fero*, Lat.] Bearing palms.

PALMIFOLIA, *f.* in botany. See **ZAMIA**.

PALMINOPOS, a town of Spain, in New Castile: twenty-five miles north-north-west of Cuenca.

PALMIPED, or **PALMIPEDOUS**, *adj.* [*palma* and *pes*, Lat.] Webfooted; having the toes joined by a membrane. —Water-fowl, which are *palmipede*, are whole-footed, have very long necks, and yet but short legs; as swans. *Ray.*

PALMIPES, *f.* [Lat.] an ancient long measure, containing a foot and a palm, or five palms; and was less than the cubit by one palm.

PALMIRAS. See **MAYAPARA**, vol. xiv.

PALMIS AFFINIS. See **GRAS**.

PALMISTER, *f.* [from *palm*.] One who deals in palmistry. —If we curiously advise with the *palmisters*, we shall find the mind written in the hand! *Austin's Hæc Homo*. —Some vain *palmesters* have gone so far as to take upon them, by the sight of the hand, to judge of fortunes. *Bp. Hall*.

PALMISTRY, *f.* [*palma*, Lat.] The cheat of foretelling fortune by the lines of the palm: it is prohibited by 1 and 2 Ph. and Mary, c. 4. —We shall not query what truth is in *palmistry*, or divination, from lines of our hands, of high denomination. *Brown's Vulg. Err.*

With the fond maids in *palmistry* he deals;
They tell the secret first which he reveals. *Prior.*

Addison uses it humorously for the action of the hand. —Going to relieve a common beggar, he found his pocket was picked; that being a kind of *palmistry* at which this vermin are very dexterous. *Speci. N° 130.*

PALMJUNCUS, *f.* in botany See **CALAMUS** and **FLAGELLARIA**.

PALMODECIA, *f.* in botany. See **CONVOLVULUS**.

PALMO'LI, a town of Naples, in Abruzzo Citra: thirteen miles east-north-east of Civita Borella.

PALMS, (Island of), a narrow island on the coast of Africa, at the entrance of the river Senegal, about six miles in length.

PALMUS, *f.* [from the Greek *πάλω*, to vibrate.] The shivering or quick vibration of the heart. A medical term.

PALMY, *adj.* Bearing palms. —She, flying, left the *palmy* plains behind. *Dryden.*

Betwixt them lawns, or level downs, and flocks

Grazing the tender herb, were interpos'd,

Or *palmy* hillock. *Milton's P. L.*

Flourishing; victorious. —In the high and *palmy* state of the

the monarchy of France, it fell to the ground without a struggle. *Burke on a Regicide Peace.*

In the most high and *palmy* state of Rome,
A little ere the mightiest Julius fell,
The graves stood tenantless.

Shakespeare.

PALMYRA, or TADMOR, a celebrated city of Syria, now in ruins, situated in the midst of a large plain, surrounded on three sides by a long chain of mountains. This city, to which oriental commodities were carried in ancient times, was originally built by king Solomon after he had conquered the king of Hamathzoba, a petty Syrian prince, within whose dominions the country lay in which this city was afterwards erected. It was called by Solomon *Tadmor*, which signifies "the Place of Palms;" and, from its situation in the midst of a sandy desert which surrounded it on all sides, "Tadmor in the Wilderness."

History is silent as to the fate and circumstances of this city during the great revolutions in the several empires of the east; but it may well be supposed, that so advanced a garrison as this was, being above 300 miles from Jerusalem, continued not long in the possession of the Jews, who, immediately after Solomon, fell into civil dissension, and divided their force; so that, without doubt, it submitted to the Babylonian and Persian monarchies, and afterwards to the Macedonians under Alexander and the Seleucidæ. But, when the Romans advanced to these parts, and the Parthians seemed to put a stop to their farther conquests in the east, then was this city of Palmyra, by reason of its situation, being a frontier, and in the midst of a vast sandy desert, where armies could not well subsist to reduce it by force, courted and caressed by the contending princes, and permitted to continue a free state, a mart or staple for trade, for the convenience of both empires, as we learn from the information both of Appian and Pliny. Palmyra is first mentioned by the Roman historians as a place which Mark Antony, after his victory at Philippi, about 40 years B. C. attempted to plunder, pretending that it had not observed a just neutrality between the Romans and Parthians. When the Romans under Trajan had made it appear, by his victories, that there was no comparison between their power and that of the Parthians, (Trajan having taken Babylon, and Ctesiphon, the seat, at that time, of the Parthian empire,) the Palmyrenes were induced to declare for the Romans; which they did, by submitting themselves to the emperor Adrian, about the year of Christ 130, when Adrian made his progress through Syria into Egypt. This magnificent emperor, being highly delighted with the situation and native strength of the place, situated on an extensive plain, and surrounded on three sides by a vast chain of mountains, determined to furnish it with various splendid edifices and ornaments; and at this time he probably conferred upon it the privileges of a "Colonia Juris Italici," which, as we learn from Ulpian, it actually enjoyed; and the inhabitants of the city were induced by gratitude to call themselves "Hadrianopolitæ." Many of its marble pillars, particularly those of the long porticos, (hereafter to be more particularly described,) were probably the gift of this emperor.

From Adrian to Aurelian, about 140 years, Palmyra continued to flourish and increase in wealth and power under the protection of the Romans; but, when the defeat and captivity of Valerian had so much weakened the empire, that the Persians seemed to be in a fair way of becoming masters of all the eastern provinces, the Palmyrenians began to entertain thoughts of recovering their liberty. Odenatus, prince of Palmyra, sent a very respectful letter to Sapor king of Persia, on his return, accompanied with considerable presents; but by that haughty conqueror his letter and embassy were treated with the most provoking contempt. With this injurious treatment Odenatus was so provoked, that he swore either to bring down the pride of the haughty conqueror, or die in the attempt. Of the war of Odenatus with the Persians, however, we know very little: only that, though the latter were

often vanquished, and the independence of Palmyra established for the present, yet Valerian was never released from his captivity, though Odenatus earnestly wished to have the honour of rescuing him from his enemies. See ODENATUS, vol. xvii. p. 398.

Odenatus enjoyed his sovereignty but a very short time; being murdered by his nephew, who was soon after put to death by Zenobia, the wife of Odenatus. This lady is said to have been possessed of very extraordinary endowments both of body and mind, being, according to Mr. Gibbon, almost the only Asiatic woman who is recorded to have overcome the obstacles arising from the confined situation of the fair sex in that part of the world. Immediately on taking vengeance for the murder of her husband, she assumed the sovereignty, under the title of queen of the East, wore the diadem, and appeared with all the distinctions of imperial rank. Gallienus, on the intelligence of the death of Odenatus, having sent a general to conduct the war against the Persians in his stead, hostilities took place between him and Zenobia, who defeated him, and obliged him to retreat to Europe. She governed with equal vigour and policy; and, entertaining vast projects of dominion for herself and her three sons, she employed an interval of peace in the reign of the emperor Claudius II. in annexing Egypt to the extensive territories which Odenatus had possessed. By her general Zabdas she defeated and subjugated the Egyptians; and, the Roman general Probus or Probatus, making an attempt to recover the country, he was taken prisoner, and in despair put an end to his life.

She continued to aggrandize herself in Asia, and her authority was recognized both in Cappadocia and Bithynia, when Aurelian succeeded to the Roman empire. This martial prince, as soon as he had established tranquillity in the west, resolved to wipe off the disgrace of suffering the richest provinces in the east to be usurped by a female. He crossed over to Asia with a powerful army; and his presence soon restored obedience to the province of Bithynia, already shaken by the arms and intrigues of Zenobia. Advancing at the head of his legions, he accepted the submission of Ancyra; and was admitted into Tyana, after an obstinate siege, by the help of a perfidious citizen: a superstitious reverence induced him to treat with lenity the countrymen of Apollonius the philosopher. Antioch was deserted on his approach; till the emperor, by his salutary edicts, recalled the fugitives, and granted a general pardon to all who, from necessity rather than choice, had been engaged in the service of the Palmyrenian queen. The unexpected mildness of such a conduct reconciled the minds of the Syrians, and, as far as the gates of Emesa, the wishes of the people seconded the terror of his arms.

Zenobia would have ill deserved her reputation, had she indolently permitted the emperor of the West to approach within a hundred miles of her capital. The fate of the East was decided in two great battles; so similar in almost every circumstance, that we can scarcely distinguish them from each other, except by observing, that the first was fought near Antioch, and the second near Emesa. In both, the queen of Palmyra animated the armies by her presence, and devolved the execution of her orders on Zabdas, who had already signalized his military talents by the conquest of Egypt. The numerous forces of Zenobia consisted for the most part of light archers, and of heavy cavalry clothed in complete steel. The Moorish and Illyrian horse of Aurelian were unable to sustain the ponderous charge of their antagonists. They fled in real or affected disorder, engaged the Palmyrenians in a laborious pursuit, harassed them by a desultory combat, and at length discomfited this impenetrable but unwieldy body of cavalry. The light infantry, in the mean time, when they had exhausted their quivers, remaining without protection against a closer onset, exposed their naked sides to the swords of the legions. Aurelian had chosen these veteran troops, who were usually stationed on the Upper Danube, and whose valour had been severely tried in the Alleman-

nic war. After the defeat at Emesa, Zenobia found it impossible to collect a third army. As far as the frontier of Egypt, the nations subject to her empire had joined the standard of the conqueror. Palmyra was the last resource of the widow of Odenatus. She retired within the walls of her capital; made every preparation for a vigorous resistance; and declared, with the intrepidity of a heroine, that the last moment of her reign and of her life should be the same.

In his march over the sandy desert, between Emesa and Palmyra, the emperor Aurelian was perpetually harassed by the Arabs; nor could he always defend his army, and especially his baggage, from those flying troops of active and daring robbers, who watched the moment of surprise, and derided the slow pursuit of the legions. The siege of Palmyra was an object far more difficult and important; and the emperor, who with incessant vigour pressed the attacks in person, was himself wounded with a dart. "The Roman people (says Aurelian in an original letter) speak with contempt of the war which I am waging against a woman. They are ignorant both of the character and of the power of Zenobia. It is impossible to enumerate her warlike preparations, of stones, of arrows, and of every species of missile weapons. Every part of the walls is provided with two or three ballistæ, and artificial fires are thrown from her military engines. The fear of punishment has armed her with a desperate courage. Yet I trust still in the protecting deities of Rome, who have hitherto been favourable to all my undertakings." Doubtful, however, of the protection of the gods, and of the event of the siege, Aurelian judged it more prudent to offer terms of an advantageous capitulation: to the queen, a splendid retreat; to the citizens, their ancient privileges. His proposals were obstinately rejected, and the refusal was accompanied with insult.

The firmness of Zenobia was supported by the hope, that in a very short time famine would compel the Roman army to repossess the desert; and, by the reasonable expectation that the kings of the east, and particularly the Persian monarch, would arm in the defence of their most natural ally. But fortune, and the perseverance of Aurelian, overcame every obstacle. The death of Sapor, which happened about this time, distracted the councils of Persia; and the considerable succours that attempted to relieve Palmyra, were easily intercepted either by the arms or the liberality of the emperor. It was then that Zenobia resolved to fly. She mounted the fleetest of her dromedaries; and had already reached the banks of the Euphrates, about sixty miles from Palmyra, when she was overtaken by the pursuit of Aurelian's light-horse, seized, and brought back a captive to the feet of the emperor. Her capital soon after surrendered, and was treated with unexpected lenity. The arms, horses, and camels, with an immense treasure of gold, silver, silk, and precious stones, were all delivered to the conqueror; who, leaving only a garrison of 600 archers, returned to Emesa, and employed some time in the distribution of rewards and punishments at the end of so memorable a war, which restored to the obedience of Rome those provinces that had renounced their allegiance since the captivity of Valerian.

When the Syrian queen was brought into the presence of Aurelian, he sternly asked her, How she had presumed to rise in arms against the emperors of Rome? The answer of Zenobia was a prudent mixture of respect and firmness: "Because I disdained to consider as Roman emperors a Gallienus, and others like him. You alone I acknowledge as my conqueror and my sovereign." But, as female fortitude is commonly artificial, so it is seldom steady or consistent. The courage of Zenobia deserted her in the hour of trial: she trembled at the angry clamours of the soldiers, who called aloud for her immediate execution; forgot the generous despair of Cleopatra, which she had proposed as her model; and ignominiously purchased life by the sacrifice of her fame and her friends. It was to their councils, which governed the weakness of her sex, that she

imputed the guilt of her obstinate resistance; it was on their heads that she directed the vengeance of the cruel Aurelian. The fame of Longinus, who was included among the numerous, and perhaps innocent, victims of her fear, will survive that of the queen who betrayed, or the tyrant who condemned, him. See LONGINUS, vol. xiii. p. 623. This event is dated in 273.

The person of Zenobia was reserved to decorate the triumph of Aurelian, a spectacle of peculiar splendour. The unfeeling pride of the Romans had established the custom of exhibiting to the eyes of the public the royal captives made by the triumphant general who had concluded a successful war; and no delicacy of sentiment was likely to induce a fierce imperial soldier to forego such an indulgence of insolent ostentation. On the appointed day the pompous procession moved to the capitol, a principal figure in which was Zenobia following, on foot, a magnificent chariot, which, in her prosperity, she had designed for a far different entry into Rome. She was encircled with chains of gold borne up by slaves, and almost sunk under the load of jewels with which she was adorned. No particulars are related of her behaviour in a scene which Cleopatra died to avoid; but history informs us, that the victor afterwards treated her with humanity, assigning her an agreeable residence at Tibur, where she passed the remainder of her days as a Roman matron. Some writers assert that she entered into a second marriage with a senator of Rome, and that from this union sprung a Roman progeny of Zenobia, which was subsisting to the fifth century; but others suppose that these might be descendants of her daughters, whom Aurelian married into families of distinction. Her surviving son, Vaballath, withdrew into Armenia, where the emperor bestowed on him a small principality.

Returning from the conquest of the east, Aurelian had already crossed the straits which divide Europe from Asia, when he was provoked by the intelligence that the Palmyrenians had massacred the governor and garrison which he had left among them, and again erected the standard of revolt. Without a moment's deliberation, he once more turned his face towards Syria. Antioch was alarmed by his rapid approach, and the helpless city of Palmyra felt the irresistible weight of his resentment. We have a letter of Aurelian himself, in which he acknowledges, that old men, women, children, and peasants, had been involved in that dreadful execution which should have been confined to armed rebellion: and, although his principal concern seems directed to the re-establishment of a Temple of the Sun, he discovers some pity for the remnant of the Palmyrenians, to whom he grants the permission of rebuilding and inhabiting their city. But it is easier to destroy than to restore: the seat of commerce, of arts, and of Zenobia, gradually sunk into an obscure town, a trifling fortress, and at length a miserable village.

The destruction of Palmyra was, as we have observed, not immediate, but gradual, because we find it mentioned in history as a very considerable place after this period, though not the seat of government, as in times past, when there were no less than sixteen cities under its jurisdiction. The ruins of Palmyra itself are allowed by all who have visited them, to be equal, if not superior, to any thing of the same kind yet subsisting in the world, and consequently still remain a proof of the wealth and magnificence of its ancient masters.

With respect to these ruins, they appear to be of two different and distinct periods; the oldest are so far decayed as not to admit of menfuration, and seem to have been reduced to that state by the hand of time; the others appear to have been broken into fragments by violence. Of the inscriptions, none are earlier than the birth of Christ, and none are later than the destruction of the city by Aurelian, except one, which mentions Dioclesian.

It is scarcely less difficult to account for the situation of this city than for its magnificence. The most probable conjecture is, that, as soon as the springs of Palmyra were discovered

discovered by those who first traversed the desert in which it is situated, a settlement was made there, for the purpose of carrying on the trade of India, and preserving an intercourse between the Mediterranean and Red Sea. This trade, which flourished long before the Christian era, accounts not only for its situation, but also for its wealth. As it lay between Egypt, Persia, and Greece, it was natural to expect that traces of the manners and sciences of those nations should be discovered among the Palmyrenes; who, accordingly, appear to have imitated the Egyptians in their funeral rites, the Persians in their luxury, and the Greeks in their buildings; and therefore the buildings, which now lie in ruins, were probably neither the works of Solomon, nor of the Seleucidæ, nor, few excepted, of the Roman emperors, but of the Palmyrenes themselves.

Palmyra was formerly encompassed by palms and fig-trees, and covered an extent of ground, according to the Arabs, near ten miles in circumference; and might probably have been reduced to its present confined and ruined state by quantities of sand, driven over it by whirlwinds. The walls of the city are flanked square towers; and it is probable, by their general direction, that they included the great temple, and are three miles in circumference. But, of all the monuments of art and magnificence in this city, the most considerable is the Temple of the Sun. The whole space containing its ruins, is a square of 220 yards, encompassed with a stately wall, and adorned with pilasters within and without, to the number of sixty-two on a side. Within the court are the remains of two rows of very noble marble pillars, thirty-seven feet high, with their capitals of most exquisite workmanship. Of these only fifty-eight remain entire; but there must have been many more, for they appear to have gone round the whole court, and to have supported a double piazza. The walks on the side of that piazza which is opposite to the front of the castle, seem to have been the most spacious and beautiful. At each end of this line are two niches for statues, with their pedestals, borders, supporters, and canopies, carved with the utmost propriety and elegance. The space within this inclosure, which is now filled with about thirty of the dirty huts of the inhabitants, seems to have been an open court, in the middle of which stood the temple, encompassed with another row of pillars of a different order, and much taller, being 50 feet high; but of these, sixteen only remain. The whole space contained within these pillars is 59 yards in length, and near 28 in breadth. The temple is no more than 33 yards in length, and 13 or 14 in breadth.

The temple points north and south; and, exactly opposite the middle of the building, on the west side, is a most magnificent arch, on the remains of which are some vines and clusters of grapes, carved in the most bold and masterly imitation of nature that can be conceived. Just over the door are discerned a pair of wings, which extend its whole breadth: the body to which they belonged is totally destroyed; and it cannot now certainly be known whether it was that of an eagle or a cherub, several representations of both being visible on other fragments of the building. It is observed of the windows of this building, which were not large, that they were narrower at the top than below. The north end of the building is adorned with the most curious fret-work and bas-relief; and in the middle there is a dome or cupola, about ten feet diameter, which appears to have been either hewn out of the rock, or moulded to some composition which, by time, is grown equally hard.

North of this place is an obelisk, consisting of seven large stones, besides its capital and the wreathed work about it. It is about 50 feet high; and, just above the pedestal, is 12 feet in circumference. There was probably a statue upon it, which the Turks, in their zeal against idolatry, destroyed. At about the distance of a quarter of a mile from this pillar, to the east and west, are two others, besides the fragment of a third; so that

perhaps they were originally a continued row. About a hundred paces from the middle obelisk, straight forward, is a magnificent entry to a piazza, which is 40 feet broad, and more than half a mile in length, inclosed with two rows of marble pillars, 26 feet high, and 8 or 9 feet in compass. Of these there still remain 129; and, by a moderate computation, there could not originally have been less than 560. The upper end of the piazza was shut-in by a row of pillars, standing somewhat closer than those on each side. A little to the left are the ruins of a stately building, which appears to have been a banqueting-house. It is built of better marble, and is finished with yet greater elegance, than the piazza. The pillars which supported it were of one entire stone, which is so strong, that one of them, which is fallen down, has received no injury: it measures 22 feet in length, and in compass 8 feet 9 inches. In the west side of the piazza are several apertures for gates into the court of the palace. Each of these was adorned with four porphyry pillars, not standing in a line with those of the wall, but placed by couples in the front of the gate facing the palace, two on each side. Two of these only remain entire, and but one standing in its place. They are 30 feet long, and 9 in circumference. On the east side of the piazza stands a great number of marble pillars, some perfect, but the greater part mutilated. In one place eleven are ranged together in a square: the space which they inclose is paved with broad flat stones, but there are no remains of a roof. At a little distance are the remains of a small temple, which is also without a roof, and the walls are much defaced. Before the entry, which looks to the south, is a piazza supported by six pillars, two on each side of the door, and one at each end. The pedestals of those in front have been filled with inscriptions both in the Greek and Palmyrene languages, which are become totally illegible.

Among these ruins are many sepulchres: they are ranged on each side of a hollow way, towards the north part of the city, and extend more than a mile. They are all square towers, four or five stories high. But, though they are alike in form, yet they differ greatly in magnitude and splendour. The outside is of common stone; but the floors and partitions of each story are marble. There is a walk across the whole building, just in the middle; and the space on each hand is subdivided into six partitions by thick walls. The space between the partitions is wide enough to receive the largest corpse; and in these niches there are six or seven piled upon one another.

We are indebted for an account of these very magnificent remains of antiquity, partly to some English merchants who visited them in 1678 and 1691, (Phil. Trans. N^o 217, 218, or Lowthorp's Abr. vol. iii.) but chiefly to M. Bouverie and Mr. Dawkins, accompanied by Mr. R. Wood, who travelled thither in 1751. The result of their observations was published in 1753, in the form of an atlas, containing fifty-seven copper plates, admirably executed. From this splendid work, most of our books of travels have copied some picturesque scene, or curious remain. The Gentleman's Magazine, so early as March 1754, gave a representation of the beautiful arch which stands west of the Temple of the Sun. The annexed Engraving, from the same work, presents a General View of the Ruins, including as many objects as we could conveniently place on one quarto page.

Palmyra was visited by Mr. Bruce before his journey into Abyssinia; but, on account of the many publications concerning these celebrated ruins, he has declined saying much concerning them. He informs us, that, before he came in sight of the ruins, he ascended a hill of white gritty stone, in a very narrow winding road, such as is called a pass; but, on getting up to the top, his eyes were struck with the most stupendous sight which, he believes, ever mortal saw. The whole plain below, which is very extensive, was so covered with magnificent buildings, that they

they seemed to touch one another. All of them are finely proportioned, agreeably shaped, and composed of white stones, which at that distance appeared like marble. In taking a draught of these ruins, Mr. Bruce divided the whole into six angular views, for which the situation of the place is very convenient. The columns are all uncovered to the very bases, the ground on which they are built being hard and solid. The views he took were upon large paper; some of the columns being represented a foot long, and some of the figures in the fore-ground of the Temple of the Sun being near four inches. Before he left Palmyra he observed its latitude with a reflecting quadrant of Hadley; but, as the instrument was out of order, he could not determine it exactly. In his opinion, however, $33^{\circ} 58'$ is not far distant from truth. From such observation as he could make on the longitude, he concluded it to be $37^{\circ} 9'$ east from Greenwich. Mr. Wood makes the latitude 34° north. It stands about 50 leagues south-east of Aleppo, as much from Damascus, and 20 leagues west of the Euphrates.

Palmyra was visited so lately as the year 1818, by Wm. Macmichael, M.D. F.R.S. one of Dr. Radcliffe's travelling-fellows for the university of Oxford. He observes, that the ruins continue in a state of surprising preservation, owing partly to the dryness of the climate, but more to the circumstance of there being no other city in the neighbourhood to which the materials can be appropriated. The present village, or rather hamlet, of Arabs, is contained in the great court of the Temple of the Sun, just as it appeared to Mr. Wood seventy years ago, and as shown on our Plate. *Journey from Moscow to Constantinople*; Lond. 1819.

Mr. Wood observes, that, "notwithstanding its magnificence, there is a greater sameness in the architecture of Palmyra than at Rome, Athens, and other great cities, whose ruins evidently point out different ages, as much from the variety of their manner as their different stages of decay; but, except four Ionic half-columns in the Temple of the Sun, and two in one of the mausoleums, the whole architecture of Palmyra is Corinthian, richly ornamented with some very striking beauties, and some as visible faults."

PALMYRA, a post-town of America, and the only port of entry and delivery in the state of Tennessee; so constituted by law of the United States in 1797; situated on the south bank of Cumberland river, twelve miles south-west of Clarksville. Lat. 36.13 . N. lon. 87.56 . W.

PALMYRA, a township of Maine, in the county of Somerset, having 117 inhabitants.—A township of Wayne county, in Pennsylvania, having 336 inhabitants.—A township of Knox county, in the Indiana territory.

PALNAUD, a county or district of Hindoostan, situated on the south side of the Kistnah; about 70 miles in length, and 15 in breadth; between Golconda and the circar of Guutoor. It is a part of the Carnatic. Time-rycotta is the principal place.

PA'LO, a town on the east coast of the island of Leyta. Lat. 11.15 . N. lon. 124.55 . E.

PA'LO, a cape on the coast of Albania: six miles north-west of Durazzo.

PA'LO, a town of Naples, in the province of Bari: three miles west of Bittetto.

PA'LO, a town of Italy, on the sea-coast, defended by a strong castle: thirteen miles west-north-west of Rome.

PALOCZA, a town of Hungary: eleven miles east of Szeben.

PALOMA'R, a town of Spain, in Arragon: twenty-two miles north of Teruel.

PALOMBA'RA, a town of Naples, in Lavora: five miles north-east of Capua.

PALOME'RA, a seaport-town, on the north-east coast of the island of Majorca.

PALOMINO y VELASCO (Don Antonio), a Spanish painter, born in Valencia, in 1653. He studied at Cordova in grammar, philosophy, theology, and jurisprudence.

The elements of his art he acquired of Don Juan de Valdes Seal; and, to acquaint himself with the styles of the different schools, he went to Madrid in 1678. Here he painted the gallery del Cierzo, and pleased the king and the minister; and in 1688 he was made painter to the king. He was overwhelmed with commissions, for many of which he made only the designs; but, whatever was begun and terminated by himself, in fresco or in oil, possessed invention, design, and colour, in the essential, and taste and science in the ornamental, parts.

As a literary man, Palomino may be considered the Vasari of Spain; as copious, as credulous, and as negligent of dates; but eminently useful with the emendations of modern and more accurate biographers. His work is divided into three parts, theoretical, practical, and biographical. The two first bear one title, viz. "El Musco Pictorico y Escala Optica." The third part, distinguished by that of "El Parnasso Espanol Pintoresco Laureada," &c. Madrid, 1724, though perhaps only intended as an appendix to the two former, is by far the most important and interesting.

PALONGO'LA, a town of Congo, on the Lelunda: two miles south of St. Salvador.

PALONGONG', a town of Matamba: seventy miles south-east of St. Maria de Matamba.

PALOR. See POLLIOR.

PA'LOS, a reef in the Straits of Macassar, near the west coast of Celebes. Lat. 0.24 . S. lon. 119.15 . E.

PA'LOS, a town on the west coast of the island of Celebes, in a bay to which it gives name. Lat. 0.56 . S. lon. 119.39 . E.

PA'LOS, a seaport-town of Spain, in the province of Seville, at the mouth of the Tinto, where the tide forms a tolerable harbour. In the year 1492, Christopher Columbus sailed from this port, on his first voyage for the discovery of the New World: two miles south of Moguer. Lat. 37.10 . N. lon. 6.58 . W.

PALOTTA, a town of Hungary, with a castle, and fortified with a high wall and a moat: eight miles west-south-west of Stuhl-Weisenburg.

PALOTZA, a town of Hungary, on the river Poprat: 112 miles north-north-west of Zatmar, and fifty-four north of Caschau.

PALOU', or PA'LO, a town of Asiatic Turkey, in the pachalic of Erzerum, situated on the edge of a mountain and the banks of the Euphrates: the population amounts to about 8000 souls, Turks, Armenians, and Kurds. The river here is very rapid; and, from the bad construction of the bridges, made of wood, whole caravans have been swept away after the melting of the snow. The district of Palou is four days' journey in length, and two in breadth. The town is eighty-five miles south-south-west of Erzerum, and sixty north of Diarbekir. Lat. 38.52 . N. lon. 39.40 . E.

PALOU'E, *f.* in botany. See GINNANNIA.

PALPABILITY, *f.* [from *palpable*.] Quality of being perceivable to the touch.—He first found out *palpability* of colours; and, by the delicacy of his touch, could distinguish the different vibrations of the heterogeneous rays of light. *Arbutnot and Pope's Mart. Scrib.*

PALPABLE, *adj.* [*palpable*, Fr. *palpo* and *palpor*, Lat.] Perceptible by the touch:

I see thee yet, in form as *palpable*
As this which now I draw.

Shakespeare.

Darkness must overshadow all his bounds,

Palpable darkness, and blot out three days. Milton.

Gross; coarse; easily detected.—That grosser kind of heathenish idolatry, whereby they worshipped the very works of their own hands, was an absurdity to reason so *palpable*, that the prophet David, comparing idols and idolaters together, maketh almost no odds between them. Hooker.

—Plain; easily perceptible.—They would no longer be content with the invisible monarchy of God, and God dismissed them to the *palpable* dominion of Saul. *Holyday*.

PALPABLENESS,

PAL/PABLENESS, *f.* Quality of being palpable; plainness; grossness.

PAL/PABLY, *adv.* In such a manner as to be perceived by the touch. Grossly; plainly.—Clodius was acquitted by a corrupt jury, that had *palpably* taken shares of money: before they gave up their verdict, they prayed of the senate a guard, that they might do their consciences justice. *Bacon.*

PALPA'TION, *f.* [*palpatio, palpor*, Lat.] The act of feeling.

PALPE'BRÆ, *f.* [Latin.] The eyelids.

PALPE'TER, a town of Candabar, in the Cabulistan: fifty miles east of Ghizni.

To PAL/PITATE, *v. a.* [*palpito*, Lat. *palpiter*, Fr.] To beat as the heart; to flutter; to go *pit-a-pat*.

PALPITA'TION, *f.* Beating or panting: that alteration in the pulse of the heart, upon frights or any other causes, which makes it felt; for a natural uniform pulse goes on without distinction.—Anxiety and *palpitations* of the heart, are a sign of weak fibres. *Arbutnot on Aliments.*—Her bosom heaves with *palpitations* wild. *Thomson.*

PALREDYGUR', a town of Hindoostan, in Palnaud: sixteen miles west-south-west of Timerycottia.

PAL'SCHOV, a town of Prussia, in the province of Pomerelia: eleven miles north-west of Marienburg.

PAL'SGRAVE, *f.* A term used among the Germans, of the same import with *palatine*. It is compounded of the Latin *palatium*, and the Dutch *grave*, governor; *q. d.* governor or superintendent of a prince's palace.

PAL'SGRAVE (John), a learned English writer, who flourished in the reigns of Henry VII. and Henry VIII. He received his grammatical learning in London, where he was born. He studied logic and philosophy at Cambridge, at which university he resided till he had attained the degree of bachelor of arts; after which he went to Paris, where he spent several years in the study of philosophical and other learning, took the degree of master of arts, and acquired such excellence in the French tongue, that in 1514, when a treaty of marriage was negotiated between Louis XII. king of France, and the princess Mary, sister of king Henry VIII. of England, Mr. Palsgrave was chosen to be her tutor in that language. But, Louis XII. dying almost immediately after his marriage, Palsgrave attended his fair pupil back to England, where he taught the French language to many of the young nobility, obtained good church-preferment, and was appointed by the king one of his chaplains in ordinary. In the year 1531, he settled at Oxford for some time; and the next year was incorporated master of arts in that university, as he had before been in that of Paris, and a few days after was admitted to the degree of bachelor of divinity. At this time he was highly esteemed for his learning; and, what is very remarkable, though an Englishman, he was the first author who reduced the French tongue under grammatical rules, or that had attempted to fix it to any kind of standard. This he undertook, and executed with great ingenuity and success, in a large work, entitled *Ecclaircissement de la Langue Française*, folio, Lond. 1530. to which he has prefixed a large introduction in English. He also translated into the English a Latin play, written by one Will. Fullonius (an author then living at Hagen, in Holland), entitled *Acolastus*, a comedy, 4to. 1540. When Mr. Palsgrave was born, or to what age he lived, are particulars which we have not been able to trace; yet, from the concurrence of various facts, we cannot suppose him to have been much less than sixty years of age at the time of his publishing the above-mentioned translation.

PALSGRE'BEN, a town of Prussia, in the province of Oberland: five miles south of Osterrod.

PAL'SICAL, *adj.* [from *palsy*.] Afflicted with the palsy; paralytic.

PAL'SIED, *adj.* Diseased with the palsy.—Though she breathes yet in a few pious peaceful souls, yet, like a

VOL. XVIII. No. 1244.

palsied person, she scarce moves a limb. *Decay of Chr. Piety.*

Let not old age long stretch his *palsy'd* hand;
Those who give late are importun'd each day. *Gay.*

PAL'SY, *f.* *paralysis*, Lat. thence *paralyse*, *paraly*, *palasy*, *palsy*.] A privation of motion or feeling, or both, proceeding from some cause below the cerebellum, joined with a coldness, flaccidity, and at last wasting of the parts. If this privation be in all the lower extremities, it is called a *paraplegia*; if in one side only, a *hemiplegia*; if in some parts only of one side, a *parefis*.—There is a threefold division of a *palsy*; a privation of motion, sensation remaining; a privation of sensation, motion remaining; and lastly, a privation of both together. *Quincy.*—A *palsy* may as well shake an oak, as shake the delight of conscience. *South.*

We shall speak very briefly of the three different kinds or species of palsy, as we must in some degree go over the same ground in the article **PATHOLOGY**.

1. **HEMIPLEGIA**.—The palsy which is most frequently seen, and which consists in the loss or diminution of the power of motion of one side of the body, is sometimes the consequence of an attack of apoplexy, where that has not proved fatal; but it more commonly occurs instantaneously, and without any actual apoplectic attack. In the latter case, however, the disease differs from the former only in the degree of injury which has taken place in the brain, the pressure upon that organ being more partial than in apoplexy.

The symptoms of hemiplegia are distinct and obvious, and scarcely liable to be confounded with those of any other disease. The most manifest symptom is the want of command over the limbs of the side affected, which either remain totally immovable by the will of the patient, or are possessed of so little power, that the arm hangs dangling by the side, and the leg is dragged along the ground, rather than elevated, in attempting to walk, and vibrates from want of firmness whenever the foot is planted on the ground. At the same time, the limbs are perfectly flexible by any external impulse, to which they offer no resistance. As the muscles of one side of the head are also paralysed, the features, especially the mouth, are commonly drawn away, giving a distorted appearance to the countenance; for, as the paralysed muscles offer no resistance, so the constant tendency to contraction in the healthy muscles of the opposite side necessarily operates in drawing the whole towards themselves. The face is contracted, therefore, not on the palsied, but on the sound, side. The same palsied condition exists also in one-half of the tongue, which, if it be attempted to be protruded, is shown in a curved state, the point always turning towards the angle of the mouth on the paralytic side. This palsied state of the tongue and lips, and other organs subservient to the voice, is necessarily the cause of indistinct articulation; so that various degrees of defect of speech accompany *hemiplegia*. From the morbid state of the brain, which gives rise to palsy, the functions of the mind are frequently more or less injured; the memory especially is liable to be impaired, and, in many cases, every faculty is so debilitated, that a considerable degree of fatuity or childish imbecility is the consequence. Indeed, there are perhaps few instances, in which the intellectual functions escape entirely unimpaired from an attack of hemiplegia: so that, where the stroke of palsy has been severe, few persons are left in a condition fitted for the active and important duties of life.

The prognosis is generally unfavourable in hemiplegia, more especially when the patient is advanced in life, or debilitated in constitution, or has been in habits of intemperance. For, under such circumstances, the system seldom recovers its powers; and the patient remains enervated both in mind and body, and generally incapable of

the ordinary business of life. If, as the disease continues, the paralysed limbs gradually lose their sense of feeling, or if they are affected with coldness, and the flesh wastes, the prospect is most unfavourable. But, if there is a frequent prickling sensation, or even some degree of pain, in the parts; if they are occasionally affected with flushings of heat, or with spasmodic twitchings; or if rheumatic or inflammatory swelling take place in them; these appearances are to be deemed favourable, inasmuch as they imply a less-complete interruption of the nervous power, or its returning influence.

The treatment of hemiplegia will necessarily be somewhat different in different instances, according to the age and constitution of the patient, and to the obvious exciting cause of the disease. It is a practice, but too generally adopted by routine-practitioners, to begin immediately with the exhibition of strong stimulants, upon the superficial inference, it should seem, of a torpor of the nervous power. But, if they were to penetrate a little below the surface of things, it would be evident that this torpor of the nerves depends entirely upon an oppressed state of their origin, the brain, in consequence of an over-action and turgescence of its vessels; and, therefore, that every measure, which tends to augment vascular action, must necessarily be a source of aggravation to the disease. Upon the plainest principles, the very opposite object is to be pursued; and, until the symptoms of plethora and the active state of the disease be subdued, the beneficial aid of stimulants is more than problematical. In a word, it appears, that *stimulants are perhaps never advisable in true hemiplegia*; and that the benefit of these remedies is limited to those species of general palsy which arise from the influence of cold or narcotic poisons on the brain and nerves, or to those local varieties of palsy which seem to depend upon disease affecting the branches and extremities of the nerves, while the brain remains uninjured. For the purposes, therefore, of aiding recovery from an attack of hemiplegia, the principal indication will be, to avoid every species of intemperance; to restrict the diet to light and cooling articles, and to take these with great moderation; to employ regular, but always gentle, exercise, avoiding every extraordinary hurry of the circulation; to preserve a regular, and rather free, state of the bowels; and to manage the clothing so as to preserve a regular state of the cutaneous exhalation, and to avoid the impressions of vicissitudes of heat and cold. In a word, the object will be to free the constitution from all embarrassment, in which condition it will be the best enabled to resume its healthy actions. We may liberate and assist, but we cannot command, the powers of the *vis medicatrix naturæ*. It may be observed, however, that where the attack has been slight, and the tendency to recovery obvious, the return of power in the paralysed muscles seems to be considerably accelerated by a constant exertion of them, or at least by constant attempts at exertion by directing the volition to them. The advantages of this voluntary exertion are commonly obvious in the more speedy and complete recovery of the motion of the leg, when compared to that of the arm, in persons who have suffered hemiplegia; a circumstance to be ascribed solely to the necessity of using the leg in moving from place to place, while the arm is too commonly hung in a sling, and no attempt is made to employ it.

2. PARAPLEGIA, or Palsy of the lower Extremities.—A palsy of the lower extremities may perhaps sometimes arise from injury or disease in some part of the brain itself; but of this the evidence appears to be imperfect; and, at all events, the occurrence is rare. The ordinary instances of this palsy obviously originate from pressure on some part of the vertebral nerve, or spinal marrow, below which the palsy shows itself, while the parts supplied with nerves, that branch off above the seat of the pressure, continue to possess their power of motion unimpaired.

The paraplegia may occur at all ages, and in either sex, and is always productive of much distress: for, if

the patient be a child, it becomes an object of constant and unavailing anxiety to its parents; and, if an adult, he is rendered perfectly helpless to himself, and useless to all others, which of all possible states is surely the worst.

When this palsy attacks an infant of only a year or two old, the true cause of it is seldom discovered until some time after the effect has taken place, at least by parents and nurses, who know not where to look for it. The child is said to be uncommonly backward in the use of its legs, or it is thought to have received some hurt in its birth. When it affects a child who is old enough to have already walked, and who has been able to walk, the loss of the use of the legs is gradual, though not very slow. He at first complains of being very soon tired; is languid, listless, and unwilling to move much, or at all briskly: in a short time after this he may be observed frequently to trip, and stumble, although there be no impediment in his way; and, whenever he attempts to move briskly, he finds that his legs involuntarily cross each other, by which he is frequently thrown down, and that without stumbling; upon endeavouring to stand still and erect, without support, even for a few minutes, his knees give way, and bend forward. When the distemper is a little farther advanced, it will be found that he cannot, without much difficulty and deliberation, direct either of his feet precisely to any exact point; and, very soon after this, both legs and thighs lose a good deal of their natural sensibility, and become perfectly useless for all the purposes of locomotion.

When the disease occurs in an adult person, its progress is much the same, but rather quicker. He complains also, in the early part of its course, of a sense of numbness in the affected limbs, with transitory tremblings and twitchings, and sometimes of rigors: and he finds, as the bladder and lower portion of the bowels are included in the disease, that the stools pass off unconsciously, and the urine flows without his consent, at the same time that he has a difficulty of emptying the bladder. Ultimately the legs become rigid, the knees and ankles stiff, and the feet extended so that they cannot be placed flat on the ground. The last circumstance is likewise observed in children.

When the back is examined, some proninency or curvature of the spine is always found. The curvature varies in situation, extent, and degree, being in the neck or back, and sometimes, though very rarely, in the upper part of the loins; sometimes comprehending two vertebræ only, sometimes three or more, by which the extent of the cure becomes necessarily more or less; but, whatever may be the number of the vertebræ concerned, or whatever the degree or extent of the curvature, the lower limbs only feel the effect, the arms never being affected. The effect is also different in different subjects: some are rendered totally and absolutely incapable of walking in any manner, or with any help, and that very early in the course of the distemper; others can make a shift to move about with the help of crutches, or by grasping their own thighs with their hands; some can sit in an erect posture, in a chair, without much trouble or fatigue, which others are incapable of, at least for any length of time: some have such a degree of motion in their legs and thighs, as to enable them to turn and move, for their own convenience, in bed; others have not that benefit, and are obliged to lie till moved by another.

The disease is commonly ascribed to some injury, such as a blow, fall, or violent strain, which had affected the spine; and probably this is actually the origin of it in many instances. But there is no doubt that the spine and its ligaments often become diseased, so as to produce paraplegia, independently of such violence. For it is not the mere distortion or curvature of the spine which gives rise to the palsy, (since the most extensive crookedness often occurs where no paralysis exists;) but actual pressure upon the vertebral nerve, by the concomitant disease of the spine.

The cure of paraplegia was seldom effected till the proper

proper treatment was devised by Mr. Pott. While the curvature of the spine remained undiscovered or unattended to, the disease was generally considered as *nervous*, and medicines so called were most frequently prescribed, together with warm liniments, embrocations, and blisters, to the parts affected; and, when the true cause was known, recourse was always had to steel stays, the swing, the screw-chair, and other pieces of machinery, in order to re-form the spine to its true and natural figure. But these expedients did not serve any real or permanent good purpose: the patients usually became unhealthy, and, after languishing for some time under a variety of complaints, died in an exhausted and emaciated state; or, which was still worse, dragged on a miserable existence, confined to a great chair, or bed, totally deprived of the power of moving.

The sagacious mind of that eminent surgeon, Mr. Pott, partly from a consideration of the diseased state of the ligaments and bones, which precedes and occasions the curvature, and partly on the suggestion of a learned physician, Dr. Cameron, of Worcester, (who, in consequence of an observation of Hippocrates, that a paraplegia had been cured by an abscess in the back, had imitated that process with advantage,) devised the plan of instituting a free discharge, by means of a large issue, from both sides of the spine. Experience confirmed the utility of this practice; and many examples of the complete restoration of strength and motion, in these deplorable cases, have been subsequently recorded.

3. PARESIS, or local Palsy.—The partial palsies of this kind are chiefly those which are connected with long-continued rheumatic inflammation, or with the long application of cold, or lastly, with the operation of certain mineral poisons, especially lead and mercury. After a limb has been for some time the seat of inveterate rheumatism, especially in debilitated habits, it sometimes becomes torpid, and benumbed as it were, losing its power of motion, and commonly some degree of its sensibility. A similar condition is more speedily produced by the direct application of cold to the parts; as, for example, in the legs and feet of persons who work with these parts in water. The extremities of the nerves appear to be no longer capable of receiving and conveying the nervous power from the brain, while the latter shows no symptom of any disease. The poison of lead, by whatever means it is introduced into the system, produces a species of palsy peculiar to itself: its first effect is the production of a severe colic, which from its being most frequently seen in painters, has been called the *painter's colic*; and it has received also several other appellations, from certain districts in which it has been prevalent, as the Devonshire colic, colic of Poitou, &c. After one or more attacks of this colic, the patient perceives that one of his hands grows weak, and at length he finds himself altogether unable to extend either the hand or the fingers, which hang down torpid, and moveless except from external force. As this commonly succeeds the attacks of colic, it may be probably connected with irritation in the intestinal canal, which appears at times to produce other forms of partial palsy. The palsy from the influence of mercury is also of a peculiar nature; it seems indeed to be rather an extreme debility of the muscles of the limbs, combined with tremors, than an absolute paralysis.

It is to these varieties of palsy, in which there is no plethora, congestion, or pressure upon the brain, that the employment of *stimulant remedies* alone is properly applicable, and that in fact any benefit is to be expected from them. In the palsy that is occasioned by protracted rheumatism, or by cold, recovery has frequently followed a perseverance in the use of the warm bath, of repeated and continued friction with the flesh-brush, or with various stimulating oils and liniments, of which camphor, turpentine, and the acrid gums, together with alcohol, constitute the principal ingredients. Internally, also, stimulant medicines of a similar nature have been at the same time administered, with a view to aid these effects; es-

pecially the ammoniacal salts, or tinctures of the stimulant gums in alcohol, and medicines which have been supposed to possess peculiar powers of exciting the nervous system, such as the arnica, the rhus toxicodendron, &c. Electricity has also been extensively applied to paralytic limbs under these circumstances; and it is probable, both from its obvious influence in exciting spasmodic twitches in the muscles, and from the number of successful instances of its application which have been recorded, that it has been of material benefit.

We have mentioned, among other stimulants that are really successful in the cure of these species of local palsy, the warm-bath, an expedient which is hazardous, in the early stages at least, of hemiplegia. Hence the Bath waters, and more especially the use of the hot-pump, commonly succeed in removing the palsy from lead, as well as from cold and rheumatism. There is, indeed, no remedy that appears to possess an equal efficacy: in the palsy from lead, after the disease has resisted all ordinary expedients, the hot-pumping seems to be almost a specific. There appears no reason, however, to suppose that any water of the same temperature, poured upon the limb in the same quantity, and with the same impetus, could not equally affect the cure, as the water of Bath; since it is the *quantity* of the stimulation, and not any peculiar quality of the water, that produces the effect.

For the palsy arising from the poison of lead, and affecting principally the extensor muscles of the hand and fingers, Dr. Pemberton recommended a simple contrivance, which appears to have contributed to accelerate the cure of this disease; namely, a sort of battledore of wood, of the length of the fore-arm and hand, which is tied to the former, and supports the latter extended at length. Under this support, he conceives the muscles sooner recover their tone than when they are constantly stretched by the pendulous hand.

Under all the forms of palsy, a constant exercise of the palsied limb contributes materially to expedite its recovery. This principle is equally applicable to the hemiplegia, as to these partial forms of palsy. But to the palsy, or tremors, originating from the poison of mercury, neither this nor any of the preceding precepts very clearly apply. The brain, in this case, seems to be affected by the poison, and the whole system suffers from its deleterious influence. Many remedies have been recommended, but especially sulphur, which was suggested perhaps upon chemical notions, rather than from a proper estimate of its operation upon the living body. On the whole, the disease is very unmanageable, and we know not how it is to be cured. The manufacturers among whom it almost exclusively occurs, viz. watch and button gilders, silverers of mirrors, &c. have contrived mechanical means of preventing the mercury, especially when used in its most pernicious form, vapour, from entering into the body so fully as formerly; and therefore the disease is become less frequent. But even now, as we are informed, the persons employed in what is called water-gilding, that is, in laying an amalgam of gold and mercury upon the articles to be gilded, and driving off the mercury by evaporation, are generally short-lived from this cause.

PAL'TA, or PALTE'. See JAMPRO, vol. x.

To PALTER, *v. n.* [from *paltron*, or perhaps from *paltry*.] To shift; to dodge; to play tricks. *Not in use.*—As if they hated only the miseries, but not the mischiefs, after they had juggled and *paltered* with the world. *Milton's Ten. of Kings and Magistrates.*

To the young man I must send humble treaties,
And *palter* in the shift of lowness. *Shakespeare.*

Be these juggling fiends no more believ'd,
That *palter* with us in a double sense;
That keep the word of promise to our ear,
And break it to our hope. *Shakespeare's Macbeth.*

Romans, that have spoke the word,
And will not *palter*. *Shakespeare's Jul. Caesar.*

To PA'LTER, *v. a.* To squander.—To be a justice of the peace, as you are, and *palter* out your time i' the penal statutes; to hear the curious tenets controverted between a protestant constable and jesuit cobbler! *Beaumont and Fleet. Elder Brother.*—*Paltering* the free and moneyless power of discipline with a carnal satisfaction by the purse. *Milton's Reas. of Ch. Government.*

PAL'TERCAMP, a town of Westphalia, in the bishopric of Osnabruck: fourteen miles south-south-east of Osnabruck.

PA'LTERER, *f.* An insincere dealer; a shifter.

PAL'TI, [Heb. flight.] A man's name.

PAL'TRINESS, *f.* [from *paltry*.] The state of being paltry.

PA'LTRY, *adj.* [*poltron*, Fr. a scoundrel; *poltrocca*, a low whore, Ital. *Dr. Johnson.*—Rather from the Su. Goth. *paltr*, rags; or Teut. *palt*, a scrap, a fragment. Mr. H. Tooke considers *paltry* as a participle, jointly with *poltron*; that is, formed of the Latin *pollice trunco*, having the thumb cut off. *Div. of Purley*, ii. 25. 26.—After all this learning, and a great deal more which has been poured out by Mr. Todd in his edition of Johnson's Dictionary, there is little doubt that *paltry* is a corruption and contraction of *pauvreté*, Fr. The truly idiomatic French translation of "It is a paltry thing" is undoubtedly *C'est une pauvreté*. "He acted in a paltry manner;" *Il a fait des pauvretés*. "He had but a paltry shop;" *Il n'a qu'une pauvre boutique*. In short, the French *pauvre*, in an oblique sense is exactly the same as *paltry* in English. *MIS. Gleanings in Etymology.*] Sorry; worthless; despicable; contemptible; mean.—A very dishonest *paltry* boy, as appears in leaving his friend here in necessity, and denying him. *Shakespeare.*

Then turn your forces from this *paltry* siege,
And stir them up against a mightier talk. *Shakespeare.*

Whose compost is *paltry*, and carried too late,
Such husbandry useth that many do hate. *Tusser.*

When such *paltry* slaves presume
To mix in treason, if the plot succeeds;
They're thrown neglected by; but, if it fails,
They're sure to die like dogs. *Addison's Cato.*

PALTZ (New), a town of the States of New-York: thirteen miles south of Stockport.

PALVARY'A, a town of Hindoostan, in Oude: thirty-two miles east of Kairahad.

PALUD' (La), a town of France, in the department of the Drôme: twelve miles north-north-west of Orange, and five south of Montelimart.

PALUDAMENTUM, *f.* among the ancients, a garment worn in time of war by the principal men of Rome, especially the generals, who were called for that reason *paludati*. The soldiers, having only short coats, called *sagum*, were denominated *sagati*.

The *paludamentum* was open on the sides, coming down no lower than the navel, and had short sleeves. It was white, purple, or red, and sometimes black. Valerius Maximus remarks, it was an ill omen to Crassus, that they gave him a black *paludamentum*: "Pullum ei traditum est *paludamentum*, cum in prælium euntibus album, aut purpureum, dari solet." Cornutus says, the Romans wore the toga in peace, and the *paludamentum* in war. And hence the phrase "Togam *paludamento* mutavit." Kennett says, the old *paludamentum* of the generals was all scarlet, only bordered with purple; and the *eklamys* of the emperors was all purple, commonly beautified with a golden or embroidered border. See CHLAMYS, vol. iv.

PALUDA'NUS (John), vernacularly *Vanden Broeck*, a learned Flemish divine and theological professor, was a native of Mechlin, where he was born in the year 1566. He was educated at the university of Louvain, where, after completing his philosophical course, he took the degree of M.A. in 1585. Afterwards he assiduously studied divinity and sacred criticism, under the instructions of the very-celebrated Michael Baius. During several years

he filled the chair of professor of eloquence at Falcon-college, and officiated at the same time as parish-priest of St. Gertrude in that city. Afterwards he became incumbent of the church of our Lady at Mechlin; whence he removed, in 1602, to the living of St. Peter and St. Paul in the same place. In the same year he was created doctor of divinity. In 1610 he returned to Louvain, where he was appointed canon and pastor of St. Peter's, and nominated, at first professor in ordinary of divinity, and afterwards professor-royal of sacred literature. He was also made archpriest of the district of Louvain. He died in 1630, in the sixty-fifth year of his age. He was the author of several works which are highly valued by zealous Catholics; among which are, 1. *Vindiciæ Theologicæ, adversus Verbi Dei Corruptelas*; 1620 and 1622, 2 vols. 8vo. consisting of an explication of almost all the texts of scripture quoted by Protestants in refutation of the doctrines of the church of Rome, according to the order of the books in the Bible. 2. *Apologeticus Marianus*, 1623, 4to. in praise of the Virgin Mary, and attempting, by arguments drawn from the fathers, to establish her claim to the prerogatives which the Catholics ascribe to her. 3. *De Sancto Ignatio Concio Sacra*, 1623, 8vo. 4. *Officina Spiritualis sacris Concionibus adaptata*, 1624, 4to. *Valerii Andreae Bibl. Belg.*

PALUDAPIUM, *f.* in botany. See APIUM.

PALUDE, a town of Turkish Armenia, in the government of Erzerum; the residence of a prince in some respects independent of the grand signior. Lat. 38. 35. N. lon. 39. 14. E.

PALUDIFEROUS, *adj.* [from the Lat. *palus*, a marsh, and *fero*, to bear.] Producing marshes. *Cole.*

PALVERE'TO, a town of Naples, in Calabria Citra: ten miles east-north-east of Cosenza.

PALUM'BINE, *adj.* [from *palumbus*.] Belonging to a beautiful kind of pigeon, the ringdove.

PALUM'BUS, *f.* The ringdove, a beautiful species of pigeon. See COLUMBA *palumbus*, vol. iv. p. 818.

PA'LUS, *f.* A military exercise among the Romans, by which the young men prepared and qualified themselves for real combat. The *palus* was a pillar, about six feet high, fastened into the ground: against this the soldiers made an attack, assailing it in several different modes and attitudes; always taking care so to manage their weapons, that, supposing it was a real enemy, they might not expose any part of their body to be hurt, while they were striking their adversary. Instead of a sword, they used a rod or stick. They likewise ran at the *palus* with lances, and threw javelins and darts at it, endeavouring to hit particular parts; and their success was a proof of their dexterity.

PA'LUS MÆO'TIS. See SEA of AZOF, vol. ii.

PAL'WAL, a town of Hindoostan: thirty-five miles south of Delhi.

PAL'Y, *adj.* [from *pale*.] Pale. *Used only in poetry.*

Fain would I go to chafe his *paly* lips,
With twenty thousand kisses. *Shakespeare.*

A dim gleam the *paly* lanthorn throws
O'er the mid pavement. *Gay.*

PA'LY, *adj.* in heraldry, is when an escutcheon is divided into six, eight, or ten divisions, pale-wise, i. e. by perpendicular lines drawn from the top to the bottom.

PALY-BENDY is when the field is divided by perpendicular lines, which is called *paly*; and then, again, by diagonals crossing the former, from the dexter side to the sinister, which is the *bendy*.

PAM, *f.* [probably from *palm*, victory; as *trump* from *triumph*.] The knave of clubs:

Ev'n mighty *pam*, that kings and queens o'erthrew,
And mow'd down armies in the fights of loo. *Pope.*

Our "Etymological Gleaner" goes higher for the derivation of this word: Pamphilus, Lat. *παραφίλος*, Gr. "one who loves every thing," which *pam* may be supposed

posed to do, since he seizes upon all.—An Athenian named *Pamphilus* having robbed the public treasury, gave occasion to the Latin adage *Pamphilus portum*. This strongly alludes to the mighty catchings of *Pam* at cards. *MS. Gleanings*.

PAM'ADA, a town of Birmah, on the Ava: twenty-four miles north of Prone.

PAMAKAS'SAN, a town on the north coast of the island of Madura.

PAMALANG', a town on the north coast of the island of Java. Lat. 6.45. S. lon. 109. 28. E.

PAMANAKAN' POINT, a cape on the north coast of the island of Java. Lat. 6. 12. S. lon. 107. 54. E.

PAMANDOO'R, a town of Hindoostan, on the coast of Tinevelly: ten miles north of Tutacorin.

PAMBAMA'CA, a mountain of South America, in the province of Quito.

PAMBOU'K, the Turkish name of the ruined city of Hierapolis. See *HiERAPOLIS*.

PAMBU', a town of Thibet: twenty miles east of Tankia.

PAM'BUK-KAL'ASI. See *BAMBUK-KALASI*, vol. ii.

PAME'A, *f.* in botany. See *TERMINALIA*.

PAMELE, or **PAMELAN'**, a town of the kingdom of the Netherlands, on the Dender: seven miles south of Aloft.

PAME'LIUS (James), a learned Flemish divine; was the son of Adolphus, baron de Pamela, counsellor of state to the emperor Charles V. and born at Bruges in the year 1536. He pursued his academical studies at Louvain, where he spent nine years in successfully cultivating an acquaintance with the different branches of learning, and particularly sacred literature. Afterwards he went for further improvement to the university of Paris, and visited others of the most celebrated seminaries in Europe. Upon his return to Louvain, he was admitted licentiate in divinity, and preferred, through the interest of his family, to a canonry at Bruges. He now expended considerable sums of money on the collection of a good library, and particularly on the purchase of manuscript copies of the writings of the fathers, by which their edited works might be amended and illustrated, and inedited pieces be presented to the public. To the use which he made of them, and his ability as a divine and critic, his works, mentioned below, bear honourable testimony. But, while he was thus employed, the civil wars in the Netherlands compelled him to retire from Bruges to St. Omer's, where the bishop made him archdeacon of his church. Soon afterwards Philip II. king of Spain, nominated him provost of St. Saviour's at Utrecht; which preferment was followed by his promotion to the vacant see of St. Omer's. While he was on his journey, however, to take possession of this dignity, he fell sick at Mons in Hainault, where he died in 1587, when he was in the fifty-second year of his age. He published, 1. B. Cypriani Opera omnia, à Codd. Manusc. accuratissimè recog. Annotationibus sparsim insertis, præmissaque Auctoris Vita; Ant. 1568 and 1589, Paris 1574, folio. 2. Tertulliani Opera, è MSS. Codd. auct. ac recens. Argumentis et Annotationibus interject. cum Tertulliani Vita et Paradoxis, &c. printed at Paris after his death, 1598, folio. 3. He prepared for the press a new edition of the Works of Rabanus Maurus, which was published at Cologne in 1626, in five volumes folio, accompanied with his own Commentaries on the book of Judith, and the Epistle of St. Paul to Philemon. 4. Liturgica Latinorum, a curious and scarce work, published at Cologne, in 1571, in two volumes 4to. 5. Micrologus de ecclesiasticis Observationibus. 6. Catalogus Commentariorum veterem seclorum in universa Biblia, 1566, 8vo. 7. Notes on the treatise of Cassiodorus De divinis Nominibus; &c. *Valerii Andreae Bibl. Belg.*

PAME'NE, a town of the island of Ceylon, on the east coast: fifty-five miles south of Trincoli.

PAM'ER, a lake of Prussia: twelve miles west of Lick. VOL. XVIII. No. 1244.

PAMI'ERS, a town of France, and seat of a tribunal, in the department of the Arriège. Near it is a medicinal spring: twelve miles west of Mirepoix, and fourteen north of Tarascon. Lat. 43. 6. N. lon. 1. 41. E.

PAM'ISUS, in ancient geography, a river of Messenia, which had its source in the mountains that lay towards the north between Messenia and Arcadia, ran north-east, and discharged itself into the sea at the extremity of the Messenian gulf.—Also, a river of Greece, in Thessaly.—Also, a river of Lower Mœsia, in the environs of Odessus, called by Ptolemy *Panyfus*, and placed between Odessus and Mesambria.

PAM'LICO, or **TAR RIVER**, a river of North Carolina, which empties itself into a large bay of the Atlantic called Pamlico Sound; the mouth of the river is in lat. 35. 25. N. lon. 76. 42. W.

PAM'LICO SOUND, a large bay on the coast of North Carolina: a long narrow strip of land separates it from the main sea, about forty miles square: towards the north it communicates with Albemarle Sound.

PAMME'LIA, [from the Gr. *παν*, all, and *μελος*, melody.] The title given to the first collection of canons, rounds, and catches, that was printed in England. The full title of these ingenious and exhilarating effusions is curious, and runs thus: "Pammelia; Musick's Miscellanie, or mixed varietie of pleasant Roundelays and delightful Catches of 3, 4, 5, 6, 7, 8, 9, 10, parts in one: None so ordinarie as musical, none so musical as not to all very pleasing and acceptable. London, printed by William Barley for R. B. and H. W. and are to be sold at the Spread Eagle at the north doore of Paules;" 4to. 1609. The names of none of the composers of these epigrammatic and pointed effusions have been preserved; but many of them seem of great antiquity, which is discoverable both by the words and style of composition. Great musical science is manifested in the canons, and the harmony and contrivance of the rest are excellent. The words, indeed, except those of the canons, which consist of small portions of the Psalms, and other parts of Scripture; in Latin, (which seems to imply that they were set before the Reformation,) are, in general, devoid of wit, humour, poetry, or common sense. Our lyric poetry, during the 16th and part of the 17th century, was in a barbarous state, and far inferior to the music of the times: but the composers seemed so little solicitous about the words they had to set, as frequently to prefer the syllables of solmisation *Ut re mi fa sol la, Hey down down derry down*, or merely *Fa la*, to songs of Spenser and Shakespeare. In the same year was published another collection, entitled "Deuteromelia, or the Second Part of Musick's Melodie, or Melodious Musicke of Pleasant Roundelaies, &c. London, printed for Thomas Adams, dwelling in Paules Church-yard, at the sign of the White Lyon, 1609." This publication is much inferior to the preceding; and chiefly consists of songs for three voices, in which different stanzas are sung to the same music, after the manner of what are called glees.

PAM'MENOCKE POINT, a cape on the north coast of New Guinea. Lat. 0. 24. S. lon. 133. 21. E.

PAM'MIN, a town of Brandenburg, in the New Mark: two miles south of Reetz.

PAMNAGUR', a town of Hindoostan, in the circar of Kitchwara: thirteen miles north-west of Burdwar.

PAMOACAN', a town of the island of Borneo, on the east coast, near the south part of the island: 150 miles north-east of Banjer Massim.

PAMODUR'SE, a town of Hindoostan, in Mysore: twenty miles south of Tademer.

PAMO'NA. See *POMONA*.

PAMPANGAN', a town of the island of Luçon, capital of a province, populous and extensive; the inhabitants in general have adopted the religion and manners of the Spaniards. The town is situated on the east coast. Lat. 15. 5. N.

PAM'PA HERMO'SA, a town of Peru, in the diocese

cese of Truxillo, and province of Pataz, on the west bank of the Guallaga, inhabited by Indians.

PAMPA'RA, a town of Africa, in Bambarra: 156 miles west of Segó.

PAMPAS, a province of South America, in the vice-royalty of Buenos-Ayres, consisting of vast plains, which extend from the sea-coast on the east, to that great chain which forms the beginning of the Cordilleras of Chili, about 140 leagues west from the city of Buenos-Ayres. Towards the south, they stretch about 100 leagues to a chain proceeding west-north-west from the Atlantic. The northern boundaries are not distinctly known, but the name of Pampas is chiefly applied to the territory on the south of Buenos-Ayres, Cordova, and Mendoza. These vast plains, like the Steppes of Russia, having scarcely any elevations: the view, as at sea, is terminated by the horizon. They are only diversified with paths and ditches, which collect the rain-waters, and which commonly end in lakes, as there is no declivity; yet there are wide tracts in which no water is found, nor is that element pure; and trees are extremely rare, except a few shrubs round the lakes. Hence this region is only inhabited by a few wandering savages. The soil is generally a black earth, of little depth, and is followed by a kind of coarse white chalk, so that it is difficult to form wells, as the water can scarcely pass so tenacious a substance. The chief pasturage is clover, and, in the best parts, sometimes so strong, as to resist the step of a horse: it is much liked by the cattle, which, when there is water, multiply prodigiously in the Pampas.

PAMPAS DEL SACRAMENTO, immense plains in Peru, lying between the Gualaga and the Marañon west and east, bounded by the Tunguragua on the north. The names Montana Real and Pampas del Sacramento have been confounded; whereas the former, in its strict original acceptation, implied a mountainous region of no great extent, to the east of the provinces of Tarma and Guanuco; whilst the latter has been carried to an immense extent, so as to include the vast territories on the north and south of the Marañon, as far as the line of demarcation with the Portuguese settlements. In this acceptation, the medial length from the country of the Majos, lat. 15. S. to the river Guaviari, lat. 3. N. is 180, or 1080 geographical miles. The breadth depends upon the Portuguese frontier, but the medium may be 100, or 600 geographical miles.

The name of *Pampas del Sacramento*, Plains or Steppes of the Holy Sacrament, was imposed by the pious fathers on an enormous territory, watered by the Ucayal, or genuine Marañon, and which they fondly represent as being as large as Europe; but they deserve greater credit when they inform us, that it is about 8000 leagues square, and capable of maintaining five millions of inhabitants. The recent discovery of the Pampas is chiefly owing to father Girval, who has navigated about 400 leagues south to north, and seventy west to east, on the grand and genuine Marañon, and has inspected and described the country with considerable care. He has discovered twenty-five nations, or rather tribes of Indians, of whom he pretends to have converted four, viz. the Panos, Cambos, Chipeos, and the Piros. The common deity of all the tribes he found to be the Moon; and they dread a demon called Nugi, whom they regard as the author of all their calamities. For the conducting of their wars, they elect a chief of the greatest courage and cunning; and, in the prosecution of their contests, the men are slain, and women and children only become captives. Some tribes are more courteous and humane; while others, as the Cafivos and Carapachos, are anthropophagi. The Carapachos are about 80° south lat. on the bank of the river Pachitea; and the Chipeos at 7. 35. Among all the nations on this part of the genuine Marañon, circumcision is practised among the men, and excision among the women. The Capanaguas, a tribe on the river Mague, dress and eat their dead, and

think this action meritorious; and yet they are one of the most humane tribes.

The Pampas del Sacramento are divided from the Sierra, or the hills of Peru, by a lofty chain, from which this vast country appears so level that it resembles the ocean. The perpetual verdure of its fields forms a delicious perspective; and for some hours in the day there is so thick a fog on the tall trees, that the clouds seem to be under your feet. Rain and thunder are frequent. Insects and reptiles are abundant. Many of the vegetable products are rare and singular. Balsams, oils, gums, resins, incense, cinnamon, though inferior to that of Ceylon, cacao, cascarilla, and an excellent spice, called the pucherí, are very plentiful. But the warmth and humidity render a country, equal in size to an Asiatic empire, almost uninhabitable; and even the few traders on the banks of the rivers rarely see a man of the age of fifty. Yet the missionaries have founded several villages. New entrances have been found to the Montana Reale, Pampas, or rather great territory of Colonna, since the late missions were established. *Pinkerton's Geography*, vol. iii.

PAM'PEL, a town of the duchy of Courland: twenty-four miles south of Goldingen.

PAMPELLON'NE, a town of France, in the department of the Tarn: twelve miles north of Alby, and twenty-one north-east of Gaillac.

PAMPELU'NA. See PAMPLONA.

To PAMPER, *v. a.* [from the Lat. *pampinus*, a young vine-branch, full of leaves, *pampre*, Fr. A vineyard is said by the French *pamprer*, when it is overgrown with superfluous leaves and fruitless branches. *Junius*.] To glut; to fill with food; to feed luxuriously.—The goat, being fond of *pampering* upon the new shoots and leaves of the vine, was deservedly brought to the altar of Bacchus as a devoted victim for injuring a plant so dear to that god. Hence to eat with an avidity similar to that of the goat who feeds and fattens upon the *pampinus*, has been expressed not inelegantly by the verb to *pamper*. *MS. Gleanings*.

You are more intemperate in your blood
Than Venus, or those *pampered* animals
That rage in savage sensuality.

Shakespeare.

His lordship lolls within at ease,
Pam'ring his paunch with foreign rarities.

Dryden.

To *pamper'd* insolence devoted fall
Pride of the flock and choicest of the stall.

Pope.

PAM'PERED, *adj.* Over full:

Fruit-trees over-woody reach'd too far
Their *pamper'd* boughs.

Milton's P. L.

PAMPERER, *f.* One that pampers.

PAMPERING, *f.* Luxuriancy.—It is an encouragement to security, and a *pampering* in sin. *Fulke against Allen*.

PAMPHAR'MACON, or rather PANPHARMACON, *f.* [from the Gr. *παν*, all, and *φαρμακον*, a remedy.] A remedy against all manner of poisons.

PAMPHE'LIS, in ancient geography, a town of Asia Minor, on the confines of Pamphylia, near a mountain called Climon. Strabo says, that it was a considerable town, and that it had three ports and a lake.

PAM'PHILUS, a celebrated painter of Macedonia, in the age of Philip. He was founder of the school for painting at Sicyon; and he made a law, which was observed not only in Sicyon, but all over Greece, that none but the children of noble and dignified persons should be permitted to learn painting. See the article PAINTING, p. 210 of this volume. Apelles was one of his pupils.

PAM'PHILUS, an excellent presbyter of Cæsarea in Palestine, and a martyr under the persecution of Maximinus, in the early part of the fourth century, is generally believed to have been a native of Berytus in Phœnicia, and a descendant from a good and wealthy family.

After

After having received the rudiments of learning at his native city, he went to Alexandria in Egypt, where he completed his studies, and then settled at Cæsarea. Here he entered into an intimate friendship with Eusebius, bishop of the place, who has given many testimonies of his sincere respect for the memory of his friend. According to Cave, Pamphilus flourished about the year 294. He was possessed of such zeal for the interests of religion and sacred literature, that he founded, at a great expense, a library at Cæsarea, which contained all the most celebrated writers of the church, collected from all quarters; and is compared by Jerome with the more ancient celebrated libraries of Demetrius Phalereus and Pisistratus. He even wrote out with his own hand the greatest part of Origen's works, which were in the library in Jerome's time; and that father obtained possession of five and twenty volumes of Origen's Commentary upon the Twelve Prophets, written by Pamphilus, which, he said, he valued as much as if he had the treasures of Cræsus. There are still extant in the curious collections of Europe memorials of this library of Pamphilus, and traces of his and Eusebius's labour in transcribing or correcting copies of the scriptures, or other books, to which the reader may find references in Lardner. Pamphilus was jointly concerned with Eusebius, in publishing a correct edition of the Greek version of the Seventy from Origen's Hexapla; which Huet believes to have been the first separate edition of that version according to Origen's emendations. He was also jointly concerned with Eusebius, in writing five books of "An Apology for Origen," to which Eusebius, after his death, added a sixth. Of this work the first book is still remaining, in Rufinus's Latin translation; and there are some fragments of the rest preserved in Photius's Codex.

In the year 307 when the persecution raged against the Christians, Pamphilus was apprehended, and carried before Urbanus, the Roman president at Cæsarea, who, after trying his knowledge by different questions in rhetoric, philosophy, and polite literature, required him to offer sacrifice. When he found that Pamphilus refused to obey him, and despised all his threatenings he commanded that he should be tortured with the utmost severity, and then committed to prison. In the year 309, after having several times resisted the cruel efforts of his persecutors to overcome his constancy, he was put to death by the orders of Firmilianus, who had succeeded Urbanus in the presidency of the city. Eusebius says of him, that he was the great glory of the church of Cæsarea, and, on account of his eminent virtue, the most renowned martyr of that age: a man who, throughout his whole life, excelled in every virtue; in contempt and renunciation of this world, in liberality to the indigent, in disregard of all earthly honours and preferments to which he might have inspired, and in an abstemious philosophical course of life; but he was especially eminent and remarkable above all men of our time for an unfeigned zeal for the holy scriptures, and for unwearied application in whatever he undertook; whether it were kind offices to his friends, or to others who sought his aid." *Eusebii Hist. Eccl. lib. vii. viii. Cave's Hist. Lit. vol. i. Lardner's Cred. vol. v. Gen. Biog.*

PAMPHLET, *f.* [*par un filet*, Fr. Dr. Johnson.—Skinner derives it from the Belgic *pamptier*, a little paper. Mr. Pegge considers it to be from the Fr. *palme-feuillet*, a leaf to be held in the hand; a book being a thing of greater weight. *Anonym. i. 26.*—Caxton, as Dr. Johnson has observed, writes it *pamflet*; but *pamflet* was also an old way of writing it: "Begynnynge with small storyes and *pamfletes*, and so to others." Prol. to K. Apolyne of Thyre, 1510. *Todd.*] A small book; properly a book sold unbound, and only stitched; written or printed.—He could not, without some tax upon himself and his ministers for the not executing the laws, look upon the bold license of some in printing *pamphlets*. *Clarendon.*

Com'st thou with deep premeditated lines,
With written *pamphlets* studiously devis'd? *Shakespeare.*
As when some writer in a public cause,
His pen, to save a sinking nation, draws,
While all is calm his arguments prevail,
Till pow'r, discharging all her stormy bags,
Flutters the feeble *pamphlet* into rags. *Swift.*

A little book, printed in the year 1715, which bears for title "*Icon Libellorum*, or a Critical History of Pamphlets," affords some curious information; and, as this is rather a pamphlet than a book reading age, we shall make a few extracts.

The author is at once serious and humorous in his preface. He there observes, "from pamphlets may be learned the genius of the age, the debates of the learned, the follies of the ignorant, the *bévue*s of government, and the mistakes of courtiers. Pamphlets furnish beaux with their airs, coquets with their charms. Pamphlets are as modish ornaments to gentlewomen's toilets as to gentlemen's pockets; they carry reputation of wit and learning to all that make them their companions; the poor find their account in stall-keeping, and in hawking them; the rich find in them their shortest way to the secrets of church and state. There is scarcely any class of people but may think themselves interested enough to be concerned with what is published in pamphlets, either as to their private instruction, curiosity, and reputation, or to the public advantage and credit; with all which, both ancient and modern pamphlets are too often over familiar and free. In short, with pamphlets the booksellers and stationers adorn the gaiety of shop-gazing. Hence accrues to grocers, apothecaries, and chandlers, good furniture, and supplies for necessary retreats and natural occasions."

This author sketches, with no common learning, the origin and the rise of pamphlets. He deduces them from the short writings published by the Jewish rabbins, various little pieces at the time of the first propagation of Christianity; and notices a certain pamphlet, which was pretended to have been the composition of Jesus Christ, thrown from heaven, and picked up by the archangel Michael, at the entrance of Jerusalem. It was copied by the priest Leora, and sent about from priest to priest, till pope Zachary ventured to pronounce it a forgery! He notices several such extraordinary publications, many of which produced as extraordinary effects. He then proceeds in noticing the first Arian and Popish pamphlets, or rather *libels*, i. e. little books, as he distinguishes them. He relates a curious anecdote respecting the forgeries of the monks. Archbishop Usher detected, in a manuscript of St. Patrick's life, pretended to have been found at Louvain, as an original of a very remote date, several passages taken, with little alteration, from his own writings!

He observes on Sermons; "Tis not much to be questioned but of all modern pamphlets, what or wheresoever, the *English stitched sermons* be the most edifying, useful, and instructive; yet they could not escape the critical Mr. Bayle's sarcasm. He says, *Republique de Lettres*, March, 1710, in his article London, 'We see here sermons swarm daily from the the prefs. Our eyes only behold manna; are you desirous of knowing the reason? It is, that the ministers, being allowed to *read* their sermons in the pulpit, *buy all they meet with*, and take no other trouble than to *read* them, and thus pass for very able scholars at a very cheap rate.'

The ingenious writer now begins more directly the history of pamphlets, which he branches out from four different etymologies. He says, "However foreign the word *pamphlet* may appear, it is a genuine English word, rarely known or adopted in any other language: its pedigree cannot well be traced higher than the latter end of queen Elizabeth's reign. In its first state wretched

must

must have been its appearance, since the great linguist John Minshew, in his *Guide into Tongues*, printed 1617, gives it the most miserable character of which any libel can be capable: Mr. Minshew says, (and his words were quoted by lord-chief-justice Holt,) a pamphlet, that is, *opusculum foliodorum*; 'the diminutive performance of fools;' from *παν*, all, and *πληθω*, I fill; to wit, all places. According to the vulgar saying, all things are full of fools, or foolish things; for such multitudes of pamphlets, unworthy of the very name of libels, being more vile than common shores, and the filth of beggars, and being flying papers daubed over and besmeared with the foames of drunkardes, are tossed far and near into the mouths and hands of scoundrels; neither will the sham oracles of Apollo be esteemed so mercenary as a pamphlet."

Under this first etymological notion of pamphlets may be comprehended the vulgar stories of the Nine Worthies of the World, of the Seven Champions of Christendom, Tom Thumb, Valentine and Orson, &c. as also most of apocryphal lucubrations. The greatest collection of this first sort of pamphlets are the rabbinic traditions in the Talmud, consisting of fourteen volumes in folio, and the popish legends of the Lives of the Saints, which; though not finished, form fifty folio volumes, all which tracts were originally in pamphlet forms.

The second idea of the radix of the word *pamphlet* is, that it takes its derivation from *παν*, all, and *φιλεω*, I love; signifying a thing beloved by all; for a pamphlet, being of a small portable bulk, and of no great price, is adapted to every one's understanding and reading. In this class may be placed all fitched books on serious subjects, the best of which fugitive pieces have been generally preserved and even reprinted in collections of state-tracts, miscellanies, sermons, poems, &c. and on the contrary, bulky volumes have been reduced, for the convenience of the public, into the familiar shapes of pamphlets, fitched *par un filet*, with a thread. Both these methods have been thus censured by the majority of the lower house of convocation 1711. "They have re-published and collected into volumes, pieces written long ago on the side of infidelity. They have re-printed together in the most contracted manner many loose and licentious pieces, in order to their being purchased more cheaply, and dispersed more easily."

The other two branches of etymology are not worth our notice in this place, as we have already given those of Dr. Johnson, &c. The author then proceeds in praise of pamphlets: "The smallness of the size of a book was always its own commendation; as, on the contrary, the largeness of a book is its own disadvantage, as well as terror of learning. In short, a big book is a scare-crow to the head and pocket of the author, student, buyer, and seller, as well as a harbour of ignorance; hence the inaccessible mysteries of the inexpugnable ignorance and superstition of the ancient heathens, degenerate Jews, and of the popish scholasters and canonists, entrenched under the frightful bulk of huge, vast, and innumerable, volumes; such as the great folio that the Jewish rabbins fancied in a dream was given by the angel Raziel to his pupil Adam, containing all the celestial sciences; and the volumes writ by Zoroaster, intitled *The Similitude*, which is said to have taken up more space than 1260 hides of cattle; as also the 25,000, or, as some say, 36,000, volumes, besides 325 lesser MSS. of his. The grossness and multitude of Aristotle and Varro's books were both a prejudice to the authors, and an hindrance to learning, and an occasion of the greatest part of them being lost. The largeness of Plutarch's *Treatises* is a great cause of his being neglected; while Longinus and Epictetus, in their pamphlet *Remains*, are every one's companions. Origen's 6000 volumes (as Epiphanius will have it) were not only the occasion of his venting more numerous errors, but also for the most part of their perdition. Were it not for Euclid's *Elements*, Hypocrates's *Aphorisms*, Justinian's *Institutes*, and Littleton's *Tenures*, in small

pamphlet-volumes, young mathematicians, fresh-water physicians, civilian novices, and *les apprentises en la ley d'Angleterre*, would be at a loss and stand, and total discouragement." *Curiosities of Literature*, vol. ii.

TO PAMPHLET, *v. n.* To write small books.—I put pen to paper, and something I have done, though in a poor pamphleting way. *Howell*.

PAMPHLETEER, *f.* A scribbler of small books.—The squibs are those who in the common phrase are called libellers, lampooners, and *pamphleteers*. *Tatler*.

Small pains can be but little art;
Or load full drie-fats from the forren mart
With folio volumes, two to an ox-hide;
Or else, ye *pamphleteer*, go stand aside. *Bp. Hall's Sat.*

A collection of pamphlets. The title of a periodical work now publishing.

PAMPHOS, a Greek poet, supposed to have lived before Hesiod's age. *Lempriere*.

PAMPHYLA, a Greek woman, who wrote a General History in thirty-three books, in Nero's reign. This history, so much commended by the ancients, is lost.

PAMPHYLIA, in ancient geography, a considerable province of Asia Minor, and which included Pisidia, that occupied the northern part. Pamphylia was bounded on the south by the Mediterranean, and extended along the coast from Mount Climax, which separated it on the west from Caria, as far as the chain of mountains which separated it on the east from Cilicia; to the north it had Phrygia. The principal towns of Pamphylia, commencing westward, were Olbia, at the mouth of the Catactes; Perga (Karahisar) towards the east, at a small distance from thence, on the Cestrus; Aspendus to the south-east, on the Eurymedon; Sede (Cordeloro) directly south, on the sea-coast; Cibyra (Ibuzar) situated to the north-east; Lyrbe to the north-east; and Corybrassus on the Melas. Towards Phrygia were Tormessus (Eftenaz), a principal town of the people called Solymi, and of the small country called Cabalia; Cormosa; Cremna (Kabriacz) to the north-east; Sandalium, a fortress north-west of Cremna; Baris, south-east of Cremna, in which the Romans established a colony; Lyfnoe (Ag-Jafon), east of Cormosa; Trogitis (Egrida), south of a lake, and south-east of Cremna; Oroanda (Haviran), north of the lake; Seleucia Ferrea (Eushar), at some distance east of the lake; and Petnelissus, south-east of Selga and Catenna, upon the Eurymedon, towards the north-east. Ifauria is found within the limits assigned by M. d'Anville to Pamphylia.

PAMPILHO'SA, a town of Portugal, in Estremadura: thirty-four miles north-north-east of Thomar.

PAMPINATION, *f.* [from *pampinus*.] The act of pruning the young shoots of the vine. *Cole*.

PAMPINEAN, *adj.* Belonging to the vine leaf. *Cole*.

PAMPINIFORM, *adj.* [from the Lat. *pampinus*, a vine, and *forma*, a form.] Having the form of a vine-leaf; belonging to a vessel formed by the spermatie veins.

PAMPINUS, *f.* [Latin.] The tender shoot of a vine.

PAMPISFORD, in Domesday **PAMPESWORDE**, now commonly called **PANSAY**, a small village in the hundred of Chilford, and deanery of Camps, and lies about eight miles nearly south of Cambridge, and nine north-east of Royston. When the survey of Domesday was taken, there were two manors in Pampsworth, one of which belonged to the abbot and convent of Ely, having been given to that monastery by duke Brithnoth, in the year 991; the other was held by two knights, whose names are not mentioned, under Alan earl of Britanny and Richmond: the former manor was alienated from the church of Ely, by Hervey the first bishop, and given to his nephew William de Laventon, chaplain to king Henry I. to be held by him under the abbey by knight's service: in the reign of Edward I. it was in the family of Fitz-ancher, or Fitz-anger, afterwards (temp. Ed. III.) in the Shardelowes. The other manor, being held of the

the honour of Richmond, was possessed by sir Henry Brock, temp. Edward I. sir John de Creek, temp. Edward II. Henry Colville, temp. Henry VII. Thomas Marth, 15 James I. It is probable that the two manors had been united previous to the time of James I. as no later mention is found of more than one, which was afterwards in the family of the Parkers, who became possessed of it about the year 1706; and is now, by inheritance, the property of William Parker Hammond, esq.

The church of Pampisford, dedicated to St. John the Baptist, consists of a nave, north aisle, chancel, and south porch. The nave, chancel, and porch, are tiled; the aisle is leaded. At the west end of the nave is a square embattled tower (crowned with a small leaden spire and weathercock) in which are a clock and four bells. The entrance to the church, through the porch, is by a Saxon doorway, within the arch of which is a row of small rudely-executed figures in bas-relief. The nave is separated from the steeple by a pointed arch, from the aisle by four low pointed arches upon three pillars, two of which are octangular, and the remaining one is round. At the west end is a gallery for singers. This part of the church is lighted on the south by four windows. The first window is divided into two lights by a mullion, part of which is broken off. The lower part of the next window is divided by two mullions, which branch off at the top into six divisions; in this window are some small remains of painted glass. The third window consists of two lights at the bottom and four at the top. The fourth window, which is above the one last mentioned, is of later date. In the middle of the nave lies a large blue slab reaved of its brass. The pulpit and reading-desk are fixed in the north-east corner of the nave, the former is octangular and carved. At the south-east corner is an old pew, carved. The nave is separated from the chancel by a pointed arch, at the top of which is a carved head; under the span of the arch, which is closed up, are fixed the Lord's Prayer, Ten Commandments, and the Creed; and under these is a neat wooden screen. You enter the chancel by two folding-doors, painted in imitation of mahogany. The chancel is lighted on the south by two windows, each divided into two lights by one mullion, which branches off at the top into ramifications. The east window is pointed, and consists of three lower and six upper lights. Near the entrance from the nave is a blue slab robbed of its brasses. Against the north wall is an altar-tomb, once ornamented with brass round the edge; on the south side of the tomb are three shields, but so completely bedaubed with that enemy of antiquaries, whitewash, as to be quite unintelligible. On this tomb stands a chest in which the registers have been kept. The ascent to the altar is by three steps; the table is plain oak. In the north wall of the chancel is a round-headed recess, and in the south wall a trefoil-headed piscina. A pedestal in the east wall for an image. The chancel is open to the roof, which is at present in a state of melancholy neglect. The sparrows from an adjoining farmyard have uninterrupted ingress and egress through the broken tiles.

The improper rectory and advowson of the vicarage, which belonged formerly to the nuns of Blackeburgh, to whom it was appropriated in the year 1377, were, after the reformation, successively in the families of Wood and Tyrrell, and are now the property of John Mortlock, esq. of Cambridge; the parish has been inclosed pursuant to an act of parliament, passed in 1799, by which allotments of land were given in lieu of tithes. By the returns made under the act of parliament for ascertaining the population of this kingdom in 1801, it appears that there were in Pampisford 35 inhabited houses, 46 families, 202 persons: in 1811, 49 inhabited houses, 49 families, 237 persons. *Gent. Mag.* March 1815.

PAMPLIEGA, a town of Spain, in Old Castile: twelve miles south-west of Burgos.

PAMPLO'NA, or PAMPOLU'NA, a city of Spain, and

capital of the province of Navarre, partly situated on a little eminence, and partly in a fertile plain, on the banks of the Arga, near the Pyrenees. It is surrounded on all sides by lofty mountains, at the distance of two or three leagues. This city is said to have been built by Pompey, after the defeat of Sertorius, whence it derived the name of *Pompeopolis*. It is a fortified town, and defended by two castles, one in the town and the other contiguous, though without the walls. This last place, which is the citadel, was built by Philip II. it is strong from its situation on a rock; it has five bastions covered with stone, and good fosses; a deep marsh, of considerable extent, renders the approaches to it difficult towards the side on which it could be attacked. This citadel has a handsome tower, several magazines, a square ornamented with trees, and an armory in the centre of the fortrefs, which is round, and opens by five grand and open streets, which lead to the five bastions. Here is a hand-mill of ingenious construction, that would be useful in case of a siege; it is a large machine, composed of several wheels, which turn five grinding-stones, with as many hoppers; 120 loads, or 360 quintals, of wheat, may be ground with it daily: it is turned with the hand, or may be worked by horses. This town boasts of having been the first in Spain which received the light of the gospel; its bishopric, one of the most ancient in Spain, was re-established after the expulsion of the Moors; it is suffragan to Burgos. The chapter of the cathedral comprehends twelve dignitaries, as many canonries, and forty-four prebends and chaplaincies. There is another chapter in the same cathedral. This town is the residence of the viceroy of Navarre. Its population consists of about 2800 families, composed of nearly 14,000 persons, occupying 1632 houses. In this capital of Navarre the states held their sittings. The college for the instruction of youth is an university, founded in 1608. Pampeluna contains a cathedral, three parishes, nine convents of monks, and two of nuns. The city itself is confined and ill-built, but its streets are kept remarkably clean. There are some squares, two of which have tolerably handsome houses, particularly that which is appropriated to bull-fighting. The commerce consists merely of imports, and its manufactures are few and inconsiderable. Those of parchment and of leather, and another of coarse cloth, are of little importance; here also they make common earthenware, and blanch wax, which they import. This city was recovered from the French, by the English and Spanish armies under the duke of Wellington, Oct. 30, 1813. It is seventy-eight miles north-north-west of Saragossa, and 172 north-north-east of Madrid. Lat. 42. 50. N. lon. 1. 46. W.

PAMPLO'NA, or PAMPOLUNA, a town of South America, in the new kingdom of Grenada: 300 miles north-east of Popayan, and 170 north-north-east of Santa Fé de Bogota. Lat. 6. 30. S. lon. 71. 36. W.

PAMPROU, a town of France, in the department of the Two Sevres: nine miles south-east of Saint Maixent.

PAMPUS, a channel between the Zuyder Sea and Amsterdam.

PAMUNKY, a river of Virginia, now called York River.

PAN, *f.* [from panne, Sax. perhaps from *panis*, Lat. bread or cake.] A vessel broad and shallow, in which provisions are dressed or kept.—This were but to leap out of the *pan* into the fire. *Spenser*.

The pliant brass is laid

On anvils, and of heads and limbs are made,
Pans, cans.

Dryden.

The part of the lock of the gun that holds the powder.—Our attempts to fire the gunpowder in the *pan* of the pistol succeeded not. *Boyle*.—Any thing hollow: as, the brain-*pan*.—He were shoreful high upon his *pan*. *Chaucer's Monk's Prologue*.

To PAN, v. a. An old word denoting to close or join together. *Ainsworth.*

PAN, in mythology, the deity who presided over huntmen, shepherds, and those whose occupations led them to frequent the fields. He was the son of Mercury, by Dryope, according to Homer. Some give him Jupiter and Callisto for parents, others Jupiter and Ybis or Oneis. Lucian, Hyginus, &c. affirm that he was the son of Mercury and Penelope the daughter of Icarius; and that the god gained the affections of the princefs under the form of a goat, as she tended her father's flocks on mount Taygetus, before her marriage with the king of Ithaca. Others maintain that Penelope became mother of Pan during the absence of Ulysses in the Trojan war; and that he was the offspring of all the suitors that frequented the palace of Penelope, whence he received the name of *Pan*, which signifies "all."

Pan was a monster in appearance. He had two small horns on his head; his complexion was ruddy, his nose flat, and his legs, thighs, tail, and feet, were those of a goat. His education was entrusted to a nymph of Arcadia, called Sinoe; but the nurse, according to Homer, terrified at the sight of such a monster, fled away and left him. He was wrapped up in the skin of beasts by his father, and carried to heaven, where Jupiter and the gods long entertained themselves with the oddity of his appearance. Bacchus was particularly pleased with him. When sent back to the earth, Pan chiefly resided in Arcadia, where the woods and the most rugged mountains were his habitation. Though deformed in his shape and features, yet he had the good fortune to captivate Diana, and of gaining her favour, by transforming himself into a beautiful white goat. He was also enamoured of a nymph of the mountains called Echo, by whom he had a son called Lynx. He likewise paid his addresses to Omphale, queen of Lydia; and it is well known in what manner he was received. (See *OMPHALE*.) The worship of Pan was well established, particularly in Arcadia, where he gave oracles on mount Lycæus. His festivals, called by the Greeks *Lyceæ*, were brought to Italy by Evander, and they were well known at Rome by the name of the *LUPERCALIA*.

The worship and the different functions of Pan, are derived from the mythology of the ancient Egyptians. According to them, he was one of the generals of Osiris, who engaged with Typhon, and whose army being situated in a valley, all the avenues of which were guarded by the enemy, he ordered the soldiers in the night to march with loud exclamations, which, being returned in echoes, terrified the enemy, and put them to flight; whence they say comes the expression of *pan-ic* terror. But Bochart pretends that there is no other reason for making Pan the author of those terrors, except that the Hebrew word Pan, or Phan, denotes a man under consternation. Diodorus Siculus says, that Pan was so much honoured by the Egyptians, that his statues were to be seen in all the temples, and that to his honour they had built in Thebais the city of Chemmis, that is, the city of Pan. This author, who takes no notice of Mendes in Lower Egypt, where that god was in high veneration, adds, that he had accompanied Osiris in his expedition to the Indies, together with Anubis and Macedo. We do not learn from Herodotus why the Egyptians represented the god Pan under the figure of a goat; but ancient mythologists assure us, that they were induced to do this, because Pan, having found the gods in Egypt, whither they had fled from the giants, advised them, as the means of preventing their discovery, to clothe themselves with the figures of different animals; and, as a pattern to them, he himself assumed that of a goat.

Upon the whole, all the Greek fables relating to Pan are said to amount to these particulars: that he was one of the eight great gods of Egypt; that he was honoured especially at Mendes; that his worship was brought into Greece by the Egyptian colonies; that he became more

remarkably famous in Arcadia; that Evander made him known in Italy, where he came and settled with his colony some years before the Trojan war; and that at last the worship of this god was received at Rome with the festivals which were celebrated to his honour. Polyænus attributes to Pan the invention of the order of battle of the phalanx, and of the distribution of an army into the right or left wings, or horns, whence, it is said, he derived his horns. The name Pan, which signifies *all*, has led some to make him the symbol of Nature.

Diodorus makes Pan one of the attendants upon Osiris in his Indian expedition. The same author, however, tells us that he was the leader of a troop of fauns and satyrs, or wild and rustic men, much addicted to singing, dancing, and feats of activity, who were presented to Osiris in Ethiopia; and with whom that prince was so much pleased, that he retained them in his service. He was the inventor of the instrument called the syrinx or fistula; which invention has given birth to a fable in Ovid's *Metamorphoses*.

Pan was regarded by the Egyptians, after his apotheosis, as the god who presided over the whole universe, as *Παν*, all, or all things, implies. He represented nature and festivity, and was god of the woods and fields, wholly taken up with the pleasures of a country life; dancing with the fauns and satyrs, and running after the nymphs, to whom he was such a terror, that it is supposed by some the word *panic* is derived from *panici terrores*, with which those who were said to have seen him were seized. Apuleius, however, gives an agreeable description of him. "By chance the god Pan, happened to be seated on a little eminence near a river, and, always constant in his love to the nymph Syrinx, transformed into a reed, he taught her to produce all kinds of agreeable sounds, while his goats were skipping round him, and feeding on the banks."

Lucian describes him as the companion, minister, and counsellor, of Bacchus; a servant of *all work*, having been occasionally employed in the capacity of shepherd, musician, dancer, huntsman, and soldier. In short, he served not only as *maestro di capella*, to direct the Bacchanals, but was so expert in playing upon flutes, and was such an excellent piper on the fistula, that Bacchus was never happy without him. We have the authority of the grave Virgil, and of the sentimental and pious Plato, for his attributes.

PAN, a city of China, of the second rank, in Setchuen: thirty-eight miles south-south-east of Pao-ning. Lat. 31. 2. N. lon. 106. E.

PAN-SIEN-ING', a town on the west coast of the island of Formosa. Lat. 23. 56. N. lon. 119. 52. E.

PA'NA. See PUNA.

PANACE'A, in mythology, one of the divinities of medicine, the daughter of Æsculapius, to whom were rendered divine honours, as well as to his other children, Hygeia, Thelesphorus, and Iaso. Hence,

PANACE'A, *f.* [from the Gr. *παν*, all, and *αιος*, a cure.] An universal medicine.—The chemists pretended, that it was the philosopher's stone; the civilians, that it was the most consummate point of equitable decision; and the physicians, that it was an infallible *panacea*. *Warton's Hist. E. P.*—An herb; called also *all-heal*:

There, whether it divine tobacco were,
Or *panachæa*, or polygony,
She found, and brought it to her patient deare. *Spenser.*

PAN'ACES, *f.* in botany. See *ARALIA*, *HERACLEUM*, and *LASERPITIUM*.

PANAC'MUS, a musician, quoted by Aristides Quintilianus, whose definition of music agrees entirely with that of the Chinese. "Music, (he said) was not only the order and arrangement of sounds proper to regulate the voice, but was likewise the regulator of all the harmony of nature."

PANA'DA,

PANA'DA, or **PANADO**, *f.* [from *panis*, Lat. bread.] Food made by boiling bread in water.—Their diet ought to be very sparing; gruels, *panados*, and chicken-broth. *Wise man's Surgery.*

PANADOU', or **MANADOU**, a bay on the coast of Cape Breton island, near the south part of the gulf of St. Lawrence.

PANÆI, in ancient geography, a people of Thrace, in the environs of Amphipolis.

PANÆTIUS, a celebrated philosopher of the stoic school, who flourished in the second century B. C. was a native of Rhodes, and descended from ancestors who had distinguished themselves in the military transactions of the republic. His inclination leading him to the study of philosophy, he became a disciple of Antipater of Tarsus, an able supporter of the stoic sect; but he did not implicitly admit all the opinions of the Stoics. He disliked the stoic doctrine of apathy; was a great admirer of Plato, whom he called divine, most wise, and most holy; and he freely borrowed opinions and sentiments from philosophers of every sect. From Rhodes he went to Athens, where he maintained the reputation of the school of Zeno, and had many illustrious disciples. His fame having reached Rome, he was induced to visit that city, where his lectures were crowded by the young nobility, and he enjoyed an intimate acquaintance with several eminent Romans, particularly Scipio and Lælius; and Cicero says, that his abilities and accomplishments rendered him highly worthy of their friendship. According to several writers, he accompanied Scipio in some of his expeditions; particularly, when he was nominated ambassador to the kings and nations in alliance with the republic, for the professed purpose of concerting measures for repressing piracy, and correcting abuses that might lead to the interruption of public tranquillity; but with the real design of obtaining information respecting the internal government, sentiments, forces, &c. of the kingdoms and nations which were the objects of jealousy or cupidity to the Roman senate. In this design he is said to have rendered essential service to Scipio; and he employed his interest with this great man, in conferring various benefits on his fellow-citizens at Rhodes. Panætius appears to have spent the latter part of his life partly at Rome, and partly at Athens; and he died at the last-mentioned city, but in what year we are not informed. His works were held in high estimation by the ancients; but no fragments of them have been preserved to modern times. His moral doctrines were, doubtless, excellent, since they are so highly extolled by Cicero. Astrological predictions, and divinations of every kind, he treated with contempt; and he seems to have rejected the doctrine of the immortality of the soul. *Cicero de Off. lib. ii. iv. Enfield's Hist. Phil. vol. i.*

PANA'GIA, a small island in the Grecian Archipelago, hardly a league in circumference: sixteen miles north-west of Santorin. Lat. 36. 39. N. lon. 25. 5. E.

PANA'GIA, a town of European Turkey, in Romania: fourteen miles north of Gallipoli.

PANA'GRA, in ancient geography, a town of Africa, in Libya Interior, upon the northern bank of the Niger.

PANAGUR', a town of Hindoostan, in Gurry Mundella: ten miles north of Gurrâh.

PANA'IA, a town of Naples, in Calabria Ultra: four miles north of Nicotera.

PANAM-PAL'CA, in botany. See **MYRISTICA**.

PAN'AMA, a province of South America, in the viceroyalty of New Grenada, bounded on the north by the Spanish Main, on the east by the province of Darien, on the south by the Pacific Ocean, and on the west by Veragua. This province has been long considered the most important province of Spain. A branch of the Andes runs through its whole length, the higher summits of which are cold and barren, but the intervening valleys, as well as the low ground, on the Caribbean and Pacific

seas, are rich and fertile, but on the eastern side generally unhealthy. From the centre of the ridge of the mountains of Panama the Southern or Pacific Ocean was first discovered by Balbao in 1513; and the province still continues the most easy point of communication between Europe and Peru. This route is accomplished by ascending the river Chagre from its mouth, near which is fort San Lorenzo, to the small town of Cruces, where the river ceases to be navigable. There is then an ascent by a road, practicable only for horses and mules, to the top of the Andes; an ascent so difficult, that some cannon designed for Panama, having been carried there, were found impossible to be removed. The distance from Cruces to the city of Panama is only five leagues; but from the acclivities, and the badness of the road, it requires twelve hours to perform it. The rapidity of the river Chagre is also a serious impediment, when it is full of water, so that this short journey frequently occupies five or six days. Most of the towns and villages of the province of Panama are situated in small plains along the shore, the rest of the country being covered with enormous and craggy mountains, uninhabited on account of their sterility. This province contains three cities, twelve villages, and a great number of *rancherías*, or assemblages of Indian huts. It has also several gold-mines, but they are greatly neglected, the Spaniards choosing rather to apply themselves to the pearl-fishery, which affords a more certain profit, and at the time is acquired with much greater ease.

The isthmus of Panama, if in the possession of an enterprising people, would be a source of immense national prosperity. A canal should be formed that would unite the two seas, with a city at each extremity; and the commercial advantages would be incalculable. At the bottom of the Bay of Panama, there is an archipelago of at least forty-three islands; between the isles Del Rey and Tobago, the sea is perfectly smooth; and not far from the coast lies a bank, pretty considerable, that contains the objects of the pearl-oyster fishery. The oysters here produce pearls of a very fine water; and some of them are remarkable for their size and figure. These were formerly sold in Europe; but, since art has imitated them, and the passion for diamonds has prodigiously diminished the use of them, they have found a new mart more advantageous than the first. Lima is the port to which these pearls are now conveyed, and from thence they are distributed through the provinces of Peru and Chili, where they are held in great estimation.

All such of the inhabitants of Panama and the neighbouring districts as possess the competent means, keep in their employ, negroes that are in the habit of diving for pearls on account of their masters. They are sent to the islands, where tents and boats are provided for their use. Eighteen or twenty of these unfortunate captives, that are expert swimmers, and constitutionally long-winded, are put under the orders of an inspector; and thus they proceed to sea, till they find an oyster-bank, where the water is not deeper than ten or fifteen fathom. Having fixed on an eligible point, they cast anchor; and the negroes, throwing round their bodies a cord fastened to their boats, and loaded with a little weight, to sink the fooser, plunge into the abyss. When at the bottom, they pluck the oysters; and, placing one under the left arm, another in the left hand, a third under their right arm, a fourth in their right hand, and another in the mouth, they ascend to take breath, and stow their oysters in a small sack kept in their boats. Having reposed a little, they plunge again, and so continue their labours, either till they are fatigued, or have procured a sufficient number of oysters. These diving negroes are obliged to furnish daily a certain number of oysters to their masters. When a negro has fished up this number, he opens his oysters in presence of the inspector, and delivers to him the pearls, great or small, perfect or imperfect,

to

to the stipulated number; the surplus belongs to the negro, who sells them commonly to his master at a cheap rate.

Besides the labour and care requisite to detach the oysters from the bottom of the sea, where they often stick among rocks and stones, they have dangers to dread from the tintorellas or taburones, fish of a monstrous size that devour the divers, as well as from an enormous species of ray that gripe the divers so violently as to strangle them, or, by falling on them with all their weight, crush them at the bottom of the sea. The diver frequently takes with him a sharp-pointed knife, wherewith to pierce these fish, and thus extricate himself. The negro inspector that remains in the boat, when the water is clear, will give warning, and often plunge in to the help of the diver. Notwithstanding these precautions, the negroes will sometimes come up with the loss of an arm or a leg, and sometimes they lose their lives in these perilous encounters.

In the aggregate, this traffic in pearls, gives circulation to a capital, the profits of which may be rated at 250,000 piastras.

PANAMA, the capital of the before-mentioned province, is a city and sea-port, built on the isthmus of Darien, at the bottom of a large bay of the Pacific Ocean. The first discovery of Panama is ascribed to Tello de Guzman, who landed here in the year 1515, when he found only fishermen's huts; and, from its peculiar appropriation to this business, it was called "Panama," denoting a place abounding with fish. In 1518, a colony was established here under Pedrarias Davila, governor of Terra Firma; and in 1521 this place was constituted a city. In 1670 it was taken and burned by the English adventurer, John Morgan; and afterwards rebuilt in its present situation, which is much more convenient, about a league and a half from the former. Being at first generally constructed of wood, it was almost wholly destroyed by fire in 1737, and again rebuilt chiefly of stone. Panama was the seat of a royal audience, abandoned in 1752; and by another fire in 1756, and a decline of commerce, it was reduced to a miserable situation. Nevertheless it is still a strong city, the see of a bishop, and contains several churches and convents. The harbour of Panama is formed in its road under the shelter of several islands, where ships lie safe, at the distance of about three leagues from the city. It is slightly fortified, and might be easily taken by any power that possessed naval superiority on the Pacific Ocean. The trade of Panama is at present inconsiderable: the treasure from Peru is indeed in some degree conveyed through it; but the facility with which voyages round Cape Horn are now made, and the freedom of trade which the court of Spain extended in 1786, have reduced its commerce very considerably. Its only remaining trade is with the villages in its jurisdiction, and with the province of Veragua, the goods being received by Portobello, mostly from Carthagena: the vessels from Peru commonly return empty. The neighbouring mountains produce excellent wood, especially the most esteemed mahogany and cedar, with many precious balsams. The royal chest is so poor, that it cannot even pay the garrison, which is now defrayed from Carthagena. The trade with Guayaquil is maintained by an easy and short voyage; the passage of the line being rather accompanied with calms, while in the Atlantic it is esteemed dangerous. This circumstance, as Pinkerton suggests, may have led to the name of the Pacific Ocean, given, by the Spanish conquerors of Mexico and Peru, before Magalhaens had felt its tempests.

This city was almost destroyed by fire, for the fourth time, in the year 1784. At present the number of inhabitants is about 16,000, of whom a very large proportion are negro-slaves; and these, as we have already observed, are chiefly employed in the pearl-fishery. Lat. 8. 58. 12. N. lon. 80. 15. 15. W.

PANAMA'O, one of the Philippine Islands, about fif-

teen miles in circumference, of a triangular form. Lat. 11. 27. N. lon. 124. 15. E.

PANAMAR'IBA, a river of Guiana, which runs into the Atlantic in lat. 6. N.

PANAMBU'-VAL'LI, in botany. See FLAGELLARIA. PANAMGOO'DY, a town of Hindoostan: twenty-five miles south of Tinevelly.

PANA'MOS, a mountain of Peru, in the diocese of Truxillo. It is part of the Andes.

PANANGOO'DY, a town of Hindoostan: eighteen miles south-east of Madura.

PANANICH', a village of Scotland, in Aberdeenshire, noted for its medicinal springs: thirty-eight miles west of Aberdeen.

PANA'ON, or PANAHAN, one of the Philippine Islands, about forty-five miles in circumference; mountainous, and watered by a great number of small rivers: it is but thinly inhabited. Lat. 10. 7. N. lon. 125. 12. E.

PANAOUETICK', a river of Canada, which runs into the Saguenay in lat. 48. 24. N. lon. 70. 55. W.

PANA'RA, in ancient geography, a town of Arabia Felix, in the isle of Panchæa.

PANARA'GA, a town of the island of Java, and capital of a kingdom situated on the southern side of the island: sixty miles east of Mataram.

PANARCOU'CHI, a town of Hindoostan, in the Carnatic: sixteen miles Cuddalore.

PANA'RD (Charles-Francis), an ingenious French poet, was born about 1690 at Courville near Chartres. He occupied a small post in a public office, when the actor and comic writer, Legrand, having heard a vaudeville of his composition, found him out, and encouraged him to write for the stage. From that time he became the author of a number of dramatic pieces of the light and humorous kind, which were generally well received, and most of which are still occasionally represented. He also excelled in songs, epigrams, madrigals, and especially in the vaudeville, which is a kind of satirical ballad, very popular in France, and often introduced upon the theatre. His satire was never personal, but was directed against vice and folly in general, without marking out individuals. He had the uncommon art of allying some useful moral to his gayest compositions; and his works are stamped with facility, nature, sentiment, wit, and good sense; but are occasionally negligent, prolix, and incorrect. He was uneducated, and drew all from his own sources. Full of vivacity to an advanced age, philosophical and content with little, he closed his life in 1765, in the seventy-fifth year of his age. The works of this author, under the title of "Théâtre et Œuvres diverses de M. Panard," were printed at Paris in 4 vols. 12mo. 1763. *Necrologe François.*

PANARE'TUS, *adj.* [from the Gr. *παν*, all, and *αρετης*, virtue; but not used.] Containing all virtues. *Cole.*

PANA'RIA, a town of Prussia, in Oberland: five miles south of Libstat.

PANA'RIA, one of the Lipari Islands, situated between Lipari and Stromboli, in the Tuscan Sea. It is only five miles in circumference; and the soil is barren. Lat. 38. 40. N. lon. 15. 21. E.

PANA'RO, a river of Italy, which rises in the south part of the duchy of Modena, and runs into the Po near Bondeno, in the Ferrarese.

PANARUCAN', or PANAROCAN, a town of the island of Java, on the north coast; and capital of a kingdom so called, near the eastern part of the island. The principal commerce is in slaves and long pepper: a considerable number of Portuguese are mixed with the inhabitants. Lat. 7. 30. S.

PANA'SA, or PANASSA, in ancient geography, a town of India, on this side of the Ganges, and on its bank. This is the *Pamnah* or *Parnu*, which see.

PANASRES'TI, a town of Turkish Armenia: twenty-eight miles north-west of Cars, and seventeen south-west of Ardanoudjée.

PAN'AT,

PAN'AT, a town of France, in the department of the Aveyron: seventeen miles south of Rhodéz, and eighteen west of Milhau.

PANATAL'LAH, a town of Hindoostan, in the circar of Ruttunpour: forty miles north-west of Ruttunpour.

PANATHENÆA, [Greek.] An ancient Athenian festival in honour of Minerva, the protectress of Athens, whom the Greeks called *Athena*. Harpocration and Suidas refer the institution of this festival to Erichthonius IV. king of Athens, who lived before Theseus. Theodoret alone says the feast was established by Orpheus. Be this as it may, till the time of Theseus it was a particular feast of the city of Athens, and was called simply *Athenæa*; but, that prince uniting all the people of Attica into one republic, they afterwards all assisted at the feast; whence the name *Panathenæa*, i. e. the feast of *all* Attica. In effect all Attica was present; as each people sent a bullock for the sacrifices, and for the entertainment of the vast multitude of people assembled.

There were two festivals under this denomination, the greater and the less. The greater panathenæa were exhibited every five years; the less every three, or, according to some writers, annually. The ceremonies were the same in both; excepting that a *peplus*, or banner, wherein the actions of the goddesses were represented in embroidery, performed by maids, with the names of those who had distinguished themselves in the service of the republic; was only borne at the greater festival.

Prizes were established there for three different kinds of combat. The first consisted of foot and horse races; the second, of athletic exercises; and the third, of poetical and musical contests, as noticed under our article MUSIC. These last are said to be instituted by Pericles.

The following is the order observed in the greater festival, according to M. Barthelemi, who quotes numerous authorities on the occasion: "The inhabitants of the different towns of Attica thronged to the capital, leading with them a great number of victims destined for sacrifices to the goddesses. On the first morning were the horse-races, in which the sons of the first citizens of Athens contended for the honour of the victory. In the *stadium* were other young men struggling for the prize at wrestling, and different exercises of the body; and in the *odæum* were several musicians engaged in gentler and less perilous contests. Some executed pieces on the flute or cithara; others sang, and accompanied their voices with one of these instruments. The subject proposed to them was the eulogium of Harmodius, Aristogiton, and Thrasylbulus, who had rescued the republic from the yoke of the tyrants by which it was oppressed: for, among the Athenians, public institutions are so many monuments for the citizens who have served the state, and lessons for those who are called upon to render it service. A crown of olive, and a vessel filled with oil, were the prizes bestowed upon the victors. Crowns were afterwards conferred on individuals who appeared to the people to have merited that mark of honour by their zeal in the service of their country.

"At the Ceramicus passed a procession, formed without the walls, and which began at that place to file off. It was composed of different classes of citizens crowned with chaplets of flowers, and remarkable for their personal beauty. Among the number were old men of a majestic and venerable appearance, bearing branches of olive; middle-aged men, who, armed with lances and with bucklers, seemed only to respire war; youth, from eighteen to twenty, who sang hymns in honour of the goddesses; beautiful boys, clad in a simple tunic, adorned only with their native graces; and, lastly, girls, who where of the first families in Athens, and whose features, shape, and deportment, attracted every eye. With their hands they held baskets on their heads, which, under a rich veil, contained sacred utensils, cakes, and every thing necessary for the sacrifices. Female attendants, who followed them, with one hand held over them an umbrella, and carried

in the other a folding chair. This is a species of servitude imposed on the daughters of all foreigners settled at Athens: a servitude they share in common with their fathers and mothers, who likewise carried on their shoulders vessels filled with water and honey, for the purpose of libations. They were followed by eight musicians; four of whom played on the flute and four on the lyre. After them came rhapsodists singing the poems of Homer; and dancers armed at all points, who, attacking each other at intervals, represented, to the sound of the flute, the battle of Minerva with the Titans. Next came a ship that appeared to glide over the ground by the power of the wind, and the efforts of a great number of rowers, but which really was put in motion by concealed machinery. The vessel had a sail of light stuff, the *peplus*, on which young girls had represented in embroidery the victory of Minerva over the Titans. On it also they had depicted, by order of the government, some heroes whose illustrious deeds had merited to be celebrated with those of the gods. This procession marched on with solemn steps, under the direction of several magistrates; and traversed the most frequented quarter of the city amidst a crowd of spectators, most of whom were placed on scaffolds erected for the occasion. When it had reached the temple of the Pythian Apollo, the *peplus* was taken down and carried to the citadel, where it was deposited in the temple of Minerva." The *peplus*, though here described as a sail, and in a former part of the article as a banner, was in fact a garment, such as was worn by women of distinction at Athens: it was a long robe that reached to the feet, without any sleeves, and so extremely fine, that the shape of the body could easily be discovered through it. With this *peplus*, the statue of Minerva was decorated at the conclusion of the feast.

"In the evening, at the academy, was the torch-race: The course is only six or seven stadia in length. It extends from the altar of Prometheus, which is at the gate of this garden, to the walls of the city. Several young men are stationed in this interval at equal distances. When the shouts of the multitude have given the signal, the first lights his flambeau at the altar, and, running with it, hands it to the second, who transmits it in the same manner to the third, and so successively. He who suffers it to be extinguished can no more enter the lists; and they who slacken their pace are exposed to the raileries, and even blows, of the populace. To gain the prize, it is necessary to have passed through the different stations with success. This trial of skill was frequently repeated, and is diversified according to the nature of the festival.

"The candidates who had been crowned at the different exercises invited their friends to supper. Sumptuous repasts were given in the prytaneum and other public places, which lasted till the following day. The people among whom the immolated victims were distributed spread tables on every side, and gave a loose to their lively and tumultuous mirth." Anarcharis, vol. ii.

PANATHENÆA'IC, *adj.* Belonging to the panathenæa. PANAU'R, or PONEAU'R, a river of Hindoostan, which rises near Ouscotta in Mysore, and runs into the bay of Bengal near Cuddalore.

PANAX, *f.* [a name borrowed from the old Greek botanists, whose *παναξ*, or *πανακς*, was so denominated from *παν*, all, and *ακς*, a medicine, because of its abundant virtues; and appears, by the account in Dioscorides, to have been a broad-leaved umbelliferous plant, though modern writers are not agreed respecting the species. The name therefore being unoccupied, Linnæus very happily adopted it for the Chinese ginseng, that famous restorative and panacea, whose reputed virtues certainly yield in no respect to the ancient *παναξ*, and which is moreover of the umbelliferous order.] GINSENG; a genus of the class polygamia, order dioecia, or rather perhaps pentandria digynia; natural order umbellatæ, *Linn.* (umbelliferæ, *Juss.*) Generic characters—I. Hermaphrodite 4 L Flowers.

Flowers. Calyx: umbel simple, equal, clustered. Involucre many-leaved, awl-shaped, very small, permanent. Perianthium proper, very small, five-toothed, permanent. Corolla: universal, uniform; proper, of five oblong equal recurved petals. Stamina: filaments five, very short, caducous. Antheræ simple. Pistillum: germen roundish, inferior; styles two, small, upright; stigmas simple. Pericarpium: berry cordate, umbilicate, two-celled. Seeds solitary, cordate, acute, plano-convex. II. Male Flowers on a distinct plant. Calyx: umbel simple, globular; with very many equal coloured rays. Involucre composed of lanceolate sessile leaflets, the same number with the external rays. Perianthium turbinate, quite entire, coloured. Corolla: petals five, oblong, blunt, narrow, reflex, placed on the perianthium. Stamina: filaments five, filiform, longer, inserted into the perianthium. Antheræ simple.—*Essential Character.* Umbel: Corolla five-petalled; stamina five. Hermaphrodite: Calyx five-toothed, superior; styles two; berry too-seeded. Male: Calyx entire.

This is the only known genus of the true digynous umbelliferous tribe, whose fruit is pulpy. That very natural order is so liable to occasional variations in the organs of impregnation, or, in other words, so many of its genera or species are, more or less constantly, polygamous, that it is desirable they should all be kept together in the pentandria digynia, to which they properly belong, notwithstanding that difference of structure which is said to exist between the calyx of the male and that of the perfect flowers. Bernard de Jussieu remarked that there are sometimes three styles and three seeds; and his nephew refers *Panax* to his order of *araliæ*, as does Linnæus to his own, nearly equivalent, order of *hederaceæ*. The smooth, very juicy, and usually beautifully-coloured, berries of *Panax*, are peculiar and characteristic. There are ten species.

1. *Panax quinquefolium*, or true Chinese ginseng: leaves tern quinate. Ginseng has a fleshy taper root as large as a man's finger, jointed, and frequently divided into two branches, sending off many short slender fibres. The stalk rises near a foot and a half high, and is naked at the top, where it generally divides into three smaller footstalks, each sustaining a leaf composed of five spear-shaped leaflets, serrate, pale-green, and a little hairy. The stalk is erect, smooth, round, simple, tinged of a deep purple colour. The leaves arise with the flower-stem from a thick joint at the extremity of the stalk: they are generally three, but sometimes more; the five leaves into which each of these are divided are of an irregular oval shape, veined, pointed, smooth, deep green above, on short footstalks, from a common petiole, which is long, round, and almost erect. The flowers grow on a slender peduncle just at the division of the petioles, and are formed into a small umbel at the top; they are of an herbaceous yellow colour, and appear at the beginning of June. The berries are first green, but afterwards turn red; and inclose two hard seeds, which ripen in the beginning of August. Linnæus remarks, that the seeds produce a ternate leaf, without any seed-leaves, like the monocotyledonous plants. Bernard Jussieu sometimes observed three styles in the flower, and three seeds.

Ginseng is a native of Chinese Tartary, from 39 to 49° of latitude. It has been gathered time immemorial in that country. In 1709, the emperor of China gave orders to ten thousand Tartars to go in quest of these roots, and to bring as much as they could find; every one was to give two pounds of the best to the emperor, and to sell the rest for the same weight of fine silver. In this manner the emperor procured twenty thousand *katye*, or Chinese pounds, in one year.

The Chinese name of *yan-sam* or *gin-sem*, and the American of *garantonges* or *garangtonging*, are both derived from the fancied resemblance with the branching root bears to the human figure. The Tartars call it *orhota*, "the most noble, or queen, of plants." Both they and

the Chinese ascribe extraordinary virtues to this root, and have long considered it as a sovereign remedy in almost all diseases to which they are liable, having no confidence in any medicine, unless in combination with it. Osbeck says, that he never looked into the apothecaries' shops, but they were always selling ginseng; that both poor people and those of the highest rank make use of it; and that they boil half an ounce in their tea or soup every morning, as a remedy for a consumption and other diseases. Jartoux relates, that the most eminent physicians in China have written volumes on the medicinal powers of this plant, asserting that it gives immediate relief in extreme fatigue, either of body or mind; that it dissolves pituitous humours and renders respiration easy, strengthens the stomach, promotes appetite, stops vomitings, removes hysterical, hypochondriacal, and all nervous, affections, giving a vigorous tone of body even in extreme old age. Jartoux himself was so biased by eastern prejudice in favour of ginseng, that he seems to give their extravagant effects full credit, and confirms them in some measure from his own experience. It was in the year 1709 that this author made a delineation and description of the real ginseng on the spot, and sent his drawing and description to the Royal Society, who published both in their Transactions, vol. xxviii. Fig. 2, on the Engraving at p. 265, represents this curious plant. A, the root, which, when washed, was white, and a little rugged and uneven, as the roots of other plants generally are. B C D represent the length and thickness of the stalk; which is smooth and pretty round, of a deepish-red colour, except near its beginning at B, where it is whiter, by its nearness to the ground. D is a sort of knot or joint, made by the shooting out of four branches, which all rise from the same centre, and divide from one another at equal distances, and at the same height from the ground. The under side of the branch is green, mixed with white; the upper part is much like the stalk, of a deep red, inclining to the colour of a mulberry. These two colours gradually decrease, and unite together on the sides, in a natural mixture. Each branch has five leaves, as represented in the figure. It is remarkable, that these branches separate from each other at equal distances, as well in respect of themselves as of the horizon, and make with their leaves a circular figure nearly parallel to the surface of the ground. I do not know that ever I saw leaves so large as these, that were so thin and fine: their fibres are very distinguishable, and on the upper side they have some small whitish hairs; the skin between the fibres rises a little in the middle above the level of the fibres. The colour of the leaf is a dark-green above, and a shining whitish-green underneath. All the leaves are serrated, or very finely indented on the edges. From D, the centre of the branches, rises a second stalk, D E, which is very straight and smooth, and whitish from bottom to top, bearing a bunch of round fruit of a beautiful red colour. This bunch was composed of twenty-four berries, two of which I have here drawn, marked g.g. The red skin of the berry is very thin and smooth: it contains within it a white softish pulp. As these berries were double (for they are sometimes found single), each of them had two rough stones, separated from each other, of the size and figure of our common lentils, excepting that the stones have not a thin edge like lentils, but are almost every-where of an equal thickness. Each berry was supported by a smooth, even, and very-fine, sprig, of the colour of those of our small red cherries. All these sprigs rose from the same centre; and, spreading exactly like the rays of a sphere, they make the bunch of berries of a circular form. This fruit is not good to eat. The stone is like the stones of other common fruit; it is hard, and incloses a kernel. It is always placed on the same plane or level with the sprig that bears the berry; from whence it is that the berry is not round, but a little flat on each side. If it be double, there is a kind of depression, or hollow place, in the middle, where the two parts unite. It has also a small beard at top,

top, diametrically opposite to the sprig on which it hangs. When the berry is dry, there remains only a shrivelled skin adhering close to the stones, and is then of a dark red, or almost black colour. This plant dies away, and springs again every year. The number of its years may be known by the number of stalks it has shot forth, of which there always remains some mark; as may be seen in the figures by the letters *bbb*; from whence it appears that the root *A* was seven years old, and that the root *H*, fig. 3, was fifteen.

"After I had designed the root," says Monf. Jartoux, "I observed the state of my pulse, and then took half of a root, raw as it was, and unprepared; in an hour after I found my pulse much fuller and quicker; I had an appetite, and perceived myself much more vigorous, and could bear labour better and easier than before. Four days after, finding myself so fatigued and weary that I could scarcely sit on horseback, a mandarin, who was in company with us, perceiving it, gave me one of these roots; I took half of it immediately, and an hour after I was not in the least sensible of any weariness. I have often made use of it since, and always with the same success. I have observed also, that the green leaves, and especially the fibrous part of them, chewed, would produce nearly the same effect. The Tartars often bring people the leaves of ginseng instead of tea: and I always find myself so well afterwards, that I should readily prefer them before the best tea; their decoction is of a grateful colour, and, when one has taken it twice or thrice, its taste and smell become very agreeable. As for the root, it is necessary to boil it a little more than tea, to allow time for extracting its virtue, as is practised by the Chinese, when they give it to sick persons; on which occasion they seldom use more than the fifth part of an ounce of the dried root. To prepare the root for exhibition, they cut it into thin slices, and put it into an earthen pot, well glazed, with about half a pint of water: the pot is to be well covered, and set to boil over a gentle fire; and, when the water is consumed to the quantity of a cupful, a little sugar is to be mixed with it, and to be drunk; immediately after this, as much more water is to be put to the remainder, and to be boiled as before, to extract all the juice, and what remains of the spirituous part of the root. These two doses are to be taken, the one in the morning, and the other in the evening."

Ginseng was formerly supposed to grow only in Chinese Tartary, affecting mountainous situations, shaded by close woods; but it has now been long known that this plant is also a native of North America, whence M. Sarrafin transmitted specimens of it to Paris in the year 1704; and the ginseng since discovered in Canada, Pennsylvania, and Virginia, by Lafiteau, Kalm, Bartram, and others, appears to correspond with the Tartarian species, and its roots are now regularly purchased by the Chinese, who consider them to be the same with those of eastern growth, which are known to undergo a certain preparation, by which they assume a somewhat different appearance. This plant was first introduced in England in 1740 by that industrious naturalist, Peter Collinson: The dried root of ginseng, as it is imported here, is scarcely as thick as the little finger, about three or four inches long, frequently forked, transversely wrinkled, of a horny texture, and both internally and externally of a yellowish-white colour. To the taste, says Lewis, (Mat. Med.) it discovers a mucilaginous sweetness, approaching to that of liquorice, accompanied with some degree of bitterness, and a slight aromatic warmth, with little or no smell. It is far sweeter, and of a more grateful smell, than the roots of fennel, to which it has by some been supposed similar; and differs likewise remarkably from those roots, in the nature and pharmacæutic properties of its active principles: the sweet matter of the ginseng being procured entire in the watery as well as the spirituous extract, whereas that of fennel-roots is destroyed or dissipated in the inspissation of the watery tincture. The slight aro-

matic impregnation of the ginseng is likewise in good measure retained in the watery extract, and perfectly in the spirituous.

Ginseng has been considered by the Chinese as a powerful aphrodisiac; but a fact to the contrary is alleged by Dr. Cullen in his Mat. Med. vol. ii. p. 261. Highly as the virtues of this root have been extolled by the Chinese, and by others upon their authority, we know of no proofs, says Dr. Woodville, (Med. Bot.) of its efficacy in Europe; and, from its sensible qualities, we judge it to possess very little power as a medicine. Father Loureiro doubts whether the American ginseng be the same with the precious *gin-sen* of the Chinese. He procured seeds from Tartary, but unfortunately on being sowed they did not germinate. He asserts that the efficacy of the Chinese root is very different from that of Canada; that the latter is therefore sold cheaper; and that the shape is so different, that neither medical practitioners nor merchants can mistake them. If therefore our physicians have only used the root which comes from Canada, they have not given the ginseng a fair trial.

2. *Panax attenuatum*, or taper-pointed tree-ginseng: leaves ternate or quinate; leaflets ovate, attenuated, crenate, trunk arborecent. This is a small tree, with round, smooth, unarmed branches. Leaves scattered, alternate, petioled, quinate, very seldom ternate, and still more seldom septenate. Common petioles round, smooth, longer than the leaves, a foot long, sheathing at the base: sheaths half embracing, within the base of the petiole, above free and acuminate. The last pedicels are half an inch long, and one-flowered. Flowers hermaphrodite, all fertile. Allied very nearly to *P. arboreum*. Native of the West Indies; in Guadeloupe, and St. Christopher's.

3. *Panax trifolium*, or small American ginseng: leaves tern ternate. Stem single, not more than five inches high, dividing into three footstalks, each sustaining a trifoliate leaf, with the leaflets longer, narrower, and more deeply indented on their edges, than in the first species. The flower-stalk rises, as in that, from the divisions of the petiole. Native of North America. Mr. Miller had a single plant of it from Maryland, which he lost by drought before it flowered. It is so nearly allied to the first sort, that Linnaeus doubts whether it be any thing more than a variety of that, only much smaller.

4. *Panax aculeatum*, or prickly shrubby ginseng: leaves ternate, the uppermost next the flowers crowded and simple; petioles and branchlets prickly; stem shrubby. This is a shrub with a recurved prickle at the base and at the tip of the petioles. Leaves solitary, ternate, tern at the flowers; with ovate blunt leaflets. Flowers with three styles. Native of China. Cultivated in 1773, by John Pothergill, M.D.

5. *Panax spinosum*, or thorny tree-ginseng: leaves quinate, alternate; spines solitary, below the branches; umbels lateral. Spines stout, very straight, spreading, instead of a leaf, below the abbreviated shoots of the branchlets. The shoots consist of three or four leaves without a branchlet, and among these leaves is a filiform peduncle with a simple umbel; and small white flowers. Leaves wedge-form, produced at the tip, serrate; the lower ones shorter. Native of Japan, where it was found by Thunberg; but is not mentioned in the Flora Japonica, or in his Travels.

6. *Panax arboreum*, or ferrated tree-ginseng: leaves septenate; (quinate-obovate, serrate-toothed, *Forstl.*) umbels compound. Native of New Zealand.

7. *Panax chrysophyllum*, or golden-leaved tree-ginseng: leaves in sevens and nines; leaflets lanceolate, quite entire, tomentose underneath; umbels panicled. This is a lofty tree, with branches the thickness of the thumb at top; these, the leaves underneath, the younger petioles, the branches of the panicle, the calyxes and petals on the outside, are all covered with a fine golden cottony down. Leaves ternate, compound; leaflets umbelled; the younger ones from three to seven inches in length, the lateral

lateral ones gradually less, drawn to a point at each end, especially on the outside, acute, flat, firm, obscurely veined, of a shining golden colour underneath, as in *Chrysophyllum* *Cainito*, smooth and even above; the full-grown ones a foot long, ovate at the base, nerved, obscurely veined, subcoriaceous, even, glaucescent underneath towards the edge, with a somewhat unequal repand edge, very much attenuated. Petioles round; those of the more advanced leaves a foot long, widening at the base: the partial ones three inches long: both smooth: those of the younger leaves shorter. Umbels peduncled: rays commonly eight, sometimes but seldom from nine to thirteen, a quarter of an inch in length, and spreading very much. Flowers small; calyx only a very short superior rim, obscurely five-toothed. Found by Aublet in Guiana, and Ryan in the island of Trinidad.

8. *Panax fruticosum*, or shrubby compound-leaved ginseng: leaves super-decompound, tooth-ciliate; stem shrubby. This is an upright shrub, six feet high, with a thick juicy unarmed stem, and oblique branches. Leaves bipinnate, with an odd one: leaflets lacinate-serrate, smooth: primary petioles long, swelling at the base, embracing, purple, even. Flowers red and green, terminating, in a diffused panicle, ending in umbels, on a long purple striated peduncle; antheræ oblong, two-celled, incumbent, before the flower expands inclosed in the grooves of the petals. Loureiro did not find any male flower. Native of the island of Ternate. Cultivated in China and Cochinchina; where the root and leaves are used in medicine. The plant has a strong smell and penetrating taste. It is reputed to be diuretic, and to be of service in the dropsy, dysury, gonorrhœa, &c.

9. *Panax simplex*, or simple-leaved ginseng: leaves alternate, lanceolate, serrate; umbels compound. Native of New Zealand.

10. *Panax horridum*, or palmate prickly-leaved ginseng: leaves simple, alternate, palmate, serrate, with prickly ribs; stem shrubby, very prickly. Gathered by Mr. Archibald Menzies, at Nootka Sound, on the west coast of North America. The branches are round, leafy, hispid, beset with innumerable yellow prickles, most crowded about the insertion of each leaf. Leaves on long, furrowed, prickly, somewhat-downy, footstalks, heart-shaped, a span wide, deeply-lobed, sharply cut and serrated, of a fine green; smooth and veiny above, paler beneath. Flowers numerous, in a terminal hispid cluster or spike, shorter than the leaves, whose lower branches are much elongated, imperfectly umbellate, bearing many crowded yellowish flowers, chiefly male, their stamens being large and conspicuous, their styles small or deficient. The upper part of the cluster consists of crowded, imperfectly-umbellate, female flowers, each with two rather spreading styles, and blunt simple stigmas, but few or no stamens.

Propagation and Culture. Ginseng has been introduced into the English gardens from America, and where it has been planted in a shady situation and a light soil, and the plants have thriven and produced flowers, and ripened their seeds annually, but not one of these seeds have grown. Mr. Miller says, "I have sown them several years soon after they were ripe without any success; I have also sown the seeds from America several times in various situations, and have not raised a single plant: and by the accounts which the missionaries have sent from China, it appears that they have had no better success with the seeds of this plant; so that I believe there is a necessity for the hermaphrodite plants to have some male plants near them, to render the seeds prolific; for, all those plants which I have seen, or saved seeds from, had hermaphrodite flowers; and, though the seeds seemed to ripen perfectly, yet their not growing, though I have waited three years without disturbing the ground, confirms me in the opinion." This account agrees with that of Loureiro given above; and shows that the flowers, which are apparently

hermaphrodite, are imperfect. It is a strong confirmation of the sexual system, and would be a proper subject of experiment in the countries where this plant grows naturally. See *FERULA*, *HERACLEUM*, *LASERPITUM*, *PASTINACA*, and *THAPSIA*.

PANAY', an island of Asia, and one of the Philippines, lying between those of Paragoa and Negro. It is 180 miles in circumference, and is the most populous and fertile of them all. It is watered by a great number of rivers and brooks, and produces a great quantity of rice. Its shape is triangular. The names of its principal capes are Potos, Naso, and Bulacabi. The middle of the island is in the latitude of ten degrees. On the north side, almost in the middle between the two capes of Potos and Bulacabi, the famous river Panay falls into the sea; and the mouth of the harbour is covered by a small island called *Lutaya*, in which port the Spaniards had a safe retreat before they discovered and conquered Manila and Gavité. The fertility of Panay is caused by the many rivers that water it, for there is no travelling a league without meeting a river; but more particularly by the Panay, which gives its name to the island, and runs a course of forty leagues. The island contains about 16,360 tributary Indians, partly belonging to the king, and partly to particular lords; but they all pay in rice, the island producing 100,000 bushels, Spanish measure, and but little other grain. The inhabitants are stout and lusty, industrious farmers, and expert hunters, the country being full of wild boars and deer. The women make cloth of several colours. Besides the tributary Indians, there are here those blacks the Spaniards call *Negrillos*, who were the first inhabitants of the island, and afterwards driven into the thick woods by the Bisayas who conquered it. Their hair is not so stiff curled, nor are they so stout and strong, as the Guinea blacks: they live in the most uncouth parts of the mountains with their wives and children, all naked like beasts. They are so swift, that they often overtake wild boars and deer. They stay about the dead beast as long as it lasts; for they have no other subsistence but what they acquire with their bow and arrows. Lat. 11. 15. N. lon. 122. 33. E.

PANAYAS', a town of Portugal, in Alentejo: six miles north-west of Ourique.

PAN'BRIDE, a town of Scotland in the county of Angus. In the reign of Malcolm I. a battle was fought here between the Scots and the Danes, in which the latter were defeated with great loss, and their general killed: ten miles east of Dundee.

PAN'CAKE, *f.* Thin pudding dressed in the frying-pan.—A certain knight swore by his honour they were good *pancakes*, and swore by his honour the mustard was naught. *Shakespeare.*

PANCALE, or PANCALIE'R, a town of Italy, on the Po: twelve miles south of Turin, and five south-west of Carmagnola.

PANCAR'PUS, *f.* A sort of spectacle or show, which the Roman emperors frequently exhibited to the people. The word is formed from the Greek παν, all, and καρπος, fruit; whence the name was also given by the Athenians to a sacrifice in which all kinds of fruits were offered.

The pancarpus of the Romans was a kind of chase, or hunt; for the performance whereof, a number of beasts, as hares, deer, bullocks, &c. were shut up in the circus, or amphitheatre; into which trees were frequently transplanted, so as to form a kind of forest, wherein the beasts were let loose; whence the pancarpus was also called *sythua*. The beasts were thus abandoned to the people, i. e. to all who were disposed to share in the pleasures of the chase, who pursued, shot, killed, and cut in pieces, all they could lay hold of. Heliogabalus, the Gordians, and Probus, gave this diversion very frequently; and it continued till the time of the emperor Justinian, in the sixth century.

PANCAW'IR, a town of Hindoostan, in the Malwa country;

country: forty-two miles west-north-west of Kaajegar, and sixty north of Ougein. Lat. 24. 14. N. lon. 76. 6. E.

PANCHÆA, in ancient geography, an island of the ocean, upon the coast of Arabia. According to Diodorus Siculus, it was inhabited by natives of the country, Indians, Cretans, and Scythians. In this island was a town called *Panara*, whose inhabitants, according to Diodorus, were singularly happy. They had a temple of Jupiter Triphylian, of which this author details all sorts of marvellous circumstances. The other three towns were Hiracia, Dabi, and Oceanis. But the existence of such an island is doubtful.

PANCHAGNI, *f.* An expiatory self-inflicted penance resorted to by Hindoo ascetics. The word means "five fires;" and the mode of the penance is for the devotee to look constantly on the sun, with four other fires close to him. Such devotees are called *Tapaswi*, and are described in Hindoo books very circumstantially, but not, we may conclude, very faithfully, as "standing, with uplifted arm, without aid or support, day and night, seeding on air, immovable, on the right toe, on the afflicted earth," &c. See **TAPAS**.

PANCHAMUKI, a name of the Hindoo deity Siva, meaning "five-faced," he being so represented and described in pictures and books. When five-headed, he has usually ten hands.

PANCHAW', a town of Bengal: forty-three miles north-east of Dacca. Lat. 23. 30. N. lon. 85. 38. E.

PANCHBE'YA, a town of Bengal: twenty-seven miles east-south-east of Purneah.

PANCHCOW'RYE, a town of Hindoostan, in Oude: twenty miles south-south-east of Bahraitch.

PANCHDOWNA, a town of Bengal: twenty miles north-east of Dacca.

PANCHGUR'RY, a town of Bengal: fifteen miles north-north-east of Calcutta.

PANCHGUT'CHY, a town of Bengal: ten miles south of Oliapour.

PANCHMOO'L, a town of Bengal: ten miles east of Rogonathpour.

PANCHPAR', a mountain of Bengal, north of Noony.

PANCHPA'RA, a town of Bengal: fifteen miles north-north-east of Bussunpour.

PANCHPE'ER, a town of Bengal: eight miles south of Oliapour.

PANCHREST, *f.* [from the Gr. *παν*, all, and *χρηστος*, useful.] A panacea, or remedy for all distempers.

PANCHRESTARIL, *f.* Among the Romans, were those who prepared the *panchrest*, or universal remedy.

PANCHRUS, *f.* The name given by some of the ancient writers on natural history to a gem which they say has all colours: probably the opal.

PANCHYM'AGOGUE, *f.* [from the Gr. *παν*, all, *χυμος*, juice, and *αγειν*, to draw off.] A purging extract made from aloes, rhubarb, senna, scammony, jalap, agaric, coloquintida, and black hellebore. Its name arises hence; that, being a composition of all the kinds of purgatives, it was supposed to have the virtue of purging all the sorts of humours from the body at once.

PANCIAT'ICA, *f.* in botany, so named by Piccioli, author of the *Hortus Pantiaticus*, published at Florence in 1783, in compliment to his patron the marquis Niccolò Panchiaticchi, president of the Academy of the Georgofili, and owner of the garden. See **CADIA**.

PANCIRO'LI (Guido), a very learned jurist and antiquarian, son of Alberto Panciroli, also an eminent lawyer, was born at Reggio in 1523. After he had acquired a proficiency in classical literature in his native place, he went to Ferrara for the study of jurisprudence. He successively pursued the same study at Pavia, at Bologna, and finally at Padua. In the latter university his reputation stood so high, that in 1547, while yet a scholar, he was chosen to the second extraordinary chair of the Institutes.

Vol. XVIII. No. 1245.

After having graduated, he was promoted in 1554 to the first chair of the same, and in 1556 he was appointed to the second professorship in ordinary of civil law. This post he held till 1570, when he accepted an invitation from Emanuel Philibert, duke of Savoy, to occupy the chair of law at Turin, with a liberal salary. He continued in that university, till the air of the place had almost destroyed the sight of one eye and endangered the other; when, having with difficulty obtained his dismissal, he returned in 1582 to Padua. The first chair of civil law, with a stipend of 1200 crowns, was there assigned to him; and, notwithstanding the wishes of popes Gregory XIV. and Clement VII. to obtain his professional services at Rome, he preferred the freedom and tranquillity of his situation at Padua, where he died in 1599. He was author of a number of learned works, of which the principal are as follow: 1. *Commentarii in Notitiam utriusque Imperii et de Magistratibus*. This was not only printed separately, but also in the *Roman Antiquities* of Grævius. 2. *De Numismatibus antiquis*. 3. *De Quatuordecim Regionibus Urbis Romæ*. 4. *Rerum Memorabilium jam olim perditarum, et contra recens atque ingeniose inventarum*, lib. ii. 5. A valuable treatise, which was not published till the year 1637, entitled *De Claris Legum Interpretibus*. This, although interspersed with many popular errors, is considered as highly useful in tracing the vicissitudes of jurisprudence, and contains a copious store of curious notices, extracted from the works of the old lawyers, and other authentic monuments. Upon the whole this author displays more erudition than judgment or scientific knowledge. He also left behind him several works in manuscript, which have not yet seen the light. *Gen. Biog.*

PAN'CLA, a mountain of Thibet. Lat. 29. 22. N. lon. 87. 14. E.

PANCO POINT, a cape on the north coast of Java. Lat. 6. 48. S. lon. 112. 44. E.

PANCO'CA, a town of Peru, in the diocese of La Plata: thirty miles south of Potosí.

PANCOR'VO, a town of Spain, in Old Castile, near some mountains called *Pennas de Pancorvo*: four miles west of Mirando de Ebro.

PANCO'VIA, *f.* [so named by Willdenow, in memory of *Thomas Pancovius*, a Berlin botanist, who died in 1665 at the age of 43, having published, in 1654, a quarto volume entitled *Herbarium portatile*, with 1363 wooden cuts, which has since been re-published.] In botany, a genus of the class heptandria, order monogynia, natural order lamentaceæ, *Lim.* (leguminosæ, *Juss.*) Generic characters—Calyx: perianthium of one leaf, bell-shaped, inferior, in four deep, ovate, rather unequal, segments. Corolla: petals four, rather smaller than the calyx, hooded, toothed, plaited, and crisped, their claws inserted into the receptacle, at the base of each segment of the calyx. Stamina: filaments seven, awl-shaped, ascending, hairy half-way up, inserted into the receptacle between the two longer segments of the calyx, and twice their length; antheræ oblong, incumbent. Pistillum: not observed by Willdenow, who found in place of it a glandular depressed body. Isert, who discovered the plant, noted a solitary pistil. Pericarpium and seeds unknown.—*Essential Character*. Calyx bell-shaped, in four deep segments. Petals four, hooded, plaited, crisped, and toothed; with claws. Stamens ascending, longer than the calyx.

Pancovia bijuga, a single species. Native of Guinea. A tree with round branches; the young ones clothed with rusty down. Leaves alternate, abruptly pinnate, of two pair of stalked, coriaceous, elliptical, entire, smooth, veiny leaflets, each terminating in an elongated blunt point. Flowers downy, on downy stalks; bractes ovate, obtuse, densely downy, shorter than the flower-stalks.

PAN'CRAS, an extensive parish in Middlesex, situated north of London, commencing about one mile from Holborn Bars. It not only includes one-third of the

4 M

hamlet

hamlet of Highgate, but the hamlets of Kentish-town, Battle-bridge, Camden-town, Somers-town, as well as all Tottenham-court-road, and all the streets to the west, as far as Cleveland-street and Rathbone-place. It comprises about 2700 acres of land, including the site of buildings. It is bounded by the parishes of Islington, Hornsey, and Finchley, on the north; by Hampstead and Mary-le-Bone on the west; by St. Giles's in the Fields, St. George the Martyr, St. George's Bloomsbury, and St. Andrew's Holborn, on the south; and by St. James's, Clerkenwell, on the east.

The increase of houses in this parish within the last forty years has excited the astonishment of all persons who can recollect its condition previous to that period: for then, as we are credibly informed, there were but two houses between the Foundling-hospital and the old church; whereas the whole distance, about a mile, is now covered with well-built streets. The first augmentation of much consequence happened in the neighbourhood of Tottenham-court road, about the year 1765, when all the streets near Percy-chapel were built. Somers-town was begun in 1786, Camden-town in 1791, Fitzroy-square in 1793, Brunswick-square in 1797, Tavistock-square about 1800, and Euston-square since that time. Of these, however, Brunswick-square is the only one that is finished; Fitzroy-square never will be completed according to the original plan.

Kentish-town has been enlarged more than two-thirds within these twenty-five years, and a considerable number of streets have been built between Brunswick and Russell squares, and the New Road. Many houses have likewise been added at Battle-bridge; and hence this parish is now by far the most populous of any in the vicinity of London. According to the late parliamentary returns (1811), it contained 6743 houses, and 46,333 inhabitants; and it is generally supposed that the forth-coming returns for the present year (1820), will carry the numbers up to 60,000.

Pancras is said to have been a parish before the Conquest; and is mentioned in Domesday-book. It derived its name from the saint to whom the church is dedicated. That edifice is of very ancient date, and is certainly the smallest parochial church in London or its vicinity: it consists only of a nave and chancel, with a low tower at the west end, crowned with a dome: it is built of stones and flint, since covered with plaster. Norden, who wrote his *Speculum Britannie* about the end of Elizabeth's reign, describes the church as "standing all alone, utterly forsaken, old, and weather-beaten;" and, in some MS. additions to his work now in the possession of Mr. Nichols, he adds, "Although this place be, as it were, forsaken of all, and true men seldom frequent the same but upon devyne occasions; yet it is vifited by thieves, who assemble there, not to pray, but to waite for praye; and men fall into their handes clothed, that are glad when they are escaped naked. Walke not there too late." It has been lately ascertained, that this church was built about the latter end of the fourth century: the date was found at Rome some years ago by the Rev. Dr. Champneys, a former vicar. The church contains some very old tablets and monuments. One in brass, in German text, is as follows: "At this puees end here lyeth buried Marye Beresford, the daughter of Alexander Glover, of Tottenham Courte, and the deare and well-beloved wife of John Beresford, Gentleman and Barester, of Grayes Inne, who departed this life the 21 day of August, in the yeare of our Lorde God 1588, whose soule is with God, for she trusted in the Lorde, and reposed her salvation wholye in Jesus Christ, in whome is all peace and rest, all ioye and consolation, all felicity and salvation, and in whome are all the promyses, yea and amen." There are some very ancient, without name or date. We shall copy one more: "A memoriall both to Daniell Clarke, esq. who left this life most comfortable the last of June 1626, Anno Etat. sue 79, having been Master Cooke to Queene Elizabeth

and to King James 29 yeare, called to that place betimes for his worthines, beloved there and elsewhere for his honest heart and open hand; and also of Katherine, his good and loving wife, who left this life the 24 of June 1613, A^o Etat. sue 50.

Reader, before this monumental stone
Two bodies lye interr'd that once were one;
Whom Death did for a time divorce,
But now hath married coarfe to coarfe.
Their ashes meete in death, and have
For their new marriage-bed the grave;
A third they yet expect, that fate
Nor time nor force shall violate,
Wher both shall married and unmarried bee,
Not to themselves but to eternitie.
Then sleep ye happy ashes there,
Nor let a groane, a sigh, or teare,
Disturbe your rest, till the glad noyse
Of the world waking trumpitts voyse
Raife you from this dead sleep, and call
Your dust from this sad funerall,
To wed their souls, and soul and body bring
Unto the marriage of their Lambe and King."

In this church and in the surrounding cemetery, are buried most of the Roman Catholics who die in the metropolis, among whom are several eminent French refugees. Here also rest the ashes of Jeremy Collier, the pertinacious non-juror; and William Woollet, the celebrated engraver, whose monument, in the cloisters of Westminster-abbey, is criticised under our article LONDON, vol. xiii. p. 557.

The church-yard was enlarged in 1793, by the addition of a large piece of ground to the south-east, in which is to be seen the monument of Mrs. Godwin, (the celebrated Mary Woolstonecraft;) the author of the *Rights of Woman*, and of other publications which excited general attention: she died in child-bed, September 10, 1797, in her forty-ninth year. Here likewise were buried the Rev. Arthur O'Leary; the celebrated Corsican general Paoli, who died in 1807, aged eighty-two years; the Chevalier d'Eon, 1810, aged eighty-three years; Mr. Edwards, author of a *Treatise on Perspective*; Tiberias Cavallo, a well-known writer on subjects of Natural Philosophy; Mr. John Walker, author of the *Pronouncing and Rhyming Dictionaries*; and many other persons of eminence for their actions or their writings.

The deficiency in the size of the parish-church has been in some degree supplied by chapels distributed in different quarters: the principal of these are—Kentish-town chapel; Percy-chapel, near Tottenham-court-road; Fitzroy-chapel; Woburn-chapel; Bethel-chapel, at Somers-town; St. James's Chapel; and St. Giles's chapel, belonging to the parish of St. Giles's in the Fields. The large Methodist-chapel in Tottenham-court-road, called Whitfield's Tabernacle, is also within this parish: it contains a monument commemorating his pious labours. Several burying-grounds annexed to other parishes are likewise locally situated in Pancras; as the cemeteries of St. Andrew, Holborn, St. George the Martyr, and St. George's Bloomsbury.

At length it has been thought proper to build a new church in a more central part of the parish. This edifice, which is now pretty well advanced, will form the south-east side of Euston-square, the New Road dividing it from the north-west side. It is of plain Grecian architecture, and will be capable of containing upwards of four thousand persons. We have been favoured with a drawing of the church, as it is to be when completed, which is represented on the annexed Engraving. The portico, which fronts the west, is copied from the Erechtheum, or Temple of Neptune Erechtheus, at Athens; (see *ATHENS*, vol. ii. p. 468.) The tower is to resemble that of the Temple of the Winds; and the entrance to the vaults is to have cypress pillars after the manner of some

St. Pancras new Church.

some other Greek temple, whose name has not reached us. The turreted house to the right of the spectator, is the residence of Mr. Inwood, the architect.

The first stone of the building was laid by his Royal Highness the Duke of York, on the 1st of July, 1819; and on that stone was the following inscription:

ΜΑΚΑΡΙΟΦΩΣΕΥΑΛΛΕΛΙΟΥΟΥΤΟΣΑΕΙ
ΦΟΤΙΖΟΙΤΟΣΕΘΝΟΝΑΦΑΝΕΙΣΝΕΟΣ

Which in modern Greek characters would read thus; *Μακαριω φως ευαγγελιστης εστις αει φωτιζων τους εθνας αφανεις νεως*. In English, "May the light of the blessed Gospel thus ever illuminate the dark temples of the Heathen." Our readers would probably think this a very proper inscription for a Heathen temple converted into a Christian church; or even for a Christian church founded upon the site of a Heathen temple; but would be at a loss to understand the meaning of it under the present circumstances, or see the propriety of an inscription in Greek, and still less for putting it in antique characters. We must therefore inform them, that the inscription was copied from one of the Heathen Greek temples we have mentioned, which has been converted into a Christian Greek church: but what this has to do with St. Pancras remains to be proved. The following English lines were intended to accompany the representation of the building engraved from the architect's original drawing:

In chaste magnificence God's temple stands,
The blended effort of Man's mind and hands:
O thou who gav'st him both—to whom he owes
A nobler tribute than earth's bosom shows—
Accept his off'ring, as an outward part
Of infelt love,—an earnest of the heart!
And, when within its walls thy awful Name
Shall sanctify his lips, oh! let the flame
Of holiest gratitude inspire his pray'r
With fervours angels need not blush to share;
Here may thy special presence win each breast
To seek and find—joy, purity, and rest!

At a small distance beyond the old church, on the way to Kentish-town, stands the workhouse, built in 1814. It is a noble brick building; and perhaps it will be difficult to find such another workhouse in the kingdom. At the back part, at a little distance, is the infirmary. The parish is governed by a select vestry, of which the vicar is president. The Rev. James Moore, LL.D. is the present vicar, who is universally esteemed, as one of the ablest advocates of all charitable institutions; and is one of the most learned, energetic, and eloquent preachers of the present day.

Many public institutions, for charitable and other purposes, are situated within this parish. Some of them, as the Foundling Hospital and the Welsh charity-school, have been noticed under the article LONDON, vol. xiii. p. 587-9. The Hospital for Inoculation, and the Natural Small Pox Hospital, are situated in a field close to Battle-bridge turnpike. Both these excellent charities were founded in 1746; but the present buildings were only erected, the former in 1765, and the latter in 1793. The building consists of a main body and two wings, with a cupola, raised on a turret of six sides, in the centre. Here is also an Hospital for Typhus and Scarlet Fever.

At Camden Town, in this parish, stands the Veterinary College, a new and singular institution in this country, established in the year 1792, under the auspices of persons of the first rank and fortune in the kingdom. The design is for the improvement of farriery and the treatment of cattle in general; but perhaps it is more immediately intended to promote a reformation in that particular branch of veterinary science called farriery; and to regulate the management and cure of disorders incident to

horses, and frequently the lives of those truly-valuable animals, from the hands of the unskilful and illiterate. It is calculated also to render that a respectable profession, which has hitherto been considered a disreputable occupation, beneath the study and attention of men of liberal education.

It is stated in "Boardman's Dictionary of the Veterinary Art," that the public are indebted for this truly national foundation to the humanity, discernment, and patriotic exertions, of a country agricultural society, that of Odiham in Hampshire; and that the first professor of it was a Frenchman of the name of St. Bel, or Sainbel, who had previously distinguished himself as a veterinary anatomist and writer in this country, by dissecting and describing different parts of the famous race-horse Eclipse, so much known and admired for his swiftness.

The college is chiefly supported by public subscription; the annual contribution is two guineas, but the payment of twenty guineas at one time constitutes a member for life. And in some instances the institution has shared the bounty of parliament; an important saving having resulted to the nation from the appointment of veterinary surgeons to the different regiments of British cavalry, in consequence of it.

The late duke of Northumberland was the first president of the college. There are likewise, eleven vice-presidents, twenty-four directors, a treasurer, professor, secretary, and collector. The president, vice presidents, and ten of the directors, the treasurer and collector, are chosen annually, by ballot. The entire management of the college is in the council, which consists of the president, vice-presidents, and directors; subject to the controul of four quarterly general meetings of the subscribers. The building extends in front 170 feet, and consists of a house for the professor and secretary; apartments for the pupils; committee-rooms, &c. In the plan likewise was included an amphitheatre, a museum, a laboratory, a room for pharmacy, an operating-room, a forge, very commodious stabling for 500 horses, a spacious riding-house, a botanical garden, &c. The depth of the building is 650 feet.

Dr. Colman is the professor who gives lectures in this college. The anatomical structure of quadrupeds and other animals, such as horses, cattle, sheep, dogs, and others, the diseases to which they are subject, and the remedies proper to be applied, are investigated and regularly taught; by which means, enlightened practitioners of liberal education, whose whole study has been directed and devoted to the veterinary art in all its branches, may be gradually prepared, provided, and dispersed over the whole kingdom, on whose skill and experience confidence may be securely placed.

Pupils to the college, in addition to the lectures and instructions of the professor, and the practice of the stables, enjoy the great advantage of free admission to the medical and anatomical lectures of the metropolis. These pupils, previous to leaving the college, are strictly examined by a medical committee, from whom they receive a proper certificate; and several, examined and approved, have, it is said, already left the college, and are at this time practising in various parts of the country with great success. Subscribers have the privilege of sending their diseased animals to the college, without further expense than that of their daily food; and these, in general, form a sufficient number of objects for the practice of the professor and pupils to be tried and exercised upon. On fixed days, the professor prescribes for animals belonging to subscribers who find it inconvenient to spare them from home, provided the necessary medicines be furnished and compounded at the college. Subscribers' horses are there also shod at the ordinary price, and new improved modes of shoeing practised in different cases.

His royal highness the commander-in-chief having been pleased to appoint a board of general officers to take into consideration the objects of this institution, they reported

the continual loss of cavalry to have been very heavy, in consequence of the almost total ignorance of those who have hitherto had the veterinary department in the army. This report his majesty approved; and henceforward, to qualify for the military service, a veterinary surgeon must be provided with a regular diploma from this college. A number of gentlemen, subscribers to the institution, attend once a fortnight, for the purpose of inspecting the discipline of the stables, and seeing that the regulations are duly complied with.

These form the most material objects and regulations of the establishment; from which it is evident, that it is capable of being of great use and advantage, if properly directed, and confined to the points which it has principally in view. We are informed, moreover, that a volume of the Transactions of the Society are published annually, and presented gratis to each subscriber.

In different parts of the parish are various sets of almshouses, and sundry charity-schools, among which we may mention the national school for 800 children near Euston-square, and one at Kentish-town for 200. The female charity-school in the Hampstead-road, supported by voluntary contributions, contains 70 girls, who are entirely clothed, boarded, and educated. A national school is now in progress near Brewers-street, Somers-town, which will accommodate 300 girls and as many boys.

At the top of Tottenham-court-road, where the King's-head public house now stands, there was a palace of king John's, but of which there are now no remains. And at Kentish Town, near the Castle-tavern, is the building (now a private house) which was formerly king John's dog-kennel.

Two miles from Tottenham-court-road, towards Hampstead, on the left hand, is Chalk-farm, of duelling notoriety.

The Regent's Canal passes through this parish from the Regent's Park to White Conduit House, where the tunnel begins, which goes under Islington on its way to the Thames. Its course is between Camden and Kentish Towns: there are six bridges and two locks in the distance of one mile. See the article PADDINGTON, p. 183.

The barracks lately erected for the reception of the life-guards are in this parish: they are situated on the banks of a branch of the canal which runs up to the basin at the Jew's Harp, near Portland Place.

At a place called the Brill, on which part of Somers-town is built, was an entrenchment, supposed by Dr. Stukeley to have been the camp of Julius Cæsar; but others think it by far more modern, and nobody knows to whom it really belonged.

Bagnigge-wells, situated in this parish, has been noticed under ISLINGTON, vol. xi. Another mineral spring near Pancras-church was formerly in great repute, but is now abandoned. The water of this spring was similar in its properties and effects to that of St. Chad's Well, near Battle-bridge, which is still held in considerable estimation for its diuretic and aperient qualities.

Caen-wood or Ken-wood, the beautiful seat of the earl of Mansfield, is situate at the northern extremity of the parish, between Hampstead and Highgate. The mansion, though hidden from the notice of passengers on the road, is delightfully and fantastically situate in the wood by which it is completely surrounded. The pleasure-grounds and gardens are most tastefully laid out; the judicious arrangement of wood, water, and pleasure-ground, make it indefinably beautiful. It is impossible to do it justice in description; it is a perfect terrestrial paradise, and must be seen before it will appear credible that there should be such a charming and retired spot so near London, the distance being little more than three miles. This place was purchased, in 1755, of the earl of Bute, by the first earl of Mansfield, then attorney-general, who improved the whole, with great elegance, after the designs of the celebrated architects of the Adelphi. The grand front, which is near the side of the road leading from Highgate

to Hampstead, is opposite the wood that gives name to the house. The garden-front, which is more extensive than the other, commands a fine view of rich meadows, falling in a gentle descent, and relieved by some noble pieces of water, (the reservoirs of the Hampstead water-works,) that supply part of the metropolis: this view is terminated by the spires of London, and the distant hills of Kent. The most remarkable room in the house is the library, a beautiful apartment, sixty feet by twenty-one, designed by Adam, and ornamented with paintings, by Zucchi. In this room is a whole-length of the first earl by Martin, and a fine bust of him by Nollekens. There is another bust of his lordship, when young, in the hall; one of sir Isaac Newton; and the antique bust of Homer, which was bequeathed to the first lord Mansfield by Pope. In the breakfast-parlour, is a bust of Pope, and a portrait of sir Christopher Hatton. In the other rooms are some portraits, well deserving of notice; particularly those of Pope, Garrick, the duchess of Queensberry, and a good head of Betterton, the tragedian, said to be by Pope, who had been instructed in the art of painting by his friend Jarvis; two landscapes, supposed by Claude; a piece by Teniers; and Wilkie's Village Politicians. Here, too, are some fine portraits, among which is the picture of lord Mansfield, by sir Joshua Reynolds, from which a well-known engraving has been made. The music-room was painted by Julius Ibbetson, and exhibits, in panels, the various operations of agriculture, (fancifully represented as carried on by unattired children,) interspersed with views in North-Wales, sweetly delineated. The pleasure-grounds, including the wood which gives name to the place, contain about fifty acres. The situation is naturally beautiful; and the hand of art has been successfully employed in making them still more picturesque. On the right of the garden-front of the house, is a hanging-wood of tall spreading trees; and, on the left, the rising hills are planted with clumps, that produce a pleasing effect. A fine shrubbery immediately before this front, and a serpentine piece of water, render the whole a very enlivening scene. Hornsey great woods, held by the earl of Mansfield under the bishop of London, join this estate on the north, and have been lately added to the inclosures. It must be here noticed, as a circumstance of local interest, that Venner, the fanatic, who created a disturbance at the head of the fifth monarchy-men, in January 1661, sought a retreat with his followers, for a short time, in Ken Wood.

Near this place, at Highgate, is Holly Lodge, the beautiful seat of Mr. Coutts, the banker. *Wilkes's British Directory*, vol. v. *Wakefield's Perambulations in London*. *Ambulator*. *Lambert's Hist. of London*, vol. iv. *Lisbon's Environs of London*, vol. iii. 1795. and *Supplement*, 1811. *Private Communications*, Nov. 1820.

PANCRA'TIAN VER'SE, the name of a sort of Greek verse, consisting of two trochees and a supernumerary syllable: *Πενταχορδα*. It is so called from its supposed inventor Pancrates, who is said to have lived in the time of Alexander the Great.

PANCRA'TIC, or PANCRA'TICAL, *adj.* [from the Gr. *παν*, all, and *κρατος*, power.] Excelling in all the gymnastic exercises.—He was the most *pancratical* man of Greece, and, as Galen reporteth, able to persist erect upon an oily plank, and not to be removed by the force of three men. *Brown*.—Arrived to a full *pancratick* habit, fit for combats and wrestlings. *Hammond*.

PANCRA'TIUM, *f.* [Greek; compounded of *παν*, all, and *κρατος*, I overcome.] Among the ancients, a kind of intermixed exercise, consisting of the *ludia*, or wrestling, and the *pugilate*, or boxing. The pancratium was the third gymnastic exercise, and was not introduced till long after the others. The people, who were engaged in these exercises, were called *pancratiastæ*; which name was also given to such as did not confine themselves to one exercise, but succeeded in several different ones.

As this exercise partook both of the *castus* and the *pala*,

as we learn from both Aristotle and Quintilian, the athlete borrowed many things from each of these sciences to render himself eminent in the pancratium. It was necessary for him to learn how to trip, and strike, and box, and grapple with his antagonist; to stand with firmness, fall with advantage, and rise with vigour and celerity, or maintain the combat upon the ground; to attack and to defend, to annoy and resist his enemy in every attitude; and to employ in one or other of those purposes every limb, nerve, and sinew, all the faculties and all the strength of his whole body, which is implied in the word *pancratium*; and this term gives the best account of an exercise, in which the combatants were allowed (under certain restrictions) to make what use they thought proper of all the arms which nature had given them, both offensive and defensive, and of only those: for neither (as in the *causus*) were their hands and fingers bound up or armed, nor their legs and feet prohibited from joining in the battle, nor were they constrained from striking, as in the *pala*. With no further arms than those, however, they were able so to mangle and injure one another, that it was thought proper to subject them to some restraints; lest a contest, in which they engaged for victory and honour, should be disgraced by murder or malice, and the combatants be provoked to encounter one another in a manner more becoming beasts than men. An athlete was therefore forbidden to kill his adversary designedly, to dig or pluck out his eyes, to tear him with his teeth, or strike him under the ribs with the ends of his fingers; but, notwithstanding these restrictions, scope enough was left for the combatants to exercise their skill and strength, their courage and resolution; because it was a common practice for a pancratiast to choke the strength and skill of his antagonist by twisting and entangling himself about his legs and arms; and to endeavour by fatigue, and pain, and suffocation, to worry him into a surrender of the victory. The pancratium was forbidden by the Spartan legislator, whilst he allowed and encouraged many contests no less rude and bloody; for, the law of these exercises requiring that one of the two combatants should yield, either in words, or by stretching out his hand or finger, or by giving some other testimony of his so doing, Lycurgus forbade his Spartans to engage in them, because, as he said, he would not have them accustom themselves to yield the victory, not even in sport. The combatants in these exercises were naked; and, as it was necessary to pair them, this, we may suppose, was done by lot. Pausanias speaks of a pancratiast named Sostratus, who had an easy method of obtaining the victory in these contests: his custom was to seize fast hold of his adversary's fingers, which he broke, and never quitted his hold till they renounced the contest. This method gained him twelve Isthmian and Nemean, two Pythian, and three Olympic, crowns, together with a statue at Olympia, and the surname of Acro-Cherites. *West's Pindar*, vol. iii. *Anachar-sis*, vol. iii.

PANCRA'TIUM, *f.* [of Pliny and Dioscorides; from *πας*, all, and *κρῆλος*, power; i. e. an herb of every virtue.] In botany, a genus of the class hexandria, order monogynia, natural order of spathaceæ, (narcissi, *Juss. lilia*, *Roy.*) Generic characters—Calyx: Spathe oblong, obtuse, compressed, opening on the flat side, shrivelling. Corolla: Petals six, lanceolate, flat, inserted into the tube of the nectary on the outside above the base. Nectary one-leafed, cylindric-funnel-form, coloured at top, with the mouth spreading, and twelve-cleft. Stamina: Filaments six, awl-shaped, inserted into the tips of the nectary, and longer than they are; antheræ oblong, incumbent. Pistillum: Germen bluntly three-cornered, inferior; style filiform, longer than the stamens; stigma blunt. Pericarpium: Capsule roundish, three-sided, three-celled, three-valved. Seeds several, globular.—*Essential Character*. Petals six; nectary twelve-cleft; stamina placed on the nectary.

This genus consists of perennial plants with very large

bulbous roots, from whence proceed long leaves, some very narrow, others broad, and a strong straight upright scape from one to three feet high, terminated by a large spathe, bursting on one side, and disclosing in some of the species many, in others only one or two, white flowers of great elegance and fragrance. There are fifteen species, six of which have been described by Mr. Salisbury in the 2d vol. of the *Linn. Transf.* 1791.

1. *Pancratium Zeylanicum*, or Ceylonese pancratium: spathe one-flowered, petals reflex. This has a pretty large bulbous root. Leaves long and narrow, of a greyish colour, and pretty thick, standing upright. The stalk rises among them a foot and a half high, naked, sustaining one flower at the top. Nectary large, cut at the brim into many acute segments. Stamens long, and turning towards each other at their points, in which it differs from the other species. The flower has a very agreeable scent, but is of short duration. Native of Ceylon. Cultivated by Mr. Miller in 1739.

2. *Pancratium Mexicanum*, or Mexican pancratium: spathe two-flowered; stem or scape a long span in height, round, forked towards the top, or dividing into two peduncles, with two oblong, tender, membranaceous, greenish leaflets, and terminated each with a white flower, divided to the very base into six narrow segments; in the middle of these is a white bell-shaped tube, which Linnaeus names the nectary, more tender than the petals; the mouth angular, and from each angle putting forth a filament, long, slender, and white, terminated by an oblong, incurved, saffron-coloured anther. The flowers have no smell, and shrivel up over the fruit. Leaves four, reclining, smooth, pale-green, and somewhat glaucous; rigid, slightly grooved in the middle, and with a single streak on each side, otherwise veinless; a long span or a little more in length, an inch and a half in width, produced to a point at the end. It flowers in May, from bulbs brought from Mexico.

3. *Pancratium Caribæum*, or Caribean pancratium: spathe many-flowered, leaves lanceolate, segments of the corolla linear, and longer than the tube; leaves about a foot long and two inches broad, having three longitudinal furrows. The stalk rises about a foot high, then divides like a fork into two small footstalks, or rather tubes, which are narrow, green, and at first encompassed by a thin spathe, which withers, and opens to give way to the flowers: these are white, and have no scent. Native of the West Indies. Dr. Browne says, it grows wild in most parts of Jamaica, and the other sugar-islands, with large leaves and numerous flowers, seldom rising above sixteen or eighteen inches in height. Dr. Houttoun brought some of the roots from Vera Cruz; and it was cultivated by Mr. Miller in 1730.

β. Mr. Salisbury has figured and described a species which he has often received from Barbadoes, and which he suspects may be the same with that of Sloane and Martyn, but different from that of Commelin; which he refers to his *amœnum*, the *declinatum* of Jacquin. He names it *Pancratium fragrans*, and gives this specific character: Petioles wide; tube of the corolla six-cornered, not freaked; segments longer than the tube, recurved, linear, alternately more concave, the sinuses of the crown repand emarginate. He thus describes it: Plant a foot and a half high; leaves seven to ten, green, bifarious; petioles sheathing at the base, spreading, half round; the leaves themselves much longer than the petioles, recurved, lanceolate, quite entire, blunt, a little channelled, smooth, especially above, fleshy. Flowers very fragrant, from seven to twelve in a bunch. Peduncle (or scape) pale glaucous, among the inner leaves, a little shorter than they; after flowering bent down towards the ground, compressed, ancipital, smooth with a glaucous bloom, slightly streaked, solid. Germ bright-green, shortly pedicelled, oval, three-cornered, smooth with the same glaucous bloom. He affirms, that Linnaeus has made up his *P. caribæum* from the doubtful synonyms of

Sloane and Martyn, and that of Commelin, which, according to him, does not belong to this species. Miller's plant does not seem to be the same with Mr. Salisbury's, and consequently not Martyn's, which is undoubtedly the same with Miller's. *Lin. Transf.* ii. 72.

4. *Pancratium maritimum*, or sea-pancratium: spathe many-flowered, petals flat, leaves tongue-shaped. This has a large coated bulbous root, three inches in diameter, of an oblong form, covered with a dark skin. The leaves are shaped like a tongue; they are more than a foot long, and one inch broad, of a deep green, six or seven of them rising together from the same root, encompassed at bottom with a sheath; between these arises the stalk, which is a foot and a half long, naked, sustaining at the top six or eight white flowers, inclosed in a sheath, which withers and opens on the side, to make way for the flowers to come out. The germs are situated close to the top of the stalk; from these arise the tubes of the flowers, which are three inches long: they are very narrow, swelling at the top, where the cup or nectarium is situated, on the outside of which are fastened the six segments or petals of the flower; these are narrow, and extend a great length beyond the nectarium; from the border of the nectarium arise six long slender stamens, terminated by oblong summits, which are prostrate; and in the centre arises a style the length of the stamens, terminated by an obtuse stigma.

Mr. Miller, in his figures, has added some particulars. The root resembles that of the squill, but is less, covered with a brown skin, and white within; the coats pellucid and gently striped, viscid or full of a clammy juice, bitter to the taste without acrimony. Cavanilles remarks, that the leaves are too broad in Miller's figure, as they might well be in a garden-specimen; that Clusius's small figure observes the proportion of the parts; but that his own is in due size and proportion both. He informs us also from Clusius, that this plant very seldom flowers when it is removed from its native soil, and then only when the flower is formed in the bulb.

Mr. Salisbury makes not only the *P. maritimum* of Linnæus and Cavanilles (whose figure he condemns) synonymous with *maritimum*; but also the Carolinianum of Linnæus, and the *verecundum* of the Kew Catalogue. He describes it as a plant a foot and half in height. Leaves six or seven, bifarious, sheathing at the base, from upright spreading, more or less twisted, linear, quite entire, blunt, smooth on both sides with a glaucous tinge, a little striated, flattish, fleshy. Flowers sweet, from six to ten in a bunch. Peduncle (or scape) pale glaucous, from one side among the leaves, erect, compressed, blunt not ancipital, even. Germ pedicelled, oval, three-cornered. Tube of the corolla pale-green, cylindrical, angular at top: border snow-white, a little shorter than the tube. Mr. Salisbury remarks, that it seldom flowers when cultivated, which agrees with what was observed above by Cavanilles from Clusius. He gathered it on the sandy coast below Montpellier in 1786. This, if any, is the true *maritimum* of Dioscorides. It is a native of the south of Europe in general; as in Spain about Valencia, &c. on the coast; found by Clusius near Montpellier; by Ray near Naples and in Sicily. Cultivated in 1629, by Mr. John Parkinson.

5. *Pancratium declinatum*, or broad-leaved pancratium: spathe many-flowered, scape compressed ancipital, segments of the corollas a little longer than the tube. Leaves tongue-shaped, sharp at both ends, quite entire, shining, erect, three feet long, three or four inches wide. Scape the length of the leaves, very much compressed, ancipital, an inch and a half wide, green; the whole always prostrate. Spathe twelve-flowered or thereabouts: flowers sweet, white, sessile, almost half a foot in diameter.

Mr. Salisbury, disliking Jacquin's trivial name, because several other species have a *declinate* scape, when in fruit; and also the younger Linnæus's, of *excisum*; has given this species the name of *amœnum*, and refers Commelin's figure in t. 87. to this, which Linnæus applied to his

caribæum. According to him, the plant is two feet high. Leaves nine to twelve, green, bifarious, sheathing at the base, recurved, lanceolate, quite entire, bluntish, smooth on both sides, finely streaked, channelled, keeled at the base, fleshy. Flowers fragrant, from ten to fifteen in a bunch. Peduncle (or scape) pale glaucous, among the inner leaves, a little shorter, at first upright, but after flowering bent down, very much compressed and ancipital, smooth with a bloom, a little streaked, solid. Probably a native of Cayenne. Cultivated in gardens at Martinico.

6. *Pancratium Carolinianum*, or Carolina pancratium: spathe many-flowered, leaves linear, stamens the length of the nectary. This has a roundish bulbous root, covered with a light-brown skin, from which arise several narrow dark-green leaves, about a foot long: among these comes out a thick stalk (scape) about nine inches high, sustaining six or seven white flowers, with very narrow petals, having large bell-shaped nectariums or cups deeply indented on their brims. The stamens do not rise far above the nectarium. Catesby discovered it in moist boggy soils in Georgia. Native of Jamaica and Carolina. Cultivated in 1759, by Mr. Miller. According to Mr. Salisbury, this is not different from *maritimum*.

7. *Pancratium Illyricum*, or Illyrian pancratium: spathe many-flowered, leaves ensiform, stamens longer than the nectary. This has a large bulb, covered with a dark skin, sending out many thick strong fibres, striking deep in the ground. Leaves a foot and a half long, and two inches broad, of a greyish colour. Scapes thick, succulent, near two feet high. Flowers from seven to fifteen in a bunch, white, sweet, shaped like those of *maritimum*, but with a shorter tube, and much longer stamens. It flowers in June, and frequently produces seeds, which ripen in September. Linnæus observes, that the leaves are the same size with those of the snow-drop. Native of the south of Europe. Cultivated in 1615, by Mr. John Parkinson. Mr. Miller says, it grows naturally in Slavonia and Sicily.

According to Mr. Salisbury, Linnæus confounded this with another species, which Jacquin has named *littorale*. Mr. S. names it *stellare*, and applies the synonyms of Miller in his figures and of Clusius which are given to *maritimum*, and of Seba which is attributed to *illyricum*. It grows wild on the sandy coast of the Isle of Rhe near Rochelle, according to Morison. It leafs in April, flowers in June, and the leaves wither at the end of August.

8. *Pancratium littorale*, or tall pancratium: spathe many-flowered, leaves lanceolate-linear bifarious, segments of the corolla linear, shorter than the tube; nectary almost linear; bulb the size of the fist; leaves ensiform, quite entire, acute, shining, spreading, deep-green, three or four feet long, scarcely an inch and a half in breadth, imbricate at the base and distich, embracing each other. Scape two to three feet high, very much compressed, an inch wide on one side, shining, green with a glaucous bloom, erect, or sometimes declining. Spathe ten-flowered or thereabouts: flowers seven to ten in a bunch, handsome, spreading, sessile at the top of the scape, having an agreeable aromatic odour. Found abundantly on the sandy coast of the island of Tierra Bomba near Carthagena, by Nic. Jos. Jacquin. In the Species Plantarum it is confounded with the *illyricum*, and hence has sometimes gone under that name.

9. *Pancratium verecundum*, or narcissus-leaved pancratium: spathe many-flowered, leaves linear, segments of the corolla lanceolate, shorter than the tube; the sinuses of the segments of the nectary stamiferous. Leaves a foot and a half long, half an inch wide. Scape erect, compressed, a foot high. Spathe oblong-lanceolate, acuminate, whitish, shrivelling; the outer larger, an inch and a half in length. Flowers fragrant, on three-cornered pedicels, scarcely half an inch long. Native of the East Indies. Cultivated in 1776, by Mrs. Theobald. It flowers from June to August.

10. *Pancratium Amboinense*, or Amboyna pancratium: spathe many-flowered, leaves ovate nerved petioled. Bulb oblong

PANCRATIUM.

Great West - Indian Pancratium.

Engraved for the Eng. and Am. Bot. Soc. 1820.

J. Busch del.

oblong, white, sending out several thick fleshy fibres, which strike downward. Leaves on very long footstalks, some ovate, others heart-shaped, about seven inches long and five broad, ending in points, having many deep longitudinal furrows; they are of a light-green, and their borders turn inwards. Stalk thick, round, and succulent, rising near two feet high, sustaining at the top several white flowers, shaped like those of the other sorts, but the petals are broader, the tube is shorter, and the stamens are not so long as the petals. There is a thin sheath, which splits open longitudinally. Native of Amboyna.

2. *P. Americanum* grows naturally in the islands of the West Indies, where it is called *white lily*. This has a pretty large bulb, a little flattened at the top, covered with a brown skin. Leaves near a foot and a half long, and little more than an inch broad, dark-green, and hollowed in the middle like the keel of a boat. Stalks near two feet high, thick, succulent, sustaining at the top eight or ten white flowers, shaped like those of *maritimum*, but of a purer white, and having a strong sweet odour, like that of balsam of Peru. The flowers seldom continue longer than three or four days, and in very hot weather not so long. When these fade, the germs, which are at the bottom of the tubes, turn to so many oblong bulbs, which are irregular in form, and, when ripe, drop off in the ground, where they put out fibres and become plants.

3. *P. latifolium* also grows naturally in the West Indies, where it is not distinguished from the preceding. This however differs from it, in the leaves being much longer and broader than that; for these are near two feet long, and more than three inches broad; hollowed like the keel of a boat, like the other. The flowers are larger, the petals longer, and the scent not so strong as that of the former. The roots flower in every season of the year. Cultivated by Mr. Miller in 1759.

7. Mr. Miller has added another sort in his last quarto edition of 1771, which he names *P. ovatum*. This also grows naturally in the West Indies; and has a large roundish bulb, from which arise several ovate leaves, about a foot long, and six inches broad in the middle, drawing to a point at both ends; they are of a deep green, and have many longitudinal furrows. The stalk is thick and succulent, a foot and a half high, sustaining at the top six or eight white flowers, of an agreeable sweet scent, smaller than those of the preceding (*Americanum*); the petals are narrower, the tubes shorter, and so are the spathe. Cultivated by Mr. Miller in 1771.

11. *Pancratium rotatum*, or large-crowned *pancratium*: sheath with few flowers; leaves linear; stamens between the jagged segments of the horizontal nectary. Native of Carolina, in the ground that is occasionally overflowed, from whence it was brought by the younger Michaux to Paris, and sent to Mr. Loddige before the year 1803. It flowers in the stove during most part of the summer, and increases greatly by offsets from the root. Leaves from half an inch to an inch wide. Flowers two, three, or more, with a segment of the sheath under each, white, nearly a span in diameter, from the great length of the linear channelled petals. The great flatness, and wide expansion, of the cup of the nectary, with its variously-jagged segments, between which the wide-spreading stamens, about twice its length, are attached, form the striking character of the present species, which Michaux in his *Flora* mistook for the Mexicanum.

12. *Pancratium calathinum*, or white Brazilian *pancratium*: sheath with few flowers; leaves linear; stamens between the jagged segments of the cup-shaped nectary, and scarcely exceeding them in length; tube nearly cylindrical. Native of the Brasils, from whence it was received by the late lady Amelia Hume in 1794. The leaves are obtuse, an inch wide, and two feet long. Flowers two or three from a sheath of as many or more divisions, white, very fragrant, somewhat drooping.

13. *Pancratium Anancaes*, or golden *pancratium*: sheath with few flowers; leaves lanceolate; stamens be-

tween the abrupt-toothed segments of the cup-shaped nectary, and about the same length; tube with six furrows. Native of Lima and Peru. Imported from the Brasils, in 1808, by Messrs. Middlemist and Wood at Shepherd's Bush, in whose stove it flowered in July 1809. This species is distinguished from all the preceding by the golden yellow of its flowers, which are described as exceedingly fragrant, and used by the Peruvian women to ornament their hair. The shape and size of the flowers most agree with the preceding. The leaves are more lanceolate, and broader, tapering to a point.

14. *Pancratium humile*, or small *pancratium*: sheath two-flowered; leaves thread-shaped; nectary cup-shaped, very short, in six obtuse cloven segments; stamens spreading, as long as the petals. Gathered by Cavanilles in Andalusia, flowering in October, before the leaves come out. These are two only, scarcely six inches long, very slender. Stalk not quite so tall, slender, thread-shaped, bearing two yellow flowers from one sheath, on unequal capillary stalks. This appears to us a very doubtful *Pancratium*; and, if the lobes themselves of the nectary do not bear the stamens, it ought to be removed to *NARCISSUS*.

15. *Pancratium speciosum*, or great West-Indian *pancratium*: sheath many-flowered; leaves elliptical; nectary with six teeth bearing the stamens; the intermediate ones simple, acute. Native of the West Indies, flowering in a stove most part of the summer. The leaves are of a very dark-green colour, from a foot and a half to two feet long, from three to four inches across the broadest part; in number uncertain, several fresh ones being produced each time the plant blooms, while the old ones do not decay in proportion, at least in our stoves. Scape rather shorter than the foliage, compressed, ancipital, streakletted; spathe two inches or more in length, light-green. Flowers pure white, nearly nine inches long, very ornamental, extremely fragrant, especially in the evening, retaining their scent for many months when dried. The cells of the germs in all the specimens we examined were dispermous, as in *P. amboinense*. We do not know a more desirable stove-plant than this. It is the finest of the whole genus, and most generally cultivated by those who have the means to make it bloom in perfection, which sometimes takes place twice in one summer. The four last species are from Curtis's Magazine: the present, which he calls "*balsam-scented sea-daffodil*," is represented on the annexed Plate.

Propagation and Culture. The sorts of the East and West Indies are too tender to thrive in England out of a good stove. If the pots be plunged in the bark-bed, they will thrive and flower very well. In the dry stove, their flowers will not be so strong, nor will they appear oftener than once a-year; whereas in the tan-bed, they will often flower two or three times. They are propagated by offsets from the roots, or by the bulbs which succeed the flowers. If the latter be planted in small pots filled with light earth from a kitchen-garden, and plunged into a moderate hot-bed, they will soon put out roots and leaves, and with care will become blowing roots in one year: if these are kept constantly in the tan-bed, they will put out offsets from the roots, and thrive as well as in their native countries.

7. This sort is hardy, and will thrive through the winter in the full ground; in very-severe seasons the surface should be covered with tanner's-bark, sea-coal ashes, straw, or pease-haulm. It is propagated either by offsets from the roots, or from seeds. The offsets will flower very strong the second year, whereas those which are raised from seeds seldom flower in less than five years. The roots should not be removed oftener than every third year, if they be expected to flower strong. The best time to transplant them is in the beginning of October, soon after their leaves decay. They should not be kept long out of the ground; for, as they do not lose their fibres every year, if these are dried, it greatly weakens the roots. It loves a light sandy soil, and a sheltered situation; the

the roots should be planted nine inches or a foot asunder every way, and five inches deep in the ground. If the plants are propagated by seeds, they should be sown in pots filled with light earth soon after they are ripe: these pots should be placed under a hot-bed frame in winter, but the glasses must be taken off every day in mild weather. For the other management, see NARCISsus.

PANCREAS, *f.* [*πᾶν*, and *κρεας*, flesh.] The *pancreas*, or sweet-bread, is a gland of the conglomerate sort, situated between the bottom of the stomach and the vertebræ of the loins: it lies across the abdomen, reaching from the liver to the spleen, and is strongly tied to the peritonæum, from which it receives its common membranes. It weighs commonly four or five ounces. It is about six fingers' breadth long, two broad, and one thick. Its substance is a little soft and supple. *Quincy.*

PANCREATIC, *adj.* Contained in the pancreas.—The bile is so acrid, that nature has furnished the *pancreatic* juice to temper its bitterness. *Arbuthnot.*

PANCREATIC JUICE, an insipid limpid juice, or humour, separated from the blood, and prepared in the pancreas. See ANATOMY, vol. i.

This juice is not acid, as most authors have supposed; nor alkaline, as some authors have thought; but a little saline, and much resembling the saliva in its origin, vessels, and properties. It is carried by the pancreatic duct into the duodenum, where it serves to dilute the chyle, to render it more fluid, and fit to enter the mouths of the lacteals; and perhaps to temper and dilute the bile, to change its viscosity, bitterness, colour, &c. and make it mix with the chyle, in order to reduce the several tastes, odours, and properties, of the several foods, into one homogeneous one. The duct is always found empty after death.

In the controversies about the nature of the pancreatic juice in the seventeenth century, numerous dogs were slaughtered without any very interesting results being obtained. De Graaf placed tubes in the pancreatic ducts of living dogs: phials were connected to the opposite end of them. In this way he collected two drachms, half an ounce, and even an ounce, in eight hours. Schuyt procured two and three drachms in two hours. (See De Graaf de Succo Pancreatici natura et usu; and Schuyt de Veteri Medicina.) Brunner attempted to cut out the gland, or to tie the duct, in dogs. (Experimenta nova circa Pancreas.) These tortures were inflicted in the attack and defence of a doctrine promulgated by Sylvius de Boe, and very generally adopted, that the pancreatic liquor was acid, and the bile alkaline, and that their mixture occasioned a fermentation in the stomach, by which chylification was effected! These notions were employed in explaining disease: the cold stage of fever was ascribed to the acid pancreatic juice, and alkaline remedies were ordered to correct it. After all, as we are ignorant of the quantity and exact nature of this secretion, we cannot be expected to explain what share it has in the changes which our food undergoes in the alimentary canal. *Haller's Elementa Physiologiae*, lib. 22. *Siebold's Historia Symplicis Salivæ*, 1797.

PANCSO'VA, a town and fortress of Hungary, on the north side of the Danube, in the bannat of Temesvar. In the year 1789, this town was burned by the Austrians, to prevent its affording a harbour to the Turks: eight miles north of Belgrade, and forty-three south-south-west of Temesvar. Lat. 45. 15. N. lon. 20. 16. E.

PANCTOU, a town of Thibet: seventy miles north-north-east of Lassa.

PAN'CY, or PANSY, *f.* [corrupted, I suppose, from *panaceæ*; *panacea*. *Dr. Johnson.*—It is the French *pensée*, as Dr. Johnson in a note on Hamlet admits; the name of the Viola tricolor. "It probably obtained the name of *pensée*, thought or fancy, from its fanciful appearance; the same circumstance which induced Milton to call it 'the pansy freak'd with jet,' that is, *fancifully touched with black.*" Nares's *Elem. of Orthoepey*, p. 305. *Todd.*]

A flower; a kind of violet.—There is *panfies*, that's for thoughts. *Shakespeare's Hamlet.*

From the brute beasts humanity I learn'd,
And in the *panfy's* life God's providence discern'd. *Harte.*
The daughters of the flood have search'd the mead
For violets pale, and cropp'd the poppy's head;
Pancies to please the sight, and cassia sweet to finell.

Dryden.

PAN'DA, in mythology, a goddess who was invoked and honoured as the protectress of travellers and navigators. The goddess of peace was also called *Panda*, because she opened the gates of cities which were shut in time of war. According to Varro, *Panda* is a surname of Ceres, derived à *pāne dando*, because she gave bread to mankind.

PAN'DA, a town on the north coast of the island of Cumbava. Lat. 8. 27. S. lon. 118. 48. E.

PANDACA'QUI, *f.* in botany. See CHIOCOCCA.

PANDÆMO'NIUM, *f.* [from the Gr. *πᾶν*, all, and *δαίμων*, a demon.] The great hall or council-chamber of the fallen angels. *Milton.*

PANDA'IA, or PANTAIA, a town on the north coast of the island of Cyprus, in a bay to which it gives name: twenty-eight miles west of Nicosia.

PANDANG', a town on the west coast of the island of Celebes. Lat. 3. 33. S. lon. 120. E.

PANDANG CO'CHIN, a town on the south-west coast of Sumatra. Lat. 4. 36. S. lon. 102. 57. E.

PANDANUS, *f.* [a name adopted by Linnæus from Rumphius, who fabricated it from the Malay *pandang*, which signifies "to behold," and which is supposed to allude either to the beauty of the tree in question, or to its conspicuous appearance at a distance.] In botany, a genus of the class diccia, order monandria. Generic characters—I. Male. Calyx: spathes alternate, sessile, serrate-spiny. Spadix decomposed, naked. Perianthium, proper none. Corolla: none. Stamina: filaments very many, solitary, placed scatteringly on the outer ramifications of the spadix, very short. Antheræ oblong, acute, erect. II. Female. Calyx: spathes four, terminating, converging. Spadix globular, covered with numerous fructifications, scarcely included; perianthium none. Corolla: none. Pistillum: germs numerous, aggregate, sessile, five-cornered, convex at top, smooth; style none; stigmas two, cordate, margined. Pericarpium: fruit sub-globular, large, consisting of numerous wedge-shaped drupes, convex at top, angular, farinaceous, one-seeded. Seed solitary, oval, even, in the centre of the drupe.—*Essential Character.* Calyx and corolla none. Male: Antheræ sessile, inserted into the ramifications of the spadix. Female: Stigmas two; fruit compound.

1. Pandanus odoratissimus, sweet-scented pandanus, or screw-pine: trunk throwing out runners; drupes obovate at the summit. The pandanus is generally in the form of a very large branching spreading bush; but now-and-then a plant may be found with a single and pretty-erect trunk of ten feet in height, and a branching round head. From the stems, or larger branches, issue large carrot-shaped blunt roots, descending till they come to the ground, and then dividing. The substance of the most solid is something like that of a cabbage-stalk, and by age acquires a woody hardness on the outside. Leaves confluent, stem-clasping, closely imbricated in three spiral rows, round the extremities of the branches, bowing, from three to five feet long, tapering to a very long fine triangular point, very smooth and glossy, margins and back armed with very fine sharp spines; those on the margins point forward, those of the back point sometimes one way, sometimes the other. The male flowers are in a large pendulous compound leafy raceme, the leaves of which are white, linear-oblong, pointed, and concave; in the axil of each, there is a single thyrs of simple small racemes of long-pointed dependent antheræ; they are not sessile, but raised from the rachis of the raceme by tapering

1. Fruit of the sweet scented Pandanus, or Screw Pine.
2, 3, 4. Common Scorpion fly. 5. Greek Scorpion fly.

pering filaments. The female flowers are on a different plant, terminating and solitary, having no other calyx or corolla than the termination of the three rows of leaves forming three imbricated fascicles of white floral leaves, like those of the male raceme, which stand at equal distances round the base of the young fruit. Germs numerous, collected in firm wedge-shaped angular bundles of from six to ten or more, forming the compound germs of the future drupes, closely impacted round the receptacle. The fruit is compound, oval, from five to eight inches in diameter, and from six to ten in length, weighing from four to eight pounds, rough, of a rich orange-colour composed of numerous wedge-shaped angular drupes; when ripe, their large or exterior ends are detached from one another, and covered with a firm deeper orange-coloured skin; apices flat, consisting of as many angular somewhat-convex tubercles as there are cells in the drupe, each crowned with the withered stigma internally; the exterior half of these drupes, next the apex, consists of dry spongy cavities, their lower part next the core or common receptacle is yellow, consisting of a rich-looking yellow pulp, intermixed with strong fibres; here the nut is lodged. This is compound, top-shaped, exceedingly hard, angular, containing as many cells as there are divisions on the apex of the drupe; each cell is perforated above and below. Seed single, oblong, smooth, adhering lengthwise to a small fascicle of strong white fibres, which pass through the perforation of the cell. By far the greater number of these cells are barren.

It is a native of the warmer parts of Asia. All soils and situations seem to suit it equally well: it flowers chiefly during the rainy season. This plant is much employed there for hedges, and answers well, but takes much room. It grows readily from branches, whence it is rare to find the full-grown ripe fruit. The tender white leaves of the flowers, chiefly those of the male, yield that most delightful fragrance for which they are so generally esteemed; and of all the perfumes it is by far the richest and most powerful. The lower yellow pulpy part of the drupe is sometimes eaten by the natives in times of scarcity and famine. The tender white base of the leaves is also eaten raw or boiled at such melancholy times. The taste of the pulpy part of the drupe is very disagreeable. The roots are composed of tough fibres, which basket-makers use to tie their work with; they are so soft and spongy as to serve the natives for corks; the leaves also are composed of longitudinal, tough, useful fibres. It is not cultivated in the East Indies with any other view than for fences. In the Supplement of the younger Linneus it is said, from Forkahl and Thunberg, to be cultivated for the sake of its fragrance. *Mugalie* is the Telinga name of the male plant, and *ghazangee* that of the female; *caldera* is the name they are known by amongst Europeans on the coast of Coromandel. The above account, and the representation (natural size) of the beautiful fruit of this species, are from Roxburgh's splendid work on the Plants of the Coast of Coromandel.

In the South-Sea islands, where the pandanus is also a native, this or some other species or variety is used for making mats. The leaves are beautifully white and glossy. In the Sandwich-islands these mats are handsomely worked in a variety of patterns, and stained of different colours. The branches being of a soft spongy juicy nature, cattle will eat them very well, when cut into small pieces. They call it *wharra-tree* at Otaheite, according to Hawkesworth. Forster says, that the fruit in Otaheite is called *vara*, and the male flowers *hinamio*; that it is fond of sandy coasts, and is found on almost all the islands of the southern ocean, within the tropics, even on those which are occasionally inundated; that it resembles the ananas in the fruit and leaves, and may be connected with the palms with more propriety than *Stratiotes* and *Vallisneria*; that it is cultivated in Arabia and Ceylon on account of the fragrantcy of the male flowers; that the women in India, especially on the islands, powder their

hair with the dust of the anthers, which is very fragrant, and that they lay up the floral leaves and bunches of flowers among their clothes; that in Ternate they dress the flowers before they open as sauce for flesh and fish; that in Banda they lay the leaves on wounds; that in India the fruit is eaten by elephants, in Otaheite and the neighbouring islands by children, and, when bread-fruit is scarce, even by grown persons; and that it has a fine aromatic scent like the strawberry or the pine-apple, a taste at first sweetish, but afterwards astringent and austere.

Forster mentions four varieties figured in the Hortus Malabaricus, t. 5, 6, 7, 8. and says that some varieties have no fragrance. Loureiro has distinguished two other species: *humilis*, Hort. Malab. t. 6. and *lavis*. Rumph. Amb. p. 147. We are by no means competent to unravel all the varieties, or rather species, of this plant, described by Rumphius and Rheede, but which succeeding botanical travellers have left unexplained. Mr. R. Brown has given definitions of the following two species, without any synonyms.

2. *Pandanus pedunculatus*: trunk throwing out runners; drupes conical and lobed at the summit, somewhat contracted at the base. Native of the tropical part of New Holland.

3. *Pandanus spiralis*: trunk without runners; drupes depressed and tessellated at the summit, very obtuse at the base. Gathered likewise by Mr. Brown in the same part of the world.

4. *Pandanus leram*, the Nicobar bread-fruit tree: trunk throwing out runners; pine-shaped. We have noticed the tree that bears this nutritive fruit under the article NICOBARS, vol. xvii. p. 63. It is very abundant in those islands, as well as in Carnicobar: it grows promiscuously in the woods, among other trees, but it delights, more particularly in a damp soil. The trunk is often straight, thirty or thirty-five feet high, and ten or twelve inches (the oldest even two feet) in circumference. The bark is smooth, ash-coloured, with equidistant intersections of a compact hard texture in its interior part, but soft and quite hollow in the centre from the top of the trunk; the leaves grow disposed like a calyx, about three feet long, and four inches broad, ensiform and aculeate, of a dark-green hue, and of a tenacious hard substance. The roots are out of the ground, and inserted at eight or ten feet on the trunk, according to its age, being not quite two feet in the earth. The fruit which has the shape of a pine, and the size of a large Jaca, comes out of the bottom of the leaves. The age of a man is seldom sufficient to see the trees bearing fruit: its weight forces it out of the leaves, and, when it is nearly ripe, which is known by the natives on the change of its colour from green to yellowish, it is gathered, and weighs from thirty to forty pounds. The drupes are loosened by thrusting a piece of iron between their interstices: the exterior surface is cut off, and thus put into earthen pots covered with leaves, then boiled on a slow fire for several hours together: the fruit is sufficiently boiled, when the medullary part of it becomes soft and friable; it is then taken from the fire and exposed to the cold air; when cold, the drupes are separated from the stalk, and the medullary part pressed out by means of a shell forced into them. Within the woody part of the drupes there are two seeds, in shape and taste much like almonds: the soft part is then collected into a spherical mass: and, in order to extract all the stringy fragments remaining in it by the compression of the shell, a thread is passed and repassed, until the whole is extracted, and it comes out perfectly clean: it is then of a pale-yellow colour, much resembling *polenta*, or the dressed meal of the Zea mays, and in taste much like it: when not newly prepared it has an acidity, to which it tends very strongly if long exposed to the atmosphere; but it may be preserved a long time, if well covered.

The Nicobar bread-fruit tree differs very essentially from the palm described by Mr. Masson, and found in the interior

parts of Africa, which bears a sort of bread-fruit. It differs also from the bread-tree found in Otaheite as already noticed. The Pandanus of the Coromandel coast, and of the Isle of France, where it thrives in some degree, never attains the height of this species; nor is the size of the fruit, though large, to be compared with it. It is called *larum*, or *leram*, by the natives; *cadhi* by the Arabs; and *cetaca* by the Indians. The flowers are celebrated in Sanscrit, by poets for their colour or scent, and by physicians for their medical virtues. *Asiatic Researches*, vol. iii.

PAN'DARISM, *f.* [from *pander*, which ought to be written *pandar*. See PANDER.] The employment of a pimp or pandar. *Sherwood*.—I need not tell you of bloody Turks, man-eating cannibals, Patavian *pandarism* of their own daughters, or of miserable Indians idolatrously adoring their devilish pagodes. *Bp. Hall's Character of Man*.

To PAN'DARIZE, *v. n.* To act the part of a pimp or pandar.

PAN'DAROUS, *adj.* Pimping; acting in the character of a bawd or pandar:

I know that face to be a strumpet's:
I saw her once before here, five days since 'tis;
And the same wary *pandarous* diligence
Was then bestowed on her. *Middleton's Witch*.

PAN'DARUS, a native of Crete, punished with death for being accessory to the theft of Tantalus. What this theft was is unknown. Some, however, suppose that Tantalus stole the ambrosia and the nectar from the tables of the gods, to which he had been admitted, or that he carried away a dog which watched Jupiter's temple in Crete, in which crime Pandarus was concerned, and for which he suffered. Pandarus had two daughters, Camiro and Clytia, who were also deprived of their mother by a sudden death, and left without friends or protectors. Venus had compassion upon them and she fed them with milk, honey, and wine: she wished to make their happiness more complete; and, when they were come to nubile years, she prayed Jupiter to grant them kind and tender husbands. But in her absence the Harpies carried away the virgins, and delivered them to the Eumenides to share the punishment which their father suffered. *Pindar*.

PAN'DARUS, a son of Lycaon, who assisted the Trojans in their war against the Greeks. He went to the war without a chariot, and therefore he generally fought on foot. He broke the truce which had been agreed upon between the Greeks and Trojans, and wounded Menelaus and Diomedes, and showed himself brave and unusually courageous. He was at last killed by Diomedes; and Æneas, who then carried him in his chariot, by attempting to revenge his death, nearly perished by the hand of the furious enemy. *Diclys Cret.* ii. 35. *Homer's Il.* ii. v. *Virg. Æn.* v.

PANDATA'RIA. See VENTOTIENE.

PANDE'ANS, [from *Pan*.] A title given to itinerant companies of Italian musicians, who perform on the syrinx or Pan's pipes of different pitches with their mouths, and accompany themselves on different instruments with their hands and feet. The lowest set of reeds (the *septem discrimina vocum* of Virgil) is called the *contra-basso*, or double-bass; the next *fagotto*, or bassoon; the third septenary is the tenor, or second treble; and the fourth, or highest range of pipes, the first treble; so that in the aggregate there is a complete scale of four octaves, and they can play in three or four parts. The instruments with which they accompany themselves with their hands are the cymbals, the triangle, the double drum beat at both ends, the mezza luna, a Turkish instrument, and the tambour de basque.

The reeds or pipes are fastened under the chin of the performer, and the lip of the player runs from one to the other with seeming facility, without moving the instru-

ment by manual assistance: (*Et supra calamos unco percurrere labro*, Lucretius.) The music which these people perform is very gay and pleasing. A company of them was introduced at Vauxhall-gardens a few years ago; and since that they are common enough in the streets of London. It is to be observed, that some of the performers, particularly the first treble, have more than seven pipes, which enables them to extend the melody beyond the septenary.

PAN'DECT, *f.* [*pandecta*, Lat.] A treatise that comprehends the whole of any science.—It were to be wished, that the commons would form a *pandect* of their power and privileges, to be confirmed by the entire legislative authority. *Swift*.

Thus thou, by means the ancients never took,
A *pandect* mak'st, and universal book.

Donne.

PANDECTS, the digest, or collection, made by Justinian's order, of 534 decisions or judgments of the ancient lawyers, on so many questions occurring in the civil law; to which that emperor gave the force and authority of law by an epistle prefixed to them. See the article LAW, vol. xii. p. 364.

The word is Greek, Πανδεκτα; compounded of παν, all, and δεχομαι, I take; q. d. a compilation, or a book containing all things. The Pandects consist of fifty books; and they were originally denoted by two ππ; but, the copyists taking those ππ for ff, the custom arose of quoting them by ff.

When the monuments of ancient Rome were neglected or destroyed by the envy or ignorance of the Greeks, the Pandects themselves escaped with difficulty and danger from the common wreck; and in the year 1137, a copy of them, which had been bought by an Amalfitan merchant from the east, fell into the hands of the Pisans. Angelus Politianus believes this copy to be that which had been compiled by order of the emperor. However that be, it is certain that all other copies are taken from it, as being the most ancient. The purchasers carried the volumes to Pisa, and for near three centuries they were known by the name of the *Pandectæ Pisanae*. But, about the year 1416, Pisa being taken by the Florentines, they were transported from thence to Florence, where they are now preserved in the library of the Medici, and known by the name of the *Pandectæ Florentinae*. They consist of two quarto volumes, with large margins, on a thin parchment; but the Latin characters betray the hand of a Greek scribe.

PANDEMIC, *adj.* [παν, and δημοσ, the people.] Incident to a whole people.—Those instances bring a consumption, under the notion of a *pandemic*, or endemic, or rather vernacular, disease to England. *Harvey on Consumptions*.

PANDE'MON, *f.* [Greek.] In antiquity, the same with the festival Chalceia and Athenæa. It was so called from the great concourse of "people" that used to meet at this solemnity.

PANDE'MUS, one of the surnames of the god of love, among the Egyptians and the Greeks, who distinguished two Cupids, one of whom was the vulgar called Pandemus, and another of a purer and more celestial origin. *Plut. in Erot*.

PAN'DER, *f.* [from *Pandarus*, the pimp in the story of Troilus and Cressida; it was therefore originally written, *pandar*, till its etymology was forgotten. See PANDARISM.] A pimp; a male bawd; a procurer; an agent for the lust or ill designs of another.—If ever you prove false to one another, since I have taken such pains to bring you together, let all pitiful goers-between be called *panders* after my name. *Shakespeare's Troilus and Cressida*.

Let him with his cap in hand,
Like a base *pander*, hold the chamber-door
Whilst by a slave
His daughter is contaminated.

Shakespeare.

The

The sons of happy punks, the *pander's* heir,
Are privileged
To clap the first, and rule the theatre. *Dryden.*
Thou hast confes'd thyself the conscious *pandar*
Of that pretended passion. *Dryden.*

My obedient honesty was made
The *pander* to thy lust and black ambition. *Rowe.*

To PANDER, *v. a.* To pimp; to be subservient to
lust or passion:

Proclaim no shame,
When the compulsive ardour gives the charge,
Since first itself as actively doth burn,
And reason *panders* will. *Shakespeare's Hamlet.*

To PANDER, *v. n.* To play the part of an agent for
the ill designs of another.—Excommunication serves for
nothing with them but to prog and *pander* for fees, and
display their pride. *Milton.*

PAND'EREN (Egbert), a Dutch engraver, was born
in 1606. He resided, during great part of his life, at
Antwerp, but he often added the word *Haerlemensis* to
his name, from which we may infer that he was a native
of Haerlem. He worked entirely with the graver, in
a stiff formal style; and his prints have neither harmony
of effect, nor correctness of drawing to recommend them.
The most worthy of notice is, "God, an Angel, a Man,
and the Devil; or, The History of Sickness and Medicine,"
from Henry Goltzius, in quarto, a very rare print.

PANDER'IFORM, or FIDDLE-SHAPED, *adj.* Leaves
shaped something like a fiddle, or ancient guitar.

PANDER'LA, a town of Hindoostan, in Madura:
thirty miles north-north-east of Coilpetta.

PANDER'LY, *adj.* Pimping; pimply.—Oh you *panderly*
rascals! there's a conspiracy against me. *Shakespeare's*
M. Wives.

PANDI PA'VEL, *f.* in botany. See MOMORDICA.

PANDIA, *f.* [Greek.] An Athenian festival in honour
of Jupiter. For the origin of this solemnity, see Potter's
Archæol. Græc. lib. ii. cap. 20.

PANDIC'ULATED, *adj.* [from *pandiculo*, Lat. 'to
stretch.] Stretched out; opened; extended.

PANDICULA'TION, *f.* [*pandiculans*, Lat.] The rest-
lessness, stretching, and uneasiness, that usually accom-
pany the cold fits of an intermitting fever.—Windy spi-
rits, for want of a due volatilization, produce in the nerves
a *pandiculation*, or oscitation or stupor, or cramp in the
muscles. *Floyer on the Humours.*

PANDI'ON, a king of Athens, son of Erichthon and
Pasithea, who succeeded his father B. C. 1437. He be-
came father of Procne and Philomela, Erechtheus and
Butes. During his reign there was such an abundance
of corn, wine, and oil, that it was publicly reported that
Bacchus and Minerva had personally visited Attica. He
waged a successful war against Labdacus, king of Boeotia,
and gave his daughter Procne in marriage to Tereus, king
of Thrace, who had assisted him. The treatment which
Philomela received from her brother-in-law, Tereus, (see
PHILCMELA,) was the source of infinite grief to Pandion,
and he died through excess of sorrow, after a reign of forty
years.

PANDIPOU'R, a town of Hindoostan, in Oude: twenty-
two miles south of Fyzabad.

PANDIT. See PUNDIT.

PANDOLY, a town of Hindoostan, in Baglana: twenty-
five miles north-west of Junere.

PANDON'SER, a town of Hindoostan, in Dowlatabad:
twenty miles east of Poorundar.

PANDOO', a town of Hindoostan in Visiapour: twenty
miles north of Sattarah.

PANDOOKAN', a small island in the Sooloo Archi-
pelago. Lat. 6. 15. N. lon. 120. 34. E.

PAND'ORA, a celebrated woman, the first mortal fe-
male that ever lived, according to Hesiod. She was made

of clay by Vulcan, at the command of Jupiter who wished
to punish the artifice of Prometheus by giving him a wife.
When this woman of clay had been made by the artist,
and received life, all the gods vied in making her pre-
sents: Venus gave her beauty and the art of pleasing;
Juno gave riches; Apollo taught her how to sing; Mer-
cury instructed her in eloquence; and Minerva gave her
wisdom. From all these valuable presents, which she
had received from the gods, the woman was called *Pan-
dora*, which intimates that she had received every neces-
sary gift. Jupiter after this gave her a beautiful box,
which she was ordered to present to the man who mar-
ried her; and, by the commission of the god, Mercury
conducted her to Prometheus. The artful mortal was sensi-
ble of the deceit; and, as he had always distrusted Jupiter, as
well as the rest of the gods, since he had stolen fire from the
sun to animate his man of clay, he sent away Pandora
without suffering himself to be captivated by her charms.
His brother Epimetheus was not possessed of the same
prudence and sagacity. He married Pandora; and, when
he opened the box which she presented to him, there is-
sued from it a multitude of evils and distempers, which
dispersed themselves all over the world, and which, from
that fatal moment, have never ceased to afflict the human
race. Hope was the only one who remained at the bot-
tom of the box; and it is she alone who has the wonder-
ful power of easing the labours of man, and of render-
ing his troubles and his sorrows less painful in life. *Hesiod's Theog.*

PANDORE, *f.* [from *Pandora*.] A woman endowed
with all perfections:

To frame the like *Pandore*

The gods repine, and nature would grow poor.

Fuimus Troes.

PANDORE, *f.* A musical instrument of the lute kind.
—The cythron, the *pandore*, and the theorbo, strike.
Drayton.

The word according to some, is formed from the Greek
παν and *δωρον*, i. e. all gifts, all sorts of gifts. *Isidore*
derives the name from its inventor Pandorus; others from
Pan, to whom they attribute this invention, as well as
that of the flute. It has the same number of strings with
the lute; but they are of brass, and of consequence give
a more agreeable sound than those of the lute. Its frets
are of copper, like those of the cistrum; its back is flat,
like that of the guitar: and the rims of its table, as well
as its ribs, are cut in semicircles. Du-Cange observes,
that Varro, *Isidore*, and others of the ancients, mention
it as having only three strings; whence it is sometimes
also spoken of under the denomination *trichordum*. The
instrument called the pandura, or bandora, of the lute
kind, was very much in favour in our own country dur-
ing the seventeenth century: but now, not only its scale,
but even its form, is forgotten.

PANDOSIA, in ancient geography, a town of Italy,
in Brutium, upon the west coast, near the sea, and the
boundaries of Leucania. It was founded by the Ceno-
trians, who made it the capital of their territory. It was
situated on a small mountain, at the foot of which ran
the stream called Acheron.—Also, a town of Epirus, in
the interior of the country.

PANDOURS, a corps of Hungarian infantry, in the
service of the emperor of Austria, and so called from Pan-
dur, a village in Lower Hungary, where they were first
raised by baron Trenck in the year 1741. They wear a
loose garment fixed tight to their bodies by a girdle, with
great sleeves, and large breeches hanging down to their
ankles. They use fire-arms, and are excellent marksmen:
they have also a kind of sabre near four feet long, which
they use with great dexterity.

PANDROSIA, a daughter of Cecrops, king of Athens,
sister to Aglauros and Herse. She was the only one of
the sisters who had not the fatal curiosity to open a ba-
sket which Minerva had entrusted to their care, (see ERICH-
THONIUS;)

THONUS;) for which sincerity a temple was raised to her, near that of Minerva, and a festival instituted in her honour. *Pausanias*.

PANDSA TA'LA, a group of several small lakes in Thibet. Lat. 30.42. N. lon. 79. 26. E.

PANDU', in mythology, the name of a personage of some importance in the heroic history of the Hindoos. He was the father of the "five brothers," or Pandavas, whose contests with the sons of Kuru form the subject of that splendid poem, the Mahabarat. To these five heroes, it is usual in India to attribute the construction of any great work whose origin is lost in its antiquity; such as the excavations on Elephanta, at Elora, &c. See MAHABARAT, vol. xiv.

PANDU'R, a mean Rascian village of Hungary, near Baja, remarkable for the activity of the heyducks against robbers infesting the roads, and from which the Pandours took their name: twenty-six miles south of Colocza.

PANDU'RA. See PANDORE.

PANDURIFORM, *adj.* An epithet applied to a leaf resembling in form the *pandura*, or ancient lyre, being rounded and dilated at each end, with a contraction in the middle. The form of the modern violin seems to have been borrowed from that instrument, though it does not clearly appear for what reason. The leaf so denominated is scarcely to be found but in the species of *Rumex*, called, from this resemblance, which is very correct and striking, *fiddle-dock*.

PANDUXA'TOR, *f.* (in old records.) A brewer.

PANDUXATRIX, *f.* A woman that brews and sells ale.

PANDYS'IA, *f.* [Greek.] In antiquity, public rejoicings when the season, through its coldness and intemperance, forced the sailors to stay at home.

PANE, *f.* [*paneau*, Fr.] A square of glass.—The face of Eleanor owes more to that single *pane* than to all the glasses she ever consulted. *Pope's Lett.*

The letters appeared reverse through the *pane*,
But in Stella's bright eyes they were plac'd right again.
Swift.

A piece mixed in variegated works with other pieces.—A *pane* of cloth. *Barret.*

Him all repute,
For his device in handfoming a suit,
To judge of lace, pink, *panes*, and print, and plait,
Of all the court to have the best conceit. *Donne.*

PA'NE, a town on the north coast of the island of Sumatra. Lat. 2.40. N. lon. 99. 35. E.

PA'NEAS, in ancient geography, the apparent spring from which the Jordan rises, on the extremity of the west side of the Trachonitis.

PA'NEAS, the name of a district adjoining to the spring Paneas, with a cognominal town, either enlarged and adorned, or originally built, by Philip son of Herod, and called *Casarea* by Josephus, and in St. Matthew *Casarea of Philip*; with a temple erected to Augustus his benefactor, who conferred the Trachonitis upon him. It was afterwards called *Neronias*, in honour of Nero (Josephus).

PA'NED, *adj.* Variegated; composed of small squares, as a *counterpane* usually is.—I have seen the king come sodainly thither in a maske with a dozen maskers, all in garments like shepards, made of fine cloathe of gold and fine crimson fatten *paned*. *Cavendish's Life of Wolsey*.—Altar-clothes of blew bawdkyn *paned* with red velvette. *Direct. in Warton's Life of Sir T. Pope*.—My hooded cloak, long stocking, and *pan'd* hose. *Masfingers Gr. Duke of Floreuce*.

PANEGYR'IC, *f.* [*panegyrique*, Fr. from *pannyrgis*, Gr.] An eulogy; an encomiastic piece.—The Athenians met at the sepulchres of those slain at Marathon, and there made *panegyrics* upon them. *Stillingfleet*.

To chafe our spleen when themes like these increase,
Shall *panegyric* reign, and censure cease. *Young.*

The word is formed of *παρ*, all, *αγειν*, I assemble; because anciently held in public and solemn assemblies of the Greeks, either at their games, their feasts, fairs, or religious meetings. To make their panegyrics the more solemn, the Greeks used to begin with the praises of the deity in whose honour the games, &c. were celebrated; then they descended to the praise of the people or country where they were celebrated; then to the princes or magistrates who presided at them; and at length to the champions, especially the conquerors, who had gained the prizes in them.

PANEGYR'ICUM, in church-history, an ecclesiastical book, used by the Greek church, containing the panegyric orations of various authors on the solemnities of Jesus Christ and the saints. It is found in MS. in most churches, but it is not the same in all; each church having its particular saints; and the compilers of this kind of books usually suited their collections to the taste of their own devotion. They are disposed according to the order of the months, and frequently consist of twelve volumes, answering to the twelve months of the year.

PANEGYRIC, or PANEGYRICAL, *adj.* Encomiastic; containing praise.—In *panegyric* halleluiahs. *Donne's Poems*.—Some of his odes are *panegyric*al, others moral, the rest jovial, or, if I may so call them, bacchanalian. *Dryden's Pref. to Sylva*.—In his *panegyric*al descriptions, he has seldom descended lower than the centre of their hearts. *Orrery on Swift*.

PANEGY'RIS, *f.* [Greek.] Among the ancient Greeks, a fair, or festival day, on which the people used to meet together. It exactly corresponded to the Nundinæ of the Romans. Hence any festival or public meeting. Milton follows the Greek form of the word *panegyry*.—After another persuasive method, at set and solemn *panegyrics*, in theatres, porches, or what other place or way. *Milton's Reas. of Ch. Gov.*—Rejoicing especially was the practice, on the more solemn and festival performances; at public sacrifice, which they called *panegyres*; a meeting of a side of a county, a province. *Stukely's Palæog. Sacra*.—Will there not open a glorious scene, when God (to use St. Paul's words) shall celebrate the grand *panegyris*? *Harris on Isaiah*.

PANEG'YRIST, *f.* One that writes praise; encomiast.—Add these few lines out of a far more ancient *panegyrist* in the time of Constantine the great. *Camden*.

To PANEG'YRIZE, *v. a.* To commend highly; to bestow great praise upon.—Is not our royal founder already *panegyri*zed by all the universities? *Evelyn*.—Their mode of *panegyri*zing their deceased benefactors seems rather to have been a kind of dramatic representation of their services, than a rhetorical description of them. *Coventry's Phil. to Hyd.*

PAN'EL, *f.* [*panellum*, Lat. *paneau*, Fr. a square or pane.] A square, or piece of any matter inserted between other bodies.—The chariot was all of cedar, save that the fore end had *panels* of sapphires, set in borders of gold. *Bacon*.—Maximilian, his whole history is digested into twenty-four square *panels* of sculpture in bas-relief. *Addison on Italy*.—This fellow will join you together, as they join waincot; then one of you will prove a shrunk *panel*, and, like green timber, warp. *Shakespeare's As you like it*.

A bungler thus, who scarce the nail can hit,
With driving wrong will make the *panel* split. *Swift*.

PANEL, in law. According to sir Edw. Coke *panella*, or *panellum*, denotes "a little part;" but Spelman derives it from *pagella*, a schedule or page; in which sense we say, a *panel* of parchment, a *counterpanel* or counterpart of an indenture, &c. Panel or *pannel* is more commonly used for a schedule, or roll, containing the names of such jurors as the sheriff returns to pass upon a trial; and *empannelling* a jury is nothing but the entering them into

the sheriff's roll or book. *Cowel*.—Then twelve of such as are indifferent, and are returned upon the principal *panel*, or the tales, are sworn to try the same, according to evidence. *Hale's Hist. of England*.

PANEL, in Scots law, signifies the prisoner at the bar, or person who takes his trial before the court of justiciary for some crime.

To PAN'EL, *v. a.* To form into panels: as, a *panelled* wainscot.—A very handsome bridge, the battlements neatly *panelled* with stone. *Pennant*.

PA'NELESS, *adj.* Wanting panes of glass:

How shall I sing the various ill that waits
The careful sonneteer? or who can paint
The shifts enormous that in vain he forms
To patch his *paneless* window?

Shenstone.

PANELLE'NIA, or PANHELLENIA, *f.* [Greek.] An ancient festival, celebrated by an assembly of people from all parts of Greece.

PANE'MUS, *f.* in chronology, the Bœotian name of the Athenian month Metagitmon, which was the second of their year, and answered to the latter part of our July and beginning of August.

PANEMUS, among the Corinthians, answered to the Attic month Boedromion, or, according to Petavius, to our November. In the ancient Macedonian calendar, it was the ninth month of the year: but, after the conquest of Arabia, they gave this name to the sixth month.

PANEPHY'SIS, in ancient geography, a town of Egypt, and capital of a nome, called by Ptolemy *Neut*.

PANERE, a town of the island of Ceylon: twenty-four miles north-north-east of Columbo.

PANETURE, a town of the island of Ceylon: eighteen miles south of Columbo.

PANEUS, a mountain of Syria, which formed part of Mount Libanus, and at the foot of which was situated a town of the same name.

PANG, *f.* [either from *pain*, or from *bang*, Dutch, uneasy.] Extreme pain; sudden paroxysm of torment.—See how-the *pangs* of death do make him grin! *Shakespeare*.

Ah! come not, write not, think not once of me,
Nor share one *pang* of all I felt for thee.

Pope.

To PANG, *v. a.* To torment cruelly.—A kind word, that would make another lover's heart dance for joy, *pangs* poor Will. *Addison's Lover*.

PANG'A, a town on the east coast of Celebes. Lat. 1. 54. S. lon. 121. 16. E.

PANG'A, a town of France, in the department of the Moselle, and chief place of a canton, in the district of Metz; containing 232 inhabitants.

PANGÆUS, a mountain of Thrace, anciently called Mons Caraminus, and joined to Mount Rhodope near the sources of the river Nestus. It was inhabited by four different nations. It was on this mountain that Lycurgus, the Thracian king, was torn to pieces; and that Orpheus called the attention of the wild beasts, and of the mountains and woods to listen to his song. It abounded in gold and silver mines.

PANGASI'NAN, a town on the west coast of the island of Luçon, and capital of a province or kingdom. Lat. 15. 40. N.

PANGAS'MAN, a small island in the Sooloo Archipelago. Lat. 6. 6. N. lon. 120. 58. E.

PANGESANA, an island in the Eastern Indian Sea, about forty-five miles in length, and nine in breadth, situated between the island of Celebes and Bouton. Lat. 5. 5. S. lon. 122. 50. E.

PANGIMODOO', a small island in the Southern Pacific Ocean, at the entrance of the harbour of Tongataboo.

PANG'KER, a town of the duchy of Holstein: three miles north-north west of Lutkenborg.

PANG'LO, or PANGEA'O, one of the smaller Philippine Islands: sixty miles north of Mindanao.

PANG'O, a town of Africa, capital of a province in Vol. XVIII. No. 1246.

the kingdom of Congo, on the Barbela: forty miles north of Congo Batta.

PANGOOTA'ARAN, an island in the Sooloo Archipelago, about ten miles long, and four broad. Lat. 6. 15. N. lon. 120. 28. E.

PANGUET, a small island in the Eastern Indian Sea, near the coast of Queda. Lat. 5. 50. N. lon. 100. 5. E.

PAN'GY, a town on the east coast of the island of Celebes, in Gunong Tellu Bay. Lat. 1. 6. S. lon. 120. 15. E.

PAN'JA, *f.* in botany. See BOMBAX.

PANJAB. See LAHORE.

PANJANG', an island in the Eastern Indian Sea, near the coast of Siam, about fourteen miles long, and six broad. Lat. 8. N. lon. 98. 42. E.

PANJANG', a small island in the Eastern Indian Sea, near the east coast of the island of Borneo. Lat. 2. 15. N. lon. 117. 59. E.

PANJANG', an island near the west coast of Siam, about forty miles in circumference. Lat. 8. N. lon. 98. 42. E.

PANJANG', a small island in the Pacific Ocean, near the north coast of New Guinea. Lat. 3. 18. S. lon. 135. 25. E.

PANIA'NY, a town of Hindoostan, in Calicut, where the Dutch have a factory. Near this place is a passage through the Gauts, about sixteen miles wide, and fifteen in length; occupied by forest-trees, and defended by the fortresses of Animaly and Palicaudcherry; and is the important pass from the Malabar coast to the Mysore dominions. In 1720, it was taken by the British troops under the command of Col. Hartley. It is fifty miles west of Palicaudcherry, and forty south of Calicut. Lat. 10. 42. N. lon. 75. 56. E.

PANJAPILLY, a town of Hindoostan, in Mysore: thirteen miles west-south-west of Caveripatam.

PANIASSAS, a town of Louisiana, on the Akanfas. Lat. 36. 25. N. lon. 94. 21. W.

PANIC, or PANICAL, *adj.* [from *Pan*, "lieutenant-general of Bacchus in his Indian expedition; where, being encompassed in a valley with an army of enemies far superior to them in number, he advised the god to order his men in the night to give a general shout, which so surprised the opposite army, that they immediately fled from their camp: whence it came to pass, that all sudden fears, impressed upon men's spirits without any just reason, were called, by the Greeks and Romans, *panic terrors*." Potter, from Polyænus's Stratagems. "The custom of shouting, to dismay an enemy, seems to have been used by almost all nations, barbarous as well as civil; and is mentioned by all writers who treat of martial affairs. Homer has several elegant descriptions of it, particularly one in the fourth Iliad. We have likewise had our war-whoops, and still have our shouts." *James's Mil. Dict.*] Violent without cause, applied to fear.—The sudden stir and *panical* fear, when chancicleer was carried away by reynard. *Camden's Rem.*—Which many respect to be but a *panic* terror, and men do fear, they justly know not what. *Brown's Vulg. Err.*

I left the city in a *panick* fright;
Lions they are in council, lambs in fight. *Dryden.*

PAN'IC, *f.* A sudden fright without cause.—There are many *panicks* in mankind, besides merely that of fear. *Ld. Shaftesbury.*

PAN'IC-GRASS. See PANICUM.

PANICASTRELLA. See CENCHRUS.

PAN'ICI EFFIGIE. See PANICUM.

PANICLE, *f.* [*panicula*, Lat.] In botany, a kind of inflorescence where the flowers are scattered on stalks variously and irregularly divided.—The distinction between a *panicle* and a spike is in all cases very great, but particularly important in the natural family of grasses, where it separates most of the genera into two grand sections. *New Cyclopædia.*

PANICOLO, a town of Naples, in Lavora: twenty-two miles north-west of Naples.

PANICULATE, or PANICULATED, *adj.* [from *panicula*.] Having flowers on long footstalks issuing on all sides from the middle stalk, and growing narrower towards the top.

PANICUM, *f.* [an old Latin name for the most celebrated species, *P. italicum*, and which Faber and Ambrosinus, after Pliny, declare to allude to its panicle of seed. Certainly the inflorescence of that grass, or corn, though now termed a spike, answers peculiarly well to the classical idea of a panicle. (See PANICLE.) Other etymologists deduce the word from *panis*, bread; for which, however, it seems to have served less than many other sorts of grain.] PANIC-GRASS, including MILLET; in botany, a genus of the class triandria, order digynia, natural order of graminæ, or grasses. Generic characters.—Calyx: glume two-flowered, two-valved: valves subovate, nerved: the outer valve a little lower, very small; one floret hermaphrodite, the other neuter or male. Corolla of the hermaphrodite; glume two-valved; the outer valve (in the bosom of the smaller calycine valve) flattish, nerved; the inner membranaceous, flat, with the edges bent in; often small or very small. Nectary two-leaved, very small, gibbous; in the neuter florets, none. Stamina: filaments three, capillary; antheræ oblong; the neuter florets have no stamens. Pistillum: in the hermaphrodites; germ roundish; styles two, capillary; stigmas feathered; in the neuters, none. Pericarpium: none; the corolla adheres to the seeds without opening. Seed one, covered, roundish, flattish on one side. Neglecting the inner valve of the neuter floret, the outer seems to belong to the calyx; hence three calycine valves are commonly reckoned by botanists, among which the third is very small.—*Essential Character.* Calyx two-valved, the third valve very small.

Panicum consists of thirty-four species only in Linn. Syst. Veg. ed. 14. Willdenow has eighty, having profited much by the labours of Retzius and Swartz; the former of whom has described many new species from the East, and the latter a considerable number from the West Indies. The new edition of Ait. Hort. Kew contains twenty-five species, all among those of Willdenow: five of them are natives of England. Only one new species, *P. cruciforme*, is defined in Smith's Prodr. Fl. Græc. Sibth. The whole are distributed by Linnæus, and consequently by Willdenow, into two sections, Flowers spiked, and Flowers panicled. The author last named has forty species in each section. Mr. Brown, however, who has defined thirty-two new species of Panicum, even as he limits the genus, from New Holland alone, has divided it, upon new principles, into seven sections. Of these, for want of knowing his new species, we can form no conclusive judgment; and we shall therefore content ourselves with the old arrangement.

I. Flowers spiked.

1. *Panicum polystachion*, or many-spiked panic-grass: spikes round, involucrets one-flowered, in bundles and bristly; culms erect, branched at top. In the spikes this resembles *P. glaucum*, but they are only half the size, and the pistils are blood-red. Culm rooting at bottom, from one to six feet in height, very much branched. Leaves hairy, at top almost opposite. Involucrets almost six times as long as their flowers, purple, with ciliate bristles from the base to the middle with longish hairs. Native of the East Indies. Biennial. Loureiro, however, describes the culm as annual, only two feet high, upright, slender, round, jointed. Native of Cochinchina.

2. *Panicum sericeum*, or silky panic-grass: spike round, involucrets bristle-shaped villose one-flowered the length of the flowers; leaves flat. This is an annual grass, native of the West Indies. It was introduced in 1780, by John earl of Bute; it flowers from June to September.

3. *Panicum verticillatum*, or rough panic-grass: spike

whorled, racemelets in fours, involucrets one-flowered, two-bristled, culms diffused. This in its general habit agrees exactly with *P. viride*; but, in the size and form of the spike, and the parts composing it, differs very materially: the whole plant is generally one-third larger; the spike also is larger, and much less compact; it is evidently composed of little branches, which grow somewhat in whorls, whence its name: the bristles of the spike are considerably shorter than those of the viride, and differ from them particularly in being hooked, so that the spikes readily adhere to any thing; and, where several of them grow near each other, they are very apt, from this cause, to become entangled. According to Linnæus, the spike is composed of longer racemes than in *P. viride*, three or four in number, directed one way downwards. Flowers green, with purple pistils. Bristles one or two, rugged, to each flower, and longer than that. Pedicels on the falling of the flowers terminated by a truncate, concave, white cup. Culms even, two feet high; spike from two inches and a half to four inches in length, and near half an inch broad. Native of Europe, the Levant, and Japan. In England, Mr. Ray describes it as having been found between Putney and Roehampton, and beyond the Neat-houses by the Thames side. Mr. Curtis found it sparingly in the gardener's-ground in Battersea-fields, with the viride, and flowering at the same time. Scheuchzer remarks, that it is a troublesome weed in the gardens near Paris. Thunberg describes two varieties, a larger and a smaller; the latter seeming to be distinct.

4. *Panicum helvolum*, or pale-red panic-grass: spike round, involucrets one-flowered, in bundles and bristly; seeds nerved. This is an annual grass, bearing a great resemblance to *P. glaucum*, but in reality different. Culm six feet high, branched; barren branches shorter. Leaves towards the base above with white hairs near an inch in length, and spreading. Spike simple, a span long. Involucrets pale-red, one-flowered, many-bristled, longer than the flower. Glume, with longitudinal streaks, (but no transverse waved ones,) green, distinct. Native of the East Indies.

5. *Panicum glaucum*, or glaucous panic-grass: spike round, involucrets two-flowered in bundles and hairy, seeds waved and wrinkled. Root fibrous, annual. Culms a foot high, erect, leafy, having four knots, grooved at the top, even. Leaves broadish, flat, even, the upper one often longer than the spike. Spike as in the next species: the florets disposed in rows, three times as large, subsessile, solitary and in pairs, accompanied by bristles, finally becoming yellow, shorter than in *P. viride*. Native of the East Indies, America, and several parts of Europe, as Italy, the south of France, Germany, Switzerland. It flowers in June and July. Introduced in 1771, by Mons. Richard.

6. *Panicum viride*, or green panic-grass: spike round, involucrets two-flowered in bundles and hairy, seeds nerved. This is distinct enough from the preceding in having smooth seeds, not transversely waved and wrinkled. The glumes are nerved, as in the preceding. Scopoli says, that the third glume is not always present; Leers, that it is always wanting.

Mr. Curtis remarks, that this species, to correspond with its trivial name, should be always green; but that its foliage is often red, and its spikes reddish-brown; and that the verticillatum is the contrary; but the spike will always distinguish them. The hairs in the spike of the viride are much longer than those of the verticillatum; and, though the microscope discovers them to be prickly, yet, being upright, they show no manifest roughness.

Leers thus describes it. Root annual. Culms from a foot to eighteen inches in height, oblique, leafy, having three knots, streaked at top, rugged. Spike ovate-cylindrical, unequal in thickness, green, frequently tinged with violet on one side. The third petal of the corolla is found in the preceding, in *crus galli* and *miliaceum*, but not

not in this. According to Mr. Curtis, the calyx has three valves, two of which are opposite, equal, ovate, obtuse, ribbed; the third very minute, and placed below the others: the corolla has two valves, which are ovate, hollow, thinning, and nearly equal. He observes, that sparrows are remarkably fond of the seeds; and that the whole of this genus, when cultivated in a garden, require to be protected from them. Native of Europe, as Germany, Carniola, England. With us not common, though the most common of the panicums. In Battersea-fields, near London; by Martha's chapel, near Guildford in Surrey; and in the gravel-pits by Chippenham-park, Cambridge-shire, and the corn-fields adjoining. It flowers in July and August, and is an annual grass of no use in cultivation.

7. *Panicum Germanicum*, or German panic-grass: spike compound, close; spikelets glomerate; involucrets bristle-shaped, longer than the flower; rachis hirsute. This has been confounded with the next species, from which it is distinct, in having the spike not interrupted at the base, smaller and ovate; in the height of the culm; in the shortness of the involucrets; and in having the rachis hirsute. Mr. Miller says, it rises with a jointed reed-like stalk about three feet high, and about the size of the common reed; with a leaf at each joint a foot and a half long, and about an inch broad at the base where broadest, ending in an acute point, rough to the touch, embracing the stalk at the base, and turning downwards about half the length. The stalks are terminated by compact spikes, about the thickness of a man's finger at bottom, growing taper towards the top, eight or nine inches long, closely set with small roundish grain like that of millet. It is annual, and perishes soon after the seeds are ripe. There are three varieties of it, with yellow, white, and purple, grains. It has been formerly cultivated for bread, in some of the northern countries; but is not so much esteemed as the Italian sort; since, however, it will ripen better in a cold climate than that, it is generally cultivated where a better sort of grain will not succeed: neither of them are reckoned to afford so good nourishment as millet. Native of the southern part of Europe.

8. *Involucrets shorter than the flower*. Willdenow says, that he has frequently received the seeds of this variety under the name of *P. indicum* and *sibiricum*; that it approaches in habit to *P. verticillatum*, on account of the very short involucrets, sometimes scarcely visible without tearing the spikelets in pieces; but that it differs very much in the hairiness of the rachis, which in *P. verticillatum* is smooth.

9. *Panicum Italicum*, or Italian panic-grass: spike compound, with the base interrupted, nodding; spikelets glomerate; involucrets bristle-shaped, much longer than the flower; rachis tomentose. Culm annual, from a foot and a half to near four feet high, and much thicker than that of the preceding; the leaves are also broader. The spikes are a foot long, and twice the thickness of those of the former, but not so compact, being composed of several roundish clustered spikes; the grain is also larger. There are two or three varieties of this differing only in the colour of the grain. It is frequently cultivated in Italy (whence its trivial name) and other warm countries. It is a native of both Indies, and of CochinChina; and was cultivated by Mr. Miller in 1739. It flowers in July and August.

10. *Panicum setosum*, or bristly panic-grass: spike compound, spikelets panicle-fascicled, bristles mixed with the florets and very long, peduncles almost smooth. Height from two to four feet. Culm simple, erect, round, smooth, leafy. Leaves half a foot long, lanceolate, flat, entire, pubescent; sheaths embracing the culm, villose at the neck. Spike terminating, compound, a foot long, composed of panicle-fascicled racemes half an inch in length. Spikelets two to four, clustered, pedicelled, unequal, mixed with bristles, green. It approaches near to *P.*

Italicum; but in that the spikelets are glomerate, on hirsute pedicels.

11. *Panicum lanceolatum*, or spear-leaved panic-grass: spikes alternate, outer valve of the calyxes ciliate and awned, leaves lanceolate. Culms simple, decumbent, leafy, rooting, long. Leaves naked, nerved, with very fine lines between the nerves, ciliate at the base. Spike composed of alternate spikelets an inch long. Flowers directed one way, alternately in pairs, on a flexuose three-cornered rachis, one larger, both awned, sometimes, but seldom, on the lower part of the spike, solitary; all green. Native of the East Indies, whence it was sent by Koenig.

12. *Panicum stagninum*, or pond panic-grass: spikes alternate, directed one way; calyxes two-flowered, awned, hispid. Culms erect, three feet high, leafy. Spike compound, half a foot long. Spikelets an inch and a half in length; flowers in pairs and solitary, rather large. Native of the East Indies, in ponds. Found by Koenig.

13. *Panicum crus corvi*, or crow-foot panic-grass: spikes alternate, directed one way; spikelets subdivided; glumes sometimes awned, hispid; rachis three-cornered. Culm annual, two feet high, suberect, manifold, jointed, leafy. All the florets hermaphrodite. Though Loureiro describes it under the name of *crus corvi*, he observes that it is intermediate between that and *crus galli*, and different from both. Linnæus remarks, that it resembles the next species very much, but that it is less and more tender; the panicle more nodding, with a three-cornered (not five-cornered) rachis; the flowers on the spike are directed one way, and not incumbent all round on the rachis. Native of the East Indies, CochinChina, and Japan. Introduced in 1781 by Monf. Thouin. It flowers in July and August.

14. *Panicum crus galli*, or thick-spiked cock's-foot panic-grass: spikes alternate and conjugate; spikelets subdivided; glumes awned, hispid; rachis five-cornered. Root annual. Culms several, from one to two feet in height, thick, at first procumbent or oblique, but finally almost upright. Flowering-branches leafy, naked at top, even. Leaves on the culm very wide, flat, even on both sides, hispid at the edges. Instead of a ligule, a short triangular membrane, adnate, dusky. Sheaths loose, compressed a little, cloven, even; the lower ones acute, leafless. General rachis linear, flattish, rugged, with one angle underneath, scarcely projecting, two at the sides sharper, and one above, with a groove for the insertion of the branches. Partial rachis three-cornered, somewhat flexuose, subdivided, involucred at the base with whitish hairs in bundles. Florets clustered, directed one way, on very short subdivided peduncles, with bundles of hairs at the base. Calyx nerved, pubescent, rugged; two of the valves mucronate, and the third flat and awned; the awn terminating, rugged, straight, short.

Mr. Curtis remarks, that the leaves in more humble plants are three or four inches long, and from two to three lines in breadth; in taller plants six inches or nearly a foot in length, four lines and sometimes six or seven broad, tapering to a point, keeled, smooth, the edges very finely toothed, and about the mouth of the sheath hairy. Spikes pale-green, sometimes varying to purple. Spikelets often twelve in number, thick, roundish, the lowermost an inch and a half in length, longer and farther asunder than any of the rest. Seeds rather large, shining, covered by the valves of the corolla, round on one side, and flat on the other. These seeds being large and plentiful, this grass is much sought after by small birds. Native of Virginia, the Cape of Good Hope, and several parts of Europe, as Sweden, Germany, Switzerland, the south of France, and in England. Thomas Willifell found it in a garden between Deptford and Greenwich; with a smooth spike, in a lane near the Neat-house gardens; with an awned spike, by the rivulet-side near Petersfield, Hampshire, by Mr. Goodyer. Mr. Hudson describes it as growing by Martha's Chapel near Guildford.

Guildford. Dr. Milne found it in a coppice near Purfleet; and Mr. Curtis observed it in Battersea-fields. He has figured it without any awns, in which state it most frequently occurs with us. Leers remarks, that the florets are scarcely awned in cultivated grounds, but that in wet places it is found with very long awns. Linnæus says, that the latter, β , with awns ten times as long as the glumes, differs manifestly from the common sort, in which the awns are scarcely half as long again as the glumes.

14. *Panicum setigerum*, or bristle-bearing panic-grafs: spikes remote; florets directed one way; teeth of the rachis bristle-bearing. Culms filiform, branched, leafy. Leaves two inches long, subcordate at the base, with the edges of the sheaths ciliate. Flowers directed one way, in pairs, really sessile, one of them placed higher than the other. Native of China, whence it was sent by Bladh.

Retzius is of opinion, that *P. repens* of Burmann, Ind. 26. t. 11. f. 1. is not the *repens* of Linnæus, nor the *grossarium*, but this species.

15. *Panicum colonum*, or purple panic-grafs: spikes alternate, directed one way, awnless, ovate, rugged; rachis roundish. Root annual. Culms a span high, round, ascending. Native of the East Indies. Cultivated in 1699 by the dukes of Beaufort. It flowers in July and August.

16. *Panicum fluitans*, or floating panic-grafs: spikes alternate, sessile, directed one way; the third calycine valve minute. This is a very beautiful smooth even grafs. It differs from *P. brizoides*, which it resembles very much, in having the two valves of the calyx of the same length with the corolla, the accessory valve only short and refuse: both have the appearance of a *Paspalum*. Native of the East Indies, Arabia, and Madagascar.

17. *Panicum brizoides*, or briza-like panic-grafs: spikes alternate, sessile, directed one way; two of the calycine valves much shorter than the corolla, and refuse; the third the same length with the corolla. Native of the East Indies.

Swartz describes a grafs of Jamaica under this name, but it may be doubted whether it is the same species. Culm from one to three feet high, simple, round, even. Leaves broadish, not long, acute, erect, rugged at the edge, striated, sheathing at the base; the neck beardless. Rachis terminating, almost a foot long, simple, linear. Stigmas purple. Seed fastened to the corolla, roundish.

18. *Panicum eruciforme*, or caterpillar panic-grafs: spike compound; its branches alternate, erect, close-pressed, linear, hairy; flowers crowded, turned to one side, without awns; stems branched from the bottom. Discovered by Dr. Sibthorp in fields about the temple of Juno, in the island of Samos. Differs from the last in having a slender hairy stem, branched from the bottom, with numerous bent joints; leaves short and spreading; branches of the spike more slender, linear, and hairy; glumes less tumid, and the outermost valve of the calyx much more minute.

19. *Panicum flavidum*, or yellowish panic-grafs: culm leafy; spikelets remote, sessile, pressed close, directed one way, few-flowered. This is an upright grafs, from two inches to half a foot in height. Root fibrous, the fibres undivided. Culms several, erect, clothed with smooth leaves to the very lowest spike. Spikelets from three to seven, short, commonly six-flowered, erect, sessile, pressed close, three quarters of an inch distant from each other. Flowers globular, alternate, directed one way, yellow with green nerves; all the glumes of the calyx violet-coloured at the tip. It is very nearly allied to *P. brizoides*, which however is larger, green, and has longer leaves, with sheaths relatively narrower. The spikelets have as far as thirteen ovate white unspotted florets. Native of Ceylon, whence it was sent by Koenig.

20. *Panicum dimidiatum*, or half-spiked panic-grafs: spike halved, and directed one way; spikelets five-flowered; alternately pressed to the hollowed rachis. Culm ten feet

high, very finely striated, ascending. Leaves at the base of the culm distichally alternate, three inches long, on the middle of the culm one; all linear, blunt. Spike terminating, linear, three inches long, as it were halved. Rachis dilated, membranaceous, jointed, at the joints alternately deeply gashed, excavated alternately in front for the spikelets. Spikelets five-flowered, glued as it were in the hollow of the rachis, sessile, with the partial rachis flexuose. Flowers awl-shaped, sessile, striated, flat in front, gibbous behind. Calyx three-valved, one-flowered; outer valve cartilaginous, flat, with the sides bent at a right angle, lanceolate, streaked; inner equal in length, thinner, boat-form, gibbous, rounded and striated at the back, ciliate-bearded at the tip, involving the edges of the outer valve; accessory valve short, truncated, at the base of the outer valve. Corolla equal in length to the calyx, but narrower. This is the *P. dimidiatum* of Linnæus, very different from that grafs which the younger Linnæus made a species of *Rottbollia*. Native of the East Indies, where it was found by Koenig.

21. *Panicum Burmanni*, or wave-leaved panic-grafs: spikes mostly four, remote, directed one way, simple; the two outer glumes of the flowers awned. This is very different from *P. hirtellum* of Linnæus. Culm decumbent, branched, villose, and rooting at the base. Spikelets four to three. Rachis clothed with long hairs, especially under the pedicels. Florets alternate, commonly abortive. Corolla snow-white, very smooth. Native of the East Indies, whence it was sent by Koenig; also of Italy.

22. *Panicum hirtellum*, rough-haired panic-grafs, or Scotch grafs: spike compound; spikelets pressed close, alternate; calyxes doubled; all the valves awned, outer longest. Culm creeping, ascending, three inches to a foot. The smaller leaves waved, the larger stiff. Spike compound. Spikelets directed one way. Three valves of the calyx almost equal; the fourth, which is inmost, minute, membranaceous, awnless. The awns of the others long, (five times as long as the valve in the outmost,) ferruginous-red, glutinous; according to Linnæus, filiform, blunt, finally hooked. Antheræ whitish; stigmas feathered, long, blood-red. Native of the West Indies. This grafs is cultivated, and thrives very luxuriantly, in all the low and marshy lands of Jamaica, where it is almost universally used as fodder for all their stabled cattle: it is planted near the towns with great care, and found to be one of the most beneficial productions of the island. Its general growth is from two to four feet.

23. *Panicum pilosum*, or hairy panic-grafs: spikes panicled, alternate, directed one way; spikelets in pairs, one smaller, acuminate, even; rachis compressed, hairy; culm divaricate, jointed. Culm three or four feet high, branched, compressed, even: joints villose, large. Leaves lanceolate, acute, even, rugged at the edge. Native of Jamaica, and other islands in the West Indies, in woody mountainous pastures.

24. *Panicum molle*, or soft panic-grafs: spikes panicled, alternate, directed one way, spreading; spikelets approximating, pedicelled, directed one way, awnless. Culm from two to three feet high, decumbent at the base, ascending, subdivided at bottom, jointed, round, thick, pubescent. Leaves long, broad-lanceolate, rounded at the base, flat, villose, soft. Valves of the corolla in the hermaphrodite florets nearly equal, ovate; one flatter. Antheræ very dark purple; stigmas the same, and villose. Seed oblong, shining. Valves of the neuter corolla unequal: outer ovate, striated, brown; inner flat, whitish, minute. It is known immediately from the other species by its softness. The culms being thick and succulent, it is very grateful to cattle. Swartz says that it is a native of Surinam, and is commonly called *Dutch-grafs* in Jamaica, where it grows in moistish fertile pastures.

25. *Panicum fasciculatum*, or fascicled panic-grafs: spikes panicled, alternate, erect, subfastigate; spikelets directed

directed one way, roundish. Height two or three feet. Culm jointed, erect, round, leafy, smooth. Leaves a foot long, rounded at the base, broad-lanceolate, acute, streaked longitudinally, rough at the edge: sheaths long, striated, smooth, subvillose at the edge and neck. Spikes terminating, half a foot long, subverticillate. Florets roundish or ovate, small, brown. Outer valve of the calyx one third of the size of the other: inner ovate, concave, marked with longitudinal lines, appearing netted when magnified, ferruginous-brown. Valves of the hermaphrodite corolla ovate, whitish; one smaller, included. Male corolla empty: outer valve like the inner valve of the calyx; inner smaller, whitish, ovate. Native of Jamaica, in low grassy places.

26. *Panicum Carthaginense*, or *Carthagera panic-grafs*: spikes panicled; leaves shorter; spikelets directed one way, roundish. Roots long, filiform, stiff, perennial. Culm a foot high, very much branched, jointed, prostrate, compressed a little, grooved, stiff, smooth. Branches from the sheaths of the leaves, in bundles. Leaves rounded at the base, lanceolate, acuminate, two or three inches long, flat, entire, sometimes waved at the edge, striated a little, smooth: sheaths longer than the leaves, wide, longitudinally open, striated, pubescent, very much contracted at the edge and neck, subvillose. Spikes on every side terminating the branches, commonly shorter than the leaves, an inch long, frequently concealed in the sheaths. Native of Carthagera in South America in grassy places.

27. *Panicum conglomeratum*, or conglomerate panic-grafs: spike directed one way, subovate; florets blunt. It is thus described by Linnæus, in his *Mantissa*, under the name of *P. indicum*: "Culms filiform, prostrate, very much branched, rooting. Leaves lanceolate, even, with the sheaths shorter than half the internodes. Raceme terminating, peduncled, subspiked, small, shorter than the leaf, often eight-flowered, without hairs. Flowers alternate, sometimes two in the same tooth of the lower raceme, ovate. Pistils feathered, the size of the whole flower." Retzius describes it under the same name, as a filiform grafs, half a foot in height. Culm ascending, naked above. Spikes scarcely half an inch in length, without any involucrets. Inner valves of the calyx slightly hispid, almost equal, boat-shaped, acute: accessory valve blunt, minute. He can scarcely think it to be the *P. conglomeratum*, which seems to him to be the *Aira indica* of the *Species Plantarum*; for in *P. indicum* the spike is not directed one way, nor are the florets blunt. Native of the East Indies, by towns and in the streets: sent by Koenig.

28. *Panicum interruptum*, or broken-spiked panic-grafs: spike simple, interrupted; spikelets two-flowered, pedicelled, naked. This grafs is three feet high, and smooth. Knots of the culm black. Sheaths smooth. Leaves long, linear, striated, smooth. Spike a foot long, narrow. Flowers clustered. Peduncles one-flowered. Calyx two-flowered, two of the valves equal, acute, nerved; the accessory one less, obovate, obtuse, membranaceous. It differs from all the species in the inflorescence. Native of the East Indies, in stagnant waters.

29. *Panicum fanguinale*, or slender-spiked cock's-foot panic-grafs: spikes digitate, knobbed at the inner base; florets in pairs, awnless; sheaths of the leaves dotted. Root annual. Culms leafy, even, with three joints, at the two lower procumbent, the upper oblique; a foot high. Flowering-branches from the joints. Leaves two inches long. Sheaths somewhat compressed, blood-red, even, dotted. Rachis linear, subflexuose, flat, rugged, with a prominent nerve above, for the insertion of the florets; which, on the convex side, are pressed to the rachis, two together, or often three in each tooth: calyx awnless, pubescent: the third valve is flat, three-nerved, acute, sometimes violet-coloured; stigmas purple. Seed rufous, shining.

It is suspected that our *P. fanguinale* is not the same

with that of Linnæus. Mr. Curtis is induced to consider our plant as the sanguinale of Linnæus, rather by the figures and descriptions quoted by him, than by his specific distinction, which does not well accord with our plant; so that there yet remains a doubt whether our plant may not be the *P. filiforme* figured by Jacquin, *Obs.* 3. t. 70. It is observed by Miss Jennings of this grafs, that all the stems which lie near the ground take root; and by this means, though an annual and short-lived plant, it increases and spreads very wide. Heister, Haller, Scopoli, and Adanson, arrange this and some other species of *Panicum* under a distinct genus, which they call *Digitaria*, from the disposition of the spikes, like the fingers of the hand spread out. But, these having a three-leaved calyx, it seems better to continue them, with Linnæus, Schreber, &c. under the genus *Panicum*. This species is very universal; being found not only in Europe, but in Asia and America, and the Society Isles in the Southern Ocean: nevertheless it is not common in England. It grows at Elden in Suffolk, Witchingham in Norfolk, near Martha's Chapel by Guildford, Wandsworth-field, and in the gardener's grounds near Battersea: flowering from July to September. The name of *fanguinale* is not taken from its colour, but from an idle trick which the boys in Germany have of pricking one another's nostrils with the spikelets of this grafs till they draw blood.

30. *Panicum dactylon*, or fingered panic-grafs: spikes digitate, spreading; villose at the base on the inside; flowers solitary; runners creeping. Culm creeping at the base, and above that upright, nine inches or a foot in height, glaucous, smooth, frequently branched from the lower joints. Leaves keeled, acuminate, stiffish, from one to four inches in length, one or two lines in breadth, hirsute on both sides, somewhat rugged, glaucous. Sheath smooth with a yellow spot on each side at the insertion of the leaf. Joints purple, smooth, sometimes eight or nine. Spikes linear, four, five, or six, directed one way, three-sided, slightly hairy at the base, proceeding in a bundle from the top of the culm, at first purple, but by age acquiring the colour of chaff. Sometimes in the bundle of spikes a short branch springs forth, on the top of which is another bundle of spikes, few in number. The spikelets at first are pressed close to the scape; but in the time of flowering they recede in a vertical direction from it; and afterwards proximate to it again.

There is some little doubt whether ours be the exact plant characterised by Linnæus as the *P. dactylon*. Clusius's figure has long awns to the florets: but perhaps in the milder climates, of Spain and Italy the plant may be awned, though not so with us. In the figures of Bauhin, Morison, Monti, and Scheuchzer, there are no awns; and therefore they agree better with our plant. The hairs mentioned in the specific character, on the inside the base of the spikes, are not so evident in our specimens as to justify such an application; for, though our plants have some hairiness there, they have it at least as much on the outside, and still more in other parts. Native of Europe, the Levant, and the Cape of Good Hope. First found in England by Mr. Newton, between Penzance and Marazion in Cornwall; and lately again in the same place by Mr. Stackhouse. It flowers in July and August, till late in the autumn.

31. *Panicum umbrosum*, or shady panic-grafs: spikes about four, remote; florets in pairs, unequally pedicelled; culm creeping, flaccid. Culms filiform, a foot high, ascending, leafy, weak, putting out roots at the joints. Leaves linear-lanceolate, short, naked. Native of the East Indies, in shady grafs-spots: sent by Koenig.

32. *Panicum filiforme*, or filiform-spiked panic-grafs: spikes subdigitate, approximating, erect, filiform; rachis flexuose; teeth two-flowered, one sessile; inner valve very small; culm and leaves smooth; leaves lanceolate. Culms almost leafless, a foot high, filiform, at top naked, upright. Spikes slender, at first so close as to appear one, although

they are alternate. Native of North America, where it was found by Kalm. Also of Japan and the Cape of Good Hope, according to Thunberg; of the Society and Easter Islands. Introduced in 1781 by Monf. Thouin. It is an annual grass; flowering from July to September.

33. *Panicum Ægyptiacum*, or Egyptian panic-grass: spikes subdigitate, approximating, erect, filiform; rachis flexuose; teeth two-flowered; flowers pedicelled; inner valve three-nerved; culm and leaves hairy. Resembles the preceding very much, but differs in having the culm and leaves hairy, the spikes a little thicker, but especially in having the inner valve ovate, twice as large, and three-nerved: the accessory valve is extremely minute. It is an annual grass as well as the former. Culms from one to two feet high, covered with sheaths that have long hairs closely set. Its native place is not ascertained, notwithstanding its trivial name.

34. *Panicum ciliare*, or ciliated panic-grass: spikes subdigitate, approximating, erect, filiform; rachis flexuose; teeth two-flowered; flowers pedicelled; outer valve ciliate; culms and leaves hairy. Height a foot and a half, branched at the base. Outer glume of the calyx smaller, lanceolate; inner larger, the length of the corolla, hairy at both edges: the accessory valve is a scalelet scarcely observable, and often wanting. Corolla quite smooth. Flowers lanceolate, acute, one of them sessile. It varies with the leaves more or less hairy; and with the sheaths and joints hairy, and naked. This resembles *P. filiforme* so much, that they may easily be confounded: and perhaps, sanguinale, filiforme, Ægyptiacum, and ciliare, are nothing more than varieties. This species was brought from Java and China by Wennerberg.

35. *Panicum lineare*, or linear-spiked panic-grass: spikes digitate, in fours or thereabouts, linear; florets solitary, directed one way, awnless. Native of both Indies. Retzius says he had it from Koenig, with the culms branching very much, and leafy to the very spikes, with tender leaves; and from Thunberg, gathered at the Cape of Good Hope, with the culms creeping, less leafy at top, the leaves far more rigid, and the sheaths equitant in two rows. He doubts whether they are the same or different.

36. *Panicum cinicinum*, or bug panic-grass: panicle umbelled; racemes in fours; one of the calycine glumes ciliate; root annual. Culms a foot high, upright or ascending, even. Leaves lanceolate, even, ciliate. Flowers alternate: the outer flower falls entire with the seed, and on account of the hairs in some measure resembles a bug. Linnæus, not observing the glume which is received by the margin of that which is awned, but taking the smaller glume of the calyx for a glume of the corolla, made this grass a *Milium*. Koenig, who found it in the East Indies, first discovered it to be a *Panicum*.

37. *Panicum distachyon*, or distich-spiked panic-grass: spikes in pairs, directed one way. Culm somewhat branched, a foot high, narrower. Leaves short, rugged at the edge. Spikes two together, (according to Retzius commonly three, and sometimes four,) terminating, nearly equal. Flowers sessile in a double longitudinal row along the rachis, awnless, ovate, even; antheræ yellow; pistils feathered, purple. It has the appearance of *Paspalum distichum*; but the leaves are lanceolate and flat, not bristle-shaped and involuted; flowers sharpish, but not mucronate; the calyx has a short accessory valve, whereas there is none in *Paspalum*. Native of the East Indies, where it was found by Koenig.

38. *Panicum squarrosum*, or scaly panic-grass: spikes in pairs, horizontal; involucre of the flowers squarrose; culms decumbent. Culms prostrate, rooting, branched, leafy. Leaves short, clustered, tomentose, as are also the sheaths. Rachis membranaceous, dilated, flexuose, jointed; at each joint a bundle of two or three flowers, fenced with involucre or difform cartilaginous bractes: one valve of the calyx very large, ovate, acuminate, flexuose, the other smaller, lanceolate; both hard and cartilaginous

like the bractes; the accessory valve small, acute, under the larger. A bundle of barren flowers terminates the spike. The appearance and structure are so singular, that it seems to constitute a distinct genus. It has somewhat the appearance of a *Cenchrus*; and Linnæus placed it in that genus. Willdenow remarks, that the spikes are usually in pairs, but that there is only one in Linnæus's own specimen. Native of the East Indies. Annual. Frequent in the sands of Malabar during the rainy season.

39. *Panicum hispidulum*, or hispid panic-grass: spikes binate and ternate, erect; calyxes hispid, two-awned. This approaches nearest to *P. stagninum*, but is very different. The culms and leaves are the same as in that. Spikes compound, half a foot long, in clusters; spikelets scarcely an inch in length, almost pressed to the rachis, binate, ternate, or solitary. Outer valve of the calyx terminating in a naked awn four times as long as the flower; inner somewhat longer, terminated by a dagger-point, or short awn; both hispid, especially at the edge: the accessory valve short, from a wide base surrounding the pedicel, ending in a point, naked. Corolla as in *stagninum*, but acuminate and hermaphrodite: besides, between the corolla and that valve of the calyx which has the longer awn, there is a hyaline petal, as in *P. stagninum*; but in this there is no rudiment of stamens or pistil. Native of the East Indies; sent by Koenig.

40. *Panicum compositum*, or compound-spiked panic-grass: spike compound; spikelets linear, directed one way; florets in pairs, remote; calyxes awned. Culm creeping, leafy, rising, filiform, tender, simple. Leaves lanceolate, wider than in the rest, shorter. Spikelets four or five, alternate, remote, pressed to the rachis, growing on one side. Valves of the calyx lanceolate, slightly keeled, mucronate, with a straight awn, double the length of the florets, except the innermost, which has the awn shorter. Native of Ceylon; and the Society-isles in the Southern Ocean, according to Forster.

41. *Panicum elatius*, or tall panic-grass: spike compound, spikelets oblong scattered pressed close, florets crowded, calyxes mucronate-awned. This resembles the preceding very much. Culm upright, stiff, six feet high. Leaves long. It is an annual grass, native of Malabar.

II. Flowers panicled.

42. *Panicum dichotomum*, or dichotomous panic-grass: panicles simple, culm branched dichotomous. In stature this grass emulates a small tree, simple below, and fascicled above. Native of Virginia.

43. *Panicum ramosum*, or branched panic-grass: panicle with simple branches, flowers in threes or thereabouts, lower subsessile, culm branched. Culms a foot high, erect, branched, even; with the internodes thickish at the base, and knee-jointed. Native of the Indies.

44. *Panicum deustum*, or burnt panic-grass: panicle spreading, flowers solitary, glumes smooth, purple at the tip. Native of the Cape of Good Hope. Found there by Thunberg.

45. *Panicum coloratum*, or coloured panic-grass: panicle spreading, stamens and pistils coloured, culm branched, (quite simple, *Jacquin*.) Culms two feet high, very much branched, even, with the sheaths of the leaves hairy, and at length rugged. Panicle spreading very wide, loofish, with filiform branches. Glumes one-flowered, awnless, ovate, green and purple, eight-grooved; antheræ saffron-coloured, and pistils deep violet, by which it is readily distinguished from *P. capillare* and others. It is an annual grass, found by Forskahl near Cairo.

Jacquin describes the root as perennial, composed of thick long whitish fibres. Culms annual, several, aggregate, thickening at the base into a sort of bulb, and there connected and rooting; erect, round, smooth; not branched, as Linnæus says they are, but quite simple without the least branchlet, only connate immediately above the root. Leaves ensiform-linear, about ten inches in length,

length, four lines in width, acuminate, even, smooth, sometimes thinly haired below, loose, prominent underneath into a sharp midrib, sometimes flat, sometimes converging, cartilaginous, toothed at the edges, only to be discerned by the magnifier. Panicle spreading very much, filiform, branched, wide. Flowers scattered, solitary, on capillary pedicels, which are commonly pressed so close to the branchlets of the panicle as not to be discerned, so that the flowers appear to be sessile. Corolla whitish, pellucid, obtuse, nearly the size of the calyx; filaments white, purple at the tip; antheræ twin, oblong, yellow; stigmas feathered, purple. The seeds were sent from St. Domingo. It was introduced here as a native of Egypt in 1771, by Monf. Richard; and flowers in July and August.

46. *Panicum repens*, or creeping panic-grass: panicle rod-like, leaves divaricating. This is allied to the preceding. Culms creeping, a foot high, ascending. Lower leaves wider, covering the stem all over with their sheaths; spreading so much, that they are almost divaricate and reflex, mucronate; the sheaths subpubescent: the upper leaves are narrower, longer, erect. It is an annual grass, cultivated in the East Indies. It was introduced in 1777, by Patrick Ruffel, M. D. and flowers from July to September.

47. *Panicum Ischæmoides*, or white panic-grass: panicle erect contracted, calyxes two-flowered polygamous acute, culm simple, leaves distich rigid. Culms upright, quite simple, leafy. Leaves spreading, with the sheaths tomentose at the edge. The whole grass is whitish, and is taller than the other panics. It is very common in Malabar, on the borders of ponds: found by Koenig.

48. *Panicum remotum*, or distant panic-grass: branches of the panicle three-sided, florets subgeminat one pedicelled, culm branched four-cornered compressed. Culms two feet high and more, slender, four-cornered compressed, branching. Leaves linear, from four to six inches long, narrow, naked. Koenig sent this from Tranquebar.

49. *Panicum aristatum*, or awned panic-grass: culm creeping rooting, branches of the panicle undivided, florets in pairs sessile awned. Culm branched, creeping far and wide, putting out long and very simple fibres at the joints, thence rising straight, pubescent above the leaves, which are lanceolate, naked, and short. Wennerberg brought this from China.

50. *Panicum miliaceum*, or millet: panicle loose flaccid, sheaths of the leaves rough-haired, glumes mucronate nerved. Common millet rises with a reed-like channelled stalk, from three to four feet high: at every joint there is one reed-like leaf, joined on the top of the sheath, which embraces and covers that joint of the stalk below the leaf, and is clothed with soft hairs; the leaf has none, but has several small longitudinal furrows running parallel to the midrib. The stalk is terminated by a large loose panicle, hanging on one side. Loureiro describes the culm as annual; upright, thick, somewhat compressed and flexuose, hollow, jointed, branched. Leaves awl-shaped, largish, hairy, flat, reflex. Native of the East Indies, and China. In those countries, as also in the south of Europe, it is cultivated as an esculent grain. It varies in the colour of the seed.

β. *P. attenuatum*, has the panicle attenuated, the culm upright, the leaves lanceolate, the sheaths even and smooth. Gerard, in his Herbal, (1597,) says, "I have of it yearly in my garden."

Miller mentions two varieties, one with white, the other with black, seeds, but not differing in any other particular. He has also another species, which he names *Milium sparsum*. It was found at Vera Cruz by Houftoun, who called it *M. panicula ampla erecta sparsa*. It has a more slender stalk than common millet, about three feet high. The sheaths have no hairs, but are channelled. The leaves are shorter; the panicle stands erect, and the chaff has shorter awns or beards.

Loureiro mentions a variety with brownish or dusky

red seeds. Retzius describes the variety with black seeds (*Milium femine nigro*. Bauh. Pin. 26. and Mor. Hist. iii. 196. t. 5. f. 2.) Culm round, jointed almost upright, branched. Leaves a foot long, half an inch wide, hairy, with hispid sheaths: no ligule, but instead of it widish bristles. Flowers on each pedicel commonly two, sometimes one or three, pedicelled; sometimes, but very seldom, one sessile; corolla globular, hyaline; seed brownish-black.

51. *Panicum antidotale*, or medicinal panic-grass: panicle nodding, calyxes two-flowered polygamous acute; culm erect, very much branched. Root perennial, stoloniferous. Culms eight feet high and more, erect, branching very much. Leaves round at the edge, and on the larger nerves; edges of the sheaths bearded with bundles of whitish hairs like fringes. Panicle a foot long, branching very much. Pedicels two-flowered, so that one flower is subsessile on the pedicel of the other. Florets copious, green, round, acuminate; hermaphrodite floret two-petalled. Cultivated in Malabar, where it never produced seed, but is increased by offsets or runners; whence Koenig supposes it not to be a native, but to have been introduced from some other parts. The natives there use it, particularly in ulcers of the nose, and as a discutient in other cases, either simply bruised, or made into a cataplasm by boiling, as Koenig reports.

52. *Panicum notatum*, or black-spotted panic-grass: panicle spreading, axils marked, leaves lanceolate ciliate. This is a tall grass, with a slender culm and black knots. Leaves acuminate, very slightly hairy, five inches long, and three quarters of an inch wide. Panicle almost a foot long, with long branches spreading at an acute angle and rugged, spotted with black in the axils. Flowers scattered, solitary or in pairs, pedicelled, oblong, acute, small; the two inner glumes of the calyx equal, purple; the accessory valve a little shorter, whitish; all lanceolate. Corolla of the same length and shape with the calyx. Wennerberg gathered it in Sumatra.

53. *Panicum muricatum*, or muricated panic-grass: panicle spreading, flowers solitary muricated, culm rooting, ascending. Height a foot and a half. Culm filiform, decumbent at the base, rooting here and there. Leaves short, perfectly lanceolate, with white scattered hairs. Native of the East Indies; sent by Koenig.

54. *Panicum capillare*, or capillary panic-grass: panicle capillary erect spreading, peduncles strict, calyxes acuminate even, sheaths of the leaves very hirsute. This grass resembles *Poa capillaris*, but is entirely hirsute. It is three feet high, with a panicle more than a foot long, the peduncles and pedicels stiff and straight. Native of Virginia and Jamaica. Cultivated in 1758, by Mr. Miller. It is an annual grass; and flowers from June to August.

55. *Panicum flexuosum*, or flexuose panic-grass: panicle capillary spreading, peduncles flexuose, calyxes ovate, beard of the joints reflex. This has been confounded with the preceding. It is about a foot in height; culms decumbent, branched, slightly hairy. Leaves two inches long, narrow, hairy as are also the sheaths. Panicle scarcely three inches long, the whole of an ovate form, with the pedicels remarkably flexuose. Native of the East Indies.

β. *P. totum glabrum*. Retzius mentions a variety that is wholly smooth, found by Koenig every-where in the rice-fields.

56. *Panicum grossarium*: branches of the panicle simple, flowers in pairs with one of the pedicels very short, the other the length of the flower. Culm simple or branched, two feet high and more. Leaves ensiform, with ciliate sheaths. Native of Jamaica and Japan.

57. *Panicum maximum*, large panic-grass, or guinea-grass: panicle compound capillary spreading, branches racemed, knots of the joints and sheaths hirsute at the base. This is very nearly allied to *P. grossarium*. Root creeping, perennial; culms from five to ten feet high, upright, simple, even. Leaves lanceolate, towards the top convolute and sharp, smooth, except at the edge, which is

rugged, and at the base, which is rough-haired. Panicle erect, a foot long and more: the lower branches in whorls, the upper in pairs. Florets numerous, alternate, ovate-sharpish, pressed to the raceme, on short subflexuose pedicels. Instead of the hermaphrodite, there is often a female floret with a male at the side of it, or a female alone without the hermaphrodite and male. Seed oblong, shining. Native of the West Indies; said to have been brought from the coast of Africa. Guinea-grass is much esteemed in Jamaica, both for sheep and cattle; and flowers chiefly in October.

58. *Panicum nemorosum*, or wood panic-grass: panicle simple, branches distant erect, florets remote scattered ovate acuminate, culm decumbent jointed, sheaths and neck hairy. Height from one to two feet. Roots and radicles very long, filiform. Culm creeping at the base, ascending, somewhat branched, rooting at the joints, round, striated, pubescent or smooth, loose. Panicles small, erect, with terminating and axillary peduncles; branches short, few-flowered; florets pedicelled, small, green. The two valves of the corolla, in the hermaphrodite flower, are oblong, blunt, whitish; one of them smaller, and included; antheræ pale; stigmas feathered, whitish. In the male flower, the outer valve is ovate, acute, concave, and includes the inner, which is smaller, ovate, acute, and more tender; antheræ purple. Native of Jamaica and Hispaniola.

59. *Panicum acuminatum*, or sharp-leaved panic-grass: panicles simple shorter than the leaves, branches capillary diffused, spikelets remote obovate, culm decumbent jointed branched, leaves lanceolate-subulate erect, sheaths villose. This grass is a span in height. Culm creeping, but in a fertile soil erect, round, tomentose: branchlets ascending, short, about an inch in length, leafy, sheathed, jointed, tomentose-hirsute. Florets small, ovate, obtuse, on short waved pedicels. Valves of the hermaphrodite corolla ovate; antheræ purple; stigmas villose, dark purple, short; seed oblong, shining. In the male or neuter floret, the outer valve is like the inner calycine valve, ovate, striated; the inner is very small, flat, whitish. Native of Jamaica, on sandy fields in the mountains.

60. *Panicum rigidum*, or stiff-panicked panic-grass: panicle simple rigid spreading, culm branched decumbent, leaves horizontal rugged. Culm a foot high and more, decumbent, creeping a little, branched, jointed, sheathed, round, striated, smooth. Florets remote, ovate, minute. Glumes of the corolla, in the hermaphrodite florets, a little less than those of the calyx, more slender, whitish; antheræ ovate, largish, bifid, vertical, whitish-yellow; stigmas villose, long, recurved, whitish. In the neuter floret, the outer valve of the corolla is ovate and striated, the same size with the inner glume of the calyx: the inner valve is tender, less, whitish. This grass is distinguished by its rigidity. Native of Jamaica in the high mountains.

61. *Panicum fuscum*, or brown panic-grass: panicle simple, branches erect, florets directed one way in pairs, one on a shorter pedicel; culm erect subdivided, leaves broad-lanceolate. Height from one to two feet; culm jointed, round, pubescent. Leaves retuse and oblique at the base, entire, smooth, striated, three or four inches long. Panicles peduncled, an inch and more in length; peduncle long, filiform: florets brownish green, ovate. The rest as in *P. carthaginense*, which it resembles: but the culm is by no means branched, the sheaths are more contracted, the panicles peduncled, the florets in pairs, and the glumes ovate not acute. Native of Jamaica, in boggy pastures.

62. *Panicum laxum*, or loose panic-grass: panicle simple nodding, branches capillary, spikelets approximating alternate pressed close, culms simple filiform flaccid, leaves linear-lanceolate. Height from two to four feet; culm subdivided, compressed a little, striated, even. Leaves striated, even, spreading. Florets very minute, pedicelled, pressed close, approximating, ovate, bright green.

Valves of the corolla in the hermaphrodite floret equal, less than the calycine glumes, ovate, concave; antheræ yellowish; stigmas blood-red; seed roundish, shining, extremely small. In the neuter floret, the outer valve resembles that of the calyx. Native of Jamaica, in dry woods; flowering at the end of the year.

63. *Panicum latifolium*, or broad-leaved panic-grass: panicle with racemes lateral simple, leaves ovate-lanceolate hairy at the neck. Native of North America. Loureiro says that he found it in Cochinchina. He describes the culm as annual, thick, five feet high. Leaves lanceolate, large, plaited and grooved, with an embracing villose neck. Introduced 1765, by Mr. John Cree. It flowers in August and September; and is a perennial grass.

64. *Panicum flavescens*, or yellow panic-grass: panicle simple erect stiff, branches subfastigate, the lowest opposite, spikelets approximating directed one way, pedicels two-flowered. Height three or four feet. Culm simple, erect, round, at top compressed and pubescent. Florets pressed to the rachis, ovate, blunt, smooth, yellow. Valves of the hermaphrodite corolla ovate, concave; antheræ small, purple; stigmas villose, blood-red; seed oblong, shining, yellow. Outer valve of the neuter floret concave, ovate, striated: inner flat, more tender, whitish. This species is singular in the colour being constantly yellow, which is not the case in the rest. It occurs but rarely, in dry places in the southern parts of Jamaica.

65. *Panicum diffusum*, or diffused panic-grass: panicle somewhat simple capillary spreading, spikelets distant, culm decumbent simple, leaves linear, hairy at the neck. Culm a foot, sometimes two feet, in height, ascending, filiform, round, leafy, smooth. Leaves long, sharp, erect, striated, even. Sheaths striated, villose at the neck and throat. Glumes of the hermaphrodite corolla equal, less than the calyx, pellucid, whitish; antheræ purple; stigmas villose, blood-red; seeds roundish, yellow, shining. In the male floret, outer valve ovate, acute, smooth; inner minute, flat, whitish; filaments one to three, minute, barren. Common in dry places in the West Indies.

66. *Panicum oryzoides*, or rice-like panic-grass: panicle almost simple, branches erect, florets somewhat remote ovate acute, culm erect undivided, leaves broad-lanceolate rounded at the base, sheaths even. Culm three or four feet high, round, leafy, smooth. Leaves a span long, entire, longitudinally striated, smooth. Panicle a foot long: branches alternate, stiffer, angular, subflexuose, smooth. Spikelets smooth, pedicelled, commonly in pairs, one shorter than the other; and much larger than in any of the species. Native of Jamaica, in mountain-woods, in the southern parts.

67. *Panicum clandestinum*, or hidden panic-grass: racemes hidden within the sheaths of the leaves. Culms dichotomous, branched. Leaves ovate-lanceolate; with the sheaths dotted and hairy; the racemes of fructification are so entirely concealed within them, that no vestige appears on the outside; in other respects it is nearly allied to *P. latifolium*. Native of Pennsylvania, where it was found by Kalm.

68. *Panicum arborescens*, or tree panic-grass: stem very much branched, leaves ovate-oblong acuminate. This grass contends for height with the loftiest trees in the East Indies, where it is a native; and yet the culm is scarcely wider than a goose quill. In Linnaeus's *Flora Zeylanica* it is said to be creeping. Leaves embracing, even, wider in this grass, in proportion to its length, than in any other; hence the culm resembles that of *Commelina*. Introduced in 1776 by Mons. Thouin. It flowers here in March and April.

69. *Panicum curvatum*, or crooked-chaffed panic-grass: panicle racemed, glumes curved obtuse nerved. Native of the East Indies.

70. *Panicum virgatum*, or long-panicked panic-grass: panicle rod-like; glumes acuminate even, outmost gaping. This is a very tall grass, with a very large diffused panicle.

cle. Native of Virginia, and other parts of North America. Introduced in 1781, by Mr. William Curtis. It flowers in August and September.

71. *Panicum patens*, or spreading panic-grass: panicle oblong flexuose capillary spreading, calyxes two-flowered, leaves linear-lanceolate, culm rooting. Native of the East Indies. This, or one like it, is also found in Portugal.

72. *Panicum trigonum*, or triangular-seeded panic-grass: panicle erect, peduncles two-flowered, calyxes obtuse hispid one-flowered, seeds three-cornered. Culms a span high, prostrate, leafy, rooting. Leaves smooth, narrow. Native of the East Indies: found by Koenig.

73. *Panicum pallens*, or pale panic-grass: panicle compound ovate, branches clustered erect, spikelets ovate subulate, culm subdivided jointed, leaves ovate-lanceolate, sheaths ciliate on the neck and at the edge. Culm from one to two feet high, round, leafy, subdivided at the joints, grooved, striated. Native of Jamaica, among other grasses in woods.

74. *Panicum lanatum*, or woolly panic-grass: panicle compound erect smooth, spikelets ovate, culm branched, leaves ovate-lanceolate pubescent, sheaths lanuginose-hirsute. Culm a fathom in height at most, round, pubescent. Branches divaricating, leafy, hirsute. Leaves acuminate, half a foot long, spreading, striated, lanuginose-hirsute, soft. Panicles half a foot long, with spreading flexuose smooth branches. Native of Jamaica.

75. *Panicum arundinaceum*, or reedy panic-grass: panicle compound spreading, branches and branchlets stiff capillary, spikelets roundish, culm subdivided jointed, leaves broad-lanceolate acuminate rigid. Culm a fathom in height, erect, round, leafy, smooth. Native of Jamaica, in the high mountains near Coldspring in St. Andrew's parish.

76. *Panicum glutinosum*, or glutinous panic-grass: Panicle compound spreading, branches flexuose, spikelets pedicelled distant glutinous, culm erect simple, leaves broader. Culm three or four feet high, smooth, leafy. Leaves broad-lanceolate, an inch in breadth, more than a foot in length, acuminate, erect, rounded at the base, hairy, ciliate at the edge, marked with lines, smooth, somewhat rugged underneath. Panicle almost a foot long, erect. Native of Jamaica, in the southern parts, in the woods of the highest mountains. It is there called *ginger-grass*, on account of the width of the leaves. The great clamminess of the spikelets, whence its trivial name, is peculiar to this species.

77. *Panicum radicans*, or rooting panic-grass: panicle, culm branching rooting, the base of the leaves and the sheaths longitudinally ciliate. This grass is a foot high, slender, smooth. Culm leafy up to the panicle, decumbent, putting forth long, very simple, solitary, rooting fibres at the joints. Leaves linear-lanceolate, acute, an inch and a half in length, having long white hairs at the base on both edges. Panicle two inches long, slender, upright. Flowers small, peduncled, oblique, blunt, purple, naked. It resembles *P. trigonum*, even in the shape of the seed. Gathered near Canton in China, by Wennerberg.

78. *Panicum trichoides*, or hair-like panic-grass: panicle very much branched, spreading; branches and branchlets subdivided, capillary; culm declined, jointed; leaves ovate-lanceolate, very smooth. Culm one foot high to two feet, sometimes rooting, subdivided at the base, loose, round, smooth, leafy: knots approximating, smooth. Leaves acute, rounded and oblique at the base, entire, spreading, striated. On comparing several specimens of *P. brevifolium*, from the East Indies, with the Jamaica-grass, they do not appear to be distinct, although the latter is larger and more spreading, and with the glumes scarcely blunter. Calyxes in both two-flowered, and the leaves wider or narrower. Some other species have short leaves; and therefore Linnæus's trivial name

of *brevifolium* is a bad one: *trichoides* is very descriptive of the panicle in this species.

β. *Milium capillare* of Rottboell. Aft. Hafn. 1778. 271. which is *P. capillare* of Rolander, seems to be only a variety of this; the third calycine glume, of which those two authors deny the existence, is found in many of the spikelets, though extremely slender. All the parts are larger in this variety, except the spikelets, which are very small; the sheaths are very smooth, but the leaves are pubescent. Dr. Patrick Browne calls it *smaller wood-grass*, and says it is very common in the woods of Jamaica, agreeing for the most part with the Guinea-grass both in the arrangement and formation of its flowers. The stalk and leaves are excellent fodder for all sorts of cattle, and the seeds serve to feed small birds.

79. *Panicum divaricatum*, or straddling panic-grass: panicles short, awnless; culm very much branched and extremely divaricating; pedicels two flowered, one shorter. Native of Jamaica.

80. *Panicum hirsutum*, or shaggy panic-grass: panicle compound, capillary, spreading; culms and sheaths bristly-hirsute; leaves lanceolate, acuminate, nerved, strict. Culm four or five feet in height, simple, round, leafy. Leaves broadish, two feet long, erect. Sheaths close, grooved-striated. Panicle a foot long, erect. Spikelets pedicelled, somewhat remote, small, pale-green. Valves of the corolla in the hermaphrodite floret ovate, acute, white; antheræ purple; stigmas feathered, whitish. In the neuter, outer valve of the corolla like the inner of the calyx; inner more tender, whitish. It is very nearly allied to *P. maximum*, (Nº 57.) differing chiefly in its shagginess.

Swartz has another species from Jamaica, which he names *P. caespitosum*, very nearly allied to *grosularium*, (Nº 56.) but that has the culm more erect, large, and strict; the spikes panicle, more numerous and approximating; with clustered, larger spikelets.

Thunberg also has a species from the Cape of Good Hope, not enumerated above; *Panicum caudatum*, which he thus characterises: Panicle subspiked contracted or squeezed close, flowers solitary, glumes smooth, acute.

We are obliged to Retzius and Swartz for the greater part of the above species, which are natives either of the East or West Indies. The former has, in his second fasciculus, a species, which he names *P. Caffrorum*. It is called *Cafferhorn* at the Cape, and may be of the genus *Holcus*. In his fifth fasciculus, p. 18. Nº 34. he has *P. hispidulum*, sent by Koenig from the East Indies, which he says is nearly allied to *P. stagninum*, but is different from it. The corolla is acuminate and hermaphrodite; between the corolla and the long-awned valve of the calyx there is a hyaline petal, as in that; but in this there are no stamens, nor is there any rudiment of a pistil.

Propagation and Culture. 7, 8. The seeds of these sorts may be sown in the spring, at the same time as barley is sown; and may be managed exactly in the same way; but they should not be sown too thick, for these seeds are very small; and the plants grow stronger, therefore require more room. The German sort does not grow above three feet high, unless it is sown on very rich land, in which case it will rise to be four feet high; but the leaves and stems of this corn are very large, and therefore require to stand four or five inches apart, otherwise they will grow up weak, and come to little. These large-growing corns should be sown in drills at about eighteen inches apart, so that the ground may be hoed between the rows, to keep them clear from weeds, and the stirring of the ground will greatly improve the corn. In August the corn will ripen, when it may be cut down and dried, and then should be housed. The Italian panic grows much larger than the German, and produces much larger spikes; so this should be allowed more room to grow, otherwise it

will come to little. This is also later before it ripens, so it is not very proper for cold countries.

Most of the other sorts are natives of very warm countries, where some are used by the inhabitants to make bread. These grow very large, and require a good summer, otherwise they will not ripen in this country. The seeds should be sown the latter end of March, or the beginning of April, on a moderate hot-bed; and the plants should be planted out, when grown to a proper size, upon a bed of light rich earth, in a warm situation. They should be planted in rows about three feet asunder, and the plants must be kept clear from weeds. When the plants are grown pretty tall, they should be supported by stakes; otherwise the winds will break them down; and, when the corn begins to ripen, the birds must be kept from it, otherwise they will soon destroy it. These are preserved in some curious gardens for the sake of variety, but they are not worth cultivating for use in England.

22. Scotch-grass is propagated in Jamaica by the joints or root, and set in small drilled holes about two feet and a half asunder. The young shoots begin to appear in a few days; and, as they grow, they spread and creep along the ground, casting a few roots, and throwing out fresh shoots from every joint, as they run; these soon supply the land, and fill the field with standing plants, which alone are generally cut. It is fit to cut in six months from the first planting, and every month or six weeks after, if the season fall in kindly, and due care be taken to keep the ground free from weeds. An acre of good ground, well stocked with this grass, near Kingston or Spanish-town, is computed to bring in above 120*l.* a year; and when once planted holds many years: but, when the main stalk or root grows hard or woody, the younger shoots do not push so luxuriantly, and they are then obliged to plant anew; this however is easy, being done gradually, for the pieces are generally supplied as they clean them, by throwing up every stubbed or falling root they find, planting a few joints in the place.

50. The common millet was originally brought from the eastern countries, where it is still greatly cultivated, from whence we are furnished annually with this grain, which is by many persons greatly esteemed for puddings, &c. but is seldom cultivated in England in quantity, but by way of curiosity in small gardens, for feeding of poultry; but the seeds generally ripen very well. They must be sown the beginning of April, upon a warm dry soil, but not too thick, because these plants divide into several branches, and should have much room; and, when they come up, they should be cleared from weeds, after which they will, in a short time, get the better of them, and prevent their future growth. In August these seeds will ripen, when it must be cut down, and beaten out, as is practised for other grain; but when it begins to ripen, if it be not protected from birds, they will soon devour it.

57. Guinea-grass is increased in the same manner, but does not require near so much moisture, and is reckoned a more hearty fodder. It is not so much cultivated as it ought to be. The lands about the towns are too subject to drought to produce it in any perfection; and in the other parts of the country they are too indolent to be at the trouble of planting it; not considering how much time and labour is lost in seeking for other fodder, which is not so good, and cannot so easily be obtained; nor do they consider the losses they sustain in stock, for the want of abundance of good wholesome food. See *ANDROPOGON*, *ALOPECURUS*, *CYNOSURUS*, *HOLCUS*, and *PASPALUM*.

PANIEFOULE, a lake of Africa, in Hoval, which communicates with the Senegal in lat. 16. 40. N.

PANIGAROLA (Jerome), an Italian prelate, and one of the most celebrated preachers in the sixteenth century, was descended from a noble family, and born at Milan in 1548. He discovered early proofs of extraordinary genius and abilities; and, besides an uncommon facility

in acquiring knowledge, possessed surprising powers of memory, which enabled him to retain whatever he learned. Being soon sent to the university of Pavia, he distinguished himself by the rapidity of his progress in learning, while at the same time he rendered himself notorious for his irregularities and turbulent spirit. Never was there any disturbance in the university, but Panigarola would be found concerned in it; and scarcely a night passed, in which, at the head of the pupils from Milan, he was not engaged in quarrels and battles with the students from Placentia, Pavia, or some other place. At length his excesses proceeded to such a length, that the senate of Milan ordered his father to withdraw him from Pavia. He was now sent to Bologna, where for some time he rendered himself notorious for his amours and debaucheries; but suddenly and most unexpectedly an entire change took place in his disposition, and he expressed a strong inclination for embracing the monastic life; and, having overcome the repugnance of his father, who entertained other views for him, he took the habit of St. Francis at Florence, in 1567, when he was nineteen years of age. In this new career he became quite an altered man, and his whole delight consisted in the most regular and punctual observance of the duties of the cloister, and assiduous study. In the year 1570, the guardian of his convent, who was engaged to preach the lent-sermons at Sarzana, having fallen sick, directed Panigarola to become his substitute. Though then only twenty-two years of age, he displayed such powers of eloquence, that the knights of the military order of St. Stephen at Pisa would have him for their advent-preacher; and, in the following year, the grand-duke Cosmo appointed him to preach the lent-sermons in the cathedral at Florence. When he had finished this course of sermons, to the universal satisfaction of his crowded auditory, he went to Rome, where a chapter-general of his order was held, and where all ranks were charmed with his impressive preaching. Pope Pius V. heard him, and was astonished; but, well knowing that so young an orator stood in need of a more perfect acquaintance with divinity, the sacred scriptures, and the fathers, than it was possible for him to have already acquired, recommended it to him to devote some time to close study; and, as he was likely to be perpetually interrupted by solicitations to fill the pulpit in Italy, he advised him to go to France, and attend the professors at the university of Paris.

Panigarola followed the advice of his holiness, and studied with the utmost diligence during two years; after which he resumed his pulpit-labours, and preached at first to the Italians who were settled at Lyons, and afterwards to his numerous countrymen whom commercial pursuits had drawn to Antwerp. Upon his return to Italy, his celebrity became so great, that there was no church sufficiently large to accommodate the crowds who were attracted by his preaching; and, when he was upon a journey, he could scarcely pass through any city or town, without being compelled so far to satisfy the people as to give them at least one sermon. Being at Rome in the year 1586, he was consecrated titular bishop of Chrysopolis, and appointed coadjutor to the bishop of Ferrara, at the instance of the duke, who by that means hoped to fix his residence in that city. In less than three months, however, he received an order to quit Ferrara and the duchy; which disgrace he attributed to the intrigues of a minister, who, jealous of the great credit which he enjoyed at court, was so artful as to persuade the duke, that he betrayed the secrets of state to cardinal Ferdinand de Medici. He went immediately to Rome; and was received with great kindness by pope Sixtus V. who appointed him to preach at St. Peter's in the year 1587. In the same year Charles-Emmanuel, duke of Savoy, granted him a nomination to the bishopric of Asti in Piedmont, which Sixtus readily confirmed. In 1589, the same pontiff sent our prelate into France, to encourage the party of the League against Henry IV. He was present at the siege

siege of Paris, and employed all his eloquence in animating the Parisians to submit cheerfully to the privations and miseries which they suffered during the memorable blockade of their city. When Henry raised the siege, Panigarola returned to Asia, where, while he was occupied in correcting a number of abuses which had crept into his diocese, he died in 1594, when only forty-six years of age. It was the very general opinion, that he fell a sacrifice to poison administered by those who dreaded the reforms which he was intent on introducing. His most celebrated productions consist of several volumes of "Sermons," in Latin and Italian, which are entitled to be ranked with the best specimens of sacred eloquence among the orators of Italy in the sixteenth century. Notwithstanding the premature age at which he died, and his numerous engagements, he found time for the composition of various other theological pieces, as commentaries, theses, orations, and poems; also "Paraphrasi sopra Demetrio Falerio, &c." consisting of a learned commentary upon the treatise of Demetrius Phalereus on eloquence. *Morevi.*

PANIGENA, in ancient geography, a town on this side of the Ganges, between Paluga and Conagera. *Ptolemy.*

PANINI (Paolo), a painter of perspective and architecture. He was born at Placentia in 1691, with a most happy genius to painting, which he cultivated by studying at Rome, where he designed every vestige of ancient magnificence, the ruins of superb Roman edifices, cenotaphs, columns, baths, arches, and obelisks; as also some of the most entire buildings, the ornaments of modern Rome. His composition is rich; the truth of his perspective is critically exact; and his paintings are universally esteemed for the grandeur of the architecture, for the clearness of his colouring, for the beautiful figures which he generally introduced, and also for the elegant taste with which he disposed them. He always designed them correctly, and set them off with suitable attitudes and expression. At Rivoli, a pleasure-house belonging to the king of Sardinia, there are several of Panini's paintings, which are views of that fine retreat and its environs. They are beautifully coloured, well handled, and with a touch full of spirit; though in some parts the yellow seems a little too predominant, and the lights are not always distributed in such a manner as to produce the most striking effect.

PANIONIA, [Greek.] An ancient festival celebrated in honour of Neptune by a concourse of people from all the cities of Ionia. It is remarkable in this festival, that, if the bull offered in sacrifice happened to bellow, it was accounted an omen of divine favour, because that sound was thought to be acceptable to Neptune.

PANLOWCE, a fortress of Russian Poland, near Kamienec, in Podolia; which, in 1621, withstood the attack of the Turks.

PANIS, an island in the Atlantic, at the mouth of the river Bandi, near the coast of Africa. Lat. 5. N.

PANIS, a tribe of Indians, on a branch of the Missouri. 600 miles from the Mississippi.

PANISSIÈRE, a town of France, in the department of the Rhône and Loire: twenty-one miles west of Lyons, eighteen south-east of Roanne.

PANIUM, in ancient geography, a promontory of Europe, on the coast of the Thracian Bosphorus.

PANIUS. See PANEUS.

PANKE, *f.* [a name, as we presume, of American origin, published by Feuillée, and adopted by Molina, though the latter has transferred it from the original plant of Feuillée, which is a Gunnera, to a totally distinct genus, termed by that author Llaupanke. Willdenow has retained this barbarous name, and thus it has become established.] In botany, a genus of the class enneandria, order monogynia. Generic essential character—Calyx four-cleft; corolla bell-shaped, four-cleft; capsule of two valves, with one seed.

1. Panke tinctoria: leaves stalked, five-lobed. Native of moist situations on the mountains of Chili. Root perennial. Stem five feet high. Leaves serrated, five-ribbed, papillary, downy, pulpy, permanent. Footstalks round, prickly, half a foot long. Flowers very numerous, on partial stalks. *Willd. after Molina.*

2. Panke sonchifolia, (Llaupanke of Feuill. Peruv. ii. 742. t. 31.) leaves lyrate, clasping the stem: found by Feuillée on the mountains of Chili. Root perennial, tapering. Stem herbaceous, three feet high, simple, round, leafy. Leaves a foot long, obtuse, slightly wavy, and finely toothed or crenate; their lobes rounded, close, lying over each other, finely downy, reticulated with veins. Flowers crimson, the lowermost a little remote, and of six petals or rather segments, the rest of but four; each segment is oval, about half an inch long, with a violet spot in the middle. Stamens, according to Feuillée, only equal in number to the petals, or rather segments of the flower. There is a disagreement between his account and the class, as well as character, indicated by Molina. This species is used in dying black. It also serves to stop the bleeding of the piles, as well as to relieve the pain of that complaint; the qualities of the herb being, as it seems, astringent.

3. Panke anapodophylli folio, (Feuil. ii. 741. t. 30.) by later authors called Gunnera scabra: leaves lobed palmate, serrated, very harsh, taller than the fruit-bearing stalk. All the stalks prickly. Native of watery marshy places in Chili and Peru. Much larger than the preceding, and distinguished by its lobed leaves, which are extremely rough on the upper side, with minute callous points, as well as besprinkled on both sides with short hairs. The stalks, both of the leaves and flowers, are beset with scattered prominent prickles, and the latter are much the lowest. The bunch of flowers is a span long, very dense and thickly branched. Feuillée says this plant is of a cooling quality, and that a decoction of its leaves is taken for that purpose in hot weather, and the stalks of the leaves are peeled and eaten. He found their flavour sweetish and agreeable. The root is used for dying black, like the preceding, and for tanning, which proves its astringent quality.

PANKINA, a town of Russia, in the government of Kolivan: sixty-eight miles north-west of Biisk.

PANKIRA, a town of Hindoostan, in Baglana: twelve miles north of Saler Mouler.

PANKLIËR, a town of Curdistan, in the government of Van, on Lake Van: twenty-five miles east of Aklat.

PANKOVA, a town of Russia, in the government of Irkutsk, on the Ilim: fifty-six miles west of Orlenga.

PANLANG, a town of Birmah, on the Rangoon branch of the Irawaddy, formerly a place of great opulence and extent, and even now of some importance: sixteen miles north-west of Rangoon.

PANMA-KELEUGO-MARA'VA. See POLYPODIUM.

PANNA'DE, *f.* The curvet of a horse. *Ainworth.*

PANNAG, [Heb. balsam.] Whether this be the name of a place whence wheat was brought, as it was from Minnith, (see Ezek. xxvii. 17.) as seems most probable, or the name of a drug, according to its signification, is uncertain: Cruden supposes the latter. See Brown's Dict. of the Bible.

PANNAGE, *f.* [*panagium*, low Lat. *panage*, Fr.] Food that swine feed on in the woods, as mast of beech, acorns, &c. which some have called *panues*. It is also the money taken by the agitors for the food of hogs with the mast of the king's forest. *Cowel.*—Acorns, which are included in the name of mast, are the chief of those things which the ancient laws call *pannage*. *Gibson's Codex.*

PANNAH, a town of Hindoostan, in the country of Allahabad: thirty miles east-south-east of Chatterpour, ninety-five south-west of Allahabad. Lat. 24. 48. N. lon. 80. 28. E.

PANNA'RIA, one of the Lipari islands. (See LIPARI.) The ancients called it *Thermisia*, from the hot waters which

which they found in it. It may be about eight or nine miles in circumference. It bears wheat, and grapes from which the inhabitants make wine. Pannaria, like the other adjacent islands, appears to be a volcano; its original having been destroyed by continued eruptions. It is now no longer of a conical figure. It contains about 100 inhabitants, reckoning every soul, men, women, and children. It is, like Stromboli, governed by a curate, who depends on the priest of the parish of St. Joseph in Lipari; and, when any couple in the island determine to marry, they must cross the sea to Lipari to receive the nuptial benediction in the parish of St. Joseph, or pay a sum for a licence to empower the curate of Pannaria to perform the ceremony. All the other adjoining islands are subject to the same regulation.

The inhabitants of Pannaria live by fishing, and by taking small quantities of game on this and the little contiguous islands. They bring up and tame those birds known by the name of gulls, which are seen in tempestuous weather flying near the surface of the sea: they are here called *corraccio*; they have their nests on the steep inaccessible cliffs of the several islands. When the islanders bring these birds up tame, they feed them with fish, which, though of such size you would think it impossible for their stomachs to receive them, they eagerly stretch their necks and swallow rapaciously. These birds are thus brought up to be as tame as pullets or pigeons; and such an attachment do they often acquire to the places in which they are reared, that some of them have been known to return to these islands after being conveyed to Mellazzo and Messina. See the article *LARUS*.

On the summit of a hill in this island, which projects over the sea, the inhabitants pretend to show a castle and an inscription. But their castle is only an elevated peak of the rock, which nature seems to have prepared as a retreat for birds. It consists of puzzolana; and has been actually formed by the action of winds and rains, for a long course of time, into a fantastic figure, which may appear, when carelessly viewed from a distance by an undistinguishing eye, the remains of some ancient structure. The good people of the island, not being able to judge of it otherwise than from appearance, are persuaded, that it can be nothing but a castle, which must have been reared for the defence of the island against the Turks and the corsairs of Barbary. These they consider as the most dreadful scourge with which mankind can possibly be afflicted, and fear them much more than the eruptions of the volcano. When they feel their island shaken, they embark with all their wealth, which a single sloop easily contains; and on-board they are safe from both the shaking of the earth and the eruptions of the lava.

In this island there appear various remains of ancient buildings, but very ruinous and very scanty. In ploughing the fields, many remains of sepulchres, in different modes of construction, are found; some of rough stones, tiles, or bricks; others consisting each of a single stone. Vases of various sorts and sizes are also said to have been found in the same fields; utensils of different kinds, money, chains, and medals of lead. In places along the shore of the island, where the sea appears to have encroached, there are some hewn stones to be seen: they seem to be remains of walls, which must have been very strong and of elegant architecture. In other places farther distant from the shore, there likewise appear fragments of walls sunk in the ground, and apparently overwhelmed with mud, which the winds and rains have brought down from the mountain above. These remains show, that Pannaria, either under the Greeks, or in that period when all the elements were taxed for the gratification of Roman luxury, must have been adorned with superb buildings, as well as the adjacent islands of Lipari, Stromboli, and Basiluzzo.

PAN'NE, a river of America, which runs into the Wabash in lat. 40. 22. N. lon. 86. 36. W.

PAN'NEL, *f.* [*panneel*, Dutch; *paneau*, Fr.] A kind of rustic saddle:

A *pannel* and wanty, pack-saddle and ped,
With line to fetch litter, and halters for hed. *Tusser.*

His strutting ribs on both sides show'd,
Like furrows he himself had plow'd;
For underneath the skirt of *pannel*,

'Twixt every two there was a channel. *Hudibras.*

PANNEL, in falconry, the stomach of a hawk. *Ainsworth.*

PANNEL, in law. See *PANEL*.

PANNELS, in military affairs, are the carriages which carry mortars and their beds upon a march. *James's Milit. Dict.*

PAN'NELA, (Old,) a town of Hindoostan, in Visiapour: twelve miles east of Merritch.

PAN'NELA, (New,) a town of Hindoostan, in the country of Visiapour: twenty-two miles west of Merritch, twenty-nine south of Currer. Lat. 17. 3. N. lon. 74. 58. E.

PANNELLATION, *f.* [from *panel*.] Act of empannelling a jury.—They in the said *pannellation* did put Rich. Wotton, and other privileged persons, which were not wont anciently to be impannelled. *A. Wood's Ann. Univ. Ox.*

PANNERBARY, a town of Bengal: eight miles north-east of Goragot.

PAN'NI, a town of Naples, in Capitanata: nine miles south of Troja.

PAN'NIC, or PAN'NICLE, *f.* A plant. See *PANICUM*.—The *pannicie* is a plant of the millet kind, differing from that by the disposition of the flowers and seeds, which, of this, grow in a close thick spike: it is sowed in several parts of Europe, in the fields, as corn for the sustenance of the inhabitants; it is frequently used in particular places of Germany to make bread. *Miller*.—September is drawn with a cheerful countenance; in his left hand a handful of millets, oats, and *pannicie*. *Peacham*.—*Pannick* affords a soft demulcent nourishment. *Arbutnot.*

PAN'NIER, *f.* [*panier*, Fr. probably from *pain*, bread, as having been originally used to carry bread and other provisions.] A basket: a wicker vessel, in which fruit, or other things, are carried on a horse.—We have resolved to take away their whole club in a pair of *panniers*, and imprison them in a cupboard. *Addison*.

The worthless brute
Now turns a mill, or drags a loaded life
Beneath two *panniers* and a baker's wife. *Dryden.*

PAN'NIER-MAN, *f.* [in the inns of court.] One who calls the gentlemen to dinner and supper; and provides mustard, pepper, and vinegar, for the hall.

PAN'NIKEL, *f.* [*pannicula*, Ital. *pannicle*, Fr.] The brain-pan; the skull. *Obsolete*.

To him he turned, and with rigour fell
Smote him so rudely on the *pannikell*,
That to the chin he cleft his head in twaine. *Spenser.*

PAN'NIPUT, a town of Hindoostan, in the country of Delhi. In a plain near this town a battle was fought, between Abdallah king of Candahar and the Mahrattas, in the year 1761. It was one of the most bloody battles ever fought in Hindoostan; the army of Abdallah amounted to 150,000, that of the Mahrattas was not less than 200,000; the carnage was dreadful, and the number of Mahratta prisoners almost incredible. They lost the flower of their army, and their power from that period declined: fifty miles north-west of Delhi. Lat. 29. 25. N. lon. 77. 10. E.

PAN'NONA, in ancient geography, a town situated in the interior of the isle of Crete, between Gortyna and Gnosus. *Ptolemy*.

PANNO'NIA, a large province of Europe, which was known

known to the Romans in the time of Augustus. See the article GEOGRAPHY, vol. viii. p. 375. It was during the war of Augustus with the Japydes and the Dalmatians that the Roman arms penetrated into the country of the Pannonians: and it became a Roman province under Tiberius. In the time of Antonine, Pannonia was divided into Superior and Inferior, the separation being made by the river Arrabo (Raab): one of these divisions was called Pannonia Prima, and the other Pannonia Secunda.

The more ancient inhabitants of Pannonia were the Scordisci and Taurisci, who were in their origin Gauls. Ptolemy assigns to this country a great number of places; but none of them appear to be very considerable. This country was occupied by a semi-barbarous people, when Philip, king of Macedon, conquered it: but they soon afterwards revolted, and Alexander re-conquered them. The Gauls, under the conduct of Brennus and Belgius, forcibly transferred it to Ptolemy, brother of the king of Macedon. Cæsar gained a settlement in part of it, and passed to it across the mountain, hence called Alpes Juliæ. Tiberius, as we have said, added Pannonia to the Roman empire, and it continued tributary to the Romans till the fall of their empire. It afterwards became subject to the Goths, and then to the Huns, from whom Hungary is said to have derived its name.

PANNO'NIUS (Janus), a modern Latin poet, born in 1434, was a native of Hungary. He travelled into Italy for instruction in polite literature; and upon his return, used his endeavours to promote the study of it in his own country. He was raised to the see of Funfkirchen (five-churches) in Lower Hungary, where he died in 1472. This prelate is said to have been remarkably distinguished for his proficiency in the Greek and Latin languages, in the latter of which he composed a variety of poems, which were printed both separately and in the *Deliciæ Poetarum Hungarorum*. An edition of them from a manuscript in the imperial library, was given at Utrecht so lately as 1784, in two volumes octavo. *Gen. Biog.*

PANNU'NAH, a town of Hindoostan, in the circar of Kerleh: twenty miles south-east of Maltoy.

PAN'NUS, *f.* A disease of the eye; a kind of fleshy web occasioned by an inflammation.

PANNY'A, a town of Bengal, forty-five miles west of Nagore.

PANNYAL'LUM-CRUT'CH, a town of Hindoostan, in Tinevelly: fifteen miles south-east of Coilpetta.

PAN'NYLE, a town of Bengal: eighteen miles north-west of Sishet.

PANO'MI, a town of European Turkey, in Macedonia: sixteen miles south of Saloniki.

PANOMPHÆ'US, in mythology, a designation given to Jupiter, because he was looked upon as the author of "all sorts of divination," having the books of fate, and out of them revealing either more or less, as he pleased, to inferior demons.

PAN'OPLY, *f.* [Gr. from παν, all, and οπλα, armour.] Complete armour.—We had need to take the Christian *panoply*, to put on the whole armour of God. *Ray on the Creation.*

In perfect silver glistening *panoply*
They ride, the army of the Highest God!

More.

In arms they stood
Of golden *panoply*, refulgent host!

Milton's P. L.

PANOP'OLIS. See ACHMIN, vol. i.

PANORA'MA, *f.* [*panorame*, Fr. from the Gr. παν, all, the whole, and οραμα, a view.] A large circular painting, having no apparent beginning or end, from the centre of which the beholder views distinctly the several objects of the representation.

PANOR'MA, a harbour on the north coast of the island of Myconi. Lat. 37. 29. N. lon. 25. 23. E.

PANORMITA'NO (Antonio), or ANTHONY of PALERMO, whose proper name was *Beccadelli*, a writer
VOL. XVIII. No. 1247.

of some distinction both in prose and verse, was born in 1374, of a respectable family, originally from Bologna. He was sent on a public allowance to study the law at Bologna; and afterwards entered into the service of Philip Maria Visconti, duke of Milan, who kept him at his court with an honourable pension. He was also made professor of belles-lettres and of rhetoric in the university of Pavia; and there, probably in 1432, received the honour of the poetic laurel from the emperor Sigismund. Alphonso king of Naples, probably on leaving Milan in 1435, carried Antonio with him to his court; and he was thenceforth the inseparable companion, both in peace and war, of this prince, who heaped on him all kinds of favours. He was aggregated to the body of Neapolitan nobility; enriched with many donations; among the rest that of a delightful villa called Sisia; and employed in various honourable commissions. One of these, in 1451, was a deputation to Venice, in order to request from that state the supposed arm-bones of the historian Livy, which he obtained. So great was the veneration of Antonio for this famous writer, and his love for literature, that he sold a farm in order to purchase a copy of Livy written by the hand of Poggio the Florentine. After the death of Alphonso, Beccadelli was equally favoured by his son and successor Ferdinand, who made him his secretary and counsellor. This learned man died at Naples in 1471.

Antony of Palermo was a distinguished Latin writer, both in prose and verse. 1. As an historian, he was known by his work *De Diâis et Factis Alfonso regis Arragonum*. On the Sayings and Actions of Alphonso king of Arragon; for which he was rewarded by that monarch with a thousand gold crowns: no proof of its impartiality. It has frequently been reprinted, with additions. He also undertook to write the life of the succeeding king, Ferdinand; but no part of this work ever appeared. 2. A collection of five books of his Epistles, Two Harangues, and some Verses, was printed at Venice in 1453. 3. But the most noted of his productions, and unfortunately one of the latest, was the collection of short poems in two books, entitled *Hermaphroditus*, of which the greater number were so grossly obscene, that they excited, even in that licentious age, the loudest clamours against the author. They were attacked both in writing and from the pulpit; they were publicly burned in several cities of Italy, and the writer's effigy in some places accompanied them to the flames. It does not appear that the worst of these pieces were ever printed; but a few copies of the whole are still preserved in some of the libraries of Italy. *Gen. Biog.*

PANOR'MO, a town of Asiatic Turkey, in Natolia, on the south coast of the sea of Marmora: sixteen miles south-east of Artaki.

PANOR'MO, a town of European Turkey, in Albania, situated on a gulf of the Adriatic, opposite the island of Corfu: forty-five miles south-south-east of Valona. Lat. 40. N. lon. 20. 1. E.

PANOR'MUS, in ancient geography, (Palermo,) a town of Sicily, situated towards the north-west, founded, as it has been said, by the Phœnicians. It held a distinguished rank among the towns of Sicily. In the year of Rome 499 it was taken by the Romans, and in 503 they gained a battle there under the orders of the proconsul Metellus. It afterwards became a Roman colony. Now PALERMO.—A town on the north coast of the isle of Crete, between Citæum and Heraclæum.—A town of Achaia, in Peloponnesus, near the promontory Rhium.—A town of Samos.—A town of the Thracian Chersonesus, placed by Pliny on the west side of the peninsula, and mentioned by no other writer.

PANORMUS, a port of Attica; its name denoting it to be capacious.—Another, of Epirus; a large harbour in the heart of the Montes Cerauni, below the citadel Chimæra.—A third, of Ionia, near Ephesus, with the temple of the Ephesian Diana.—A fourth, in Ionia, north-east of the promontory of Posidium, south-east of the pro-
4 S montory

montory of Trogilium, and south of Miletus. South of this port was the famous temple of Apollo Branchidæ; and to this place strangers repaired to consult the oracle. The ancients pretended that the stream, which discharged itself into the sea at this port, sprang from mount Mycale, and passed under the sea till it re-appeared in the vicinity of this temple.

PANOR'PA, *f.* The SCORPION-FLY; in entomology, a genus of insects of the order neuroptera. Generic characters—Mouth lengthened into a cylindrical horny proboscis; feelers four, nearly equal; stemmata three; antennæ longer than thorax; tail of the male only chelated or clawed, resembling the dart of a scorpion; a circumstance from which almost all naturalists have given it that name; but this formidable instrument is not formed for any hostile purpose; it is used by him in laying hold of his female during their amorous embraces. There are nine species.

1. *Panorpa communis*, the common scorpion-fly: wings of equal length, spotted with black. This, as its name imports, is the most familiar of all the species, being very frequently seen in our meadows during the early part of summer. It is a longish-bodied fly, of moderate size, the body yellow and black, with four transparent wings elegantly variegated with deep brown or black spots: the tail of the male insect, which is generally carried in an upright position, is formed by the three last segments of the abdomen, and is of a reddish colour; head the same. The wings are as long as the body. Inhabits Europe. This species is represented on the preceding engraving: fig. 2. the male; 3. the female; 4. the head magnified, to show the singular proboscis, or snout.

2. *Panorpa Germanica*: wings equal, hyaline, tipped with brown. It inhabits Germany, and resembles the common.

3. *Panorpa scorio*: wings equal, black spotted with white; body dusky. It is found in different parts of North America.

4. *Panorpa fasciata*: wings equal, yellowish with black dots and bands. It is found in North America.

5. *Panorpa hyemalis*: wings subulate, slightly incurved, ciliate: the female is apterous. It is a small insect, and is found in Saxony.

6. *Panorpa tipularia*: wings equal, immaculate; abdomen falcate; body yellow, legs very long. It inhabits Italy.

7. *Panorpa Capensis*: wings equal, and immaculate; body ferruginous. It inhabits the Cape.

8. *Panorpa Japonica*: wings equal, hyaline, with two black bands; body black. It is found in Japan.

9. *Panorpa Cos*, the Greek scorpion-fly: wings erect, lower ones nearly linear, and very long. This is a native of Greece and the islands of the Archipelago, and is an insect of a very peculiar appearance. It is distinguished by having the lower wings so extremely narrow or slender as to resemble a pair of linear processes with an oval dilatation at the tip, while the upper wings are very broad, oval, transparent, and beautifully variegated with yellowish-brown bars and spots. See fig. 5.

PANO'V, a river of Russia, which runs into the Niznei Tunguska. Lat. 64. 40. N. lon. 102. 54. E.

PANO'VA-TSJERA'VA. See TROPA.

PANREE'DY, a town of Bengal: thirty miles south-east of Curruckdeah.

PAN'SA, (C. Vibius), a Roman consul, who, with A. Hirtius, pursued the murderers of Julius Cæsar, and was killed in a battle near Mutina. On his death-bed he advised Octavius to unite his interest with that of Antony, if he wished to revenge the death of Julius Cæsar; and from his advice soon after rose the celebrated second triumvirate. Some suppose that Panfa was put to death by Octavius himself, or, through him, by the physician Glicon, who poured poison into the wounds of his patient. Panfa and Hirtius were the two last consuls who enjoyed the dignity of chief magistrates of Rome, with full power.

The authority of the consuls afterwards dwindled into a shadow. *Patere*. ii. 6. *Dio*. 46.

PANSAGUT'CHY, a town of Bengal: eight miles north of Rajemal.

PANSANG', or PU'LO PANSANG, a small island in the gulf of Siam. Lat. 9. 15. N. lon. 103. 30. E.

PANSAR', a town of Hindoostan, in Guzerat: sixteen miles north of Amedabad.

PANSE', a branch of the river Wabash, in the Indiana territory.

PAN'SHAH, a town of Meckley: fifty-five miles south-south-east of Munnypour.

PAN'SHALA, a town of Guriel: thirty miles east of Pati.

PANSOPHICAL, *adj.* [from *pan sophy*.] Aiming or pretending to know every thing.—It were to be wished indeed, that it were done into Latin, for the humbling of many conceited enthusiasts and *panosophical* pretenders. *Worthington's Lett. to Hartlib*, 1660.

PAN'SOPHY, *f.* [from *παν* and *σοφία*, Gr.] Universal wisdom. This old word has lately been revived.—The precepts of *panosophy* ought to contain nothing in them, but what is worth our serious knowledge. *Hartlib's Reform. of Schools*, 1642.—The French philosophers affect a dogmatical manner, the reverse of true philosophy; a sort of *panosophy*, or universality of command over the opinions of men, which can only be supported by the arts of deception. *Boothby on Burke*.

PANS'RUCKY, a town of Hindoostan, in Bahar: twenty-seven miles south of Bahar. Lat. 24. 46. N. lon. 85. 44. E.

PAN'SY, *f.* A flower. See PANCY.

PANT, a river of England, in the county of Essex, which rises about three miles south-east from Malden, passes by Bocking, &c. and about three miles east of Braintree runs into the Blackwater, if it be not the same river.

To PANT, *v. n.* [*panteler*, old Fr.] To palpitate; to beat as the heart in sudden terror, or after hard labour.—Yet might her piteous heart be seen to *pant* and quake. *Spenser*.

Below the bottom of the great abyss,
There, where one centre reconciles all things,
The world's profound heart *pants*. *Cresshaw*.

To have the breast heaving, as for want of breath.—Miranda will never have her eyes swell with fatness, or *pant* under a heavy load of flesh, till she has changed her religion. *Law*.

Pluto *pants* for breath from out his cell,
And opens wide the grinning jaws of hell. *Dryden*.

To play with intermission:

The whispering breeze
Pants on the leaves, and dies upon the trees. *Pope*.

To long; to wish earnestly: with *after* or *for*.—They *pant after* the dust of the earth, on the head of the poor. *Amos* ii. 7.

Who *pants* for glory, finds but short repose;
A breath revives him, and a breath o'erthrows. *Pope*.

PANT, *f.* Palpitation; motion of the heart:

Leap thou, attire and all,
Through proof of harness, to my heart, and there
Ride on the *pants* triumphing. *Shakespeare*.

PAN'TABLE, *f.* A corruption of *pantofle*; a shoe; a slipper.—What pride equal to his [the pope's] making kings kiss his *pantables*! *Sir E. Sandy's State of Relig.* 1605.

Rich *pantables* in ostentation shewn,
And roses worth a family. *Massinger's City Madam*.

PANTÆ'NUS, a learned Christian philosopher of the Stoic sect in the second century, and the first president of the

the catechetical school of Alexandria of whom there is any mention made in antiquity by writers of undoubted credit. His descent, and the country of his birth, are both uncertain; some authors stating him to have been of Jewish extraction, others a native of Sicily, and others the descendant of Sicilian parents, but born at Alexandria. According to Cave, he flourished about the year 182. He is generally thought to have been one of the masters of Clement of Alexandria, who speaks of him with great respect. He is also mentioned very respectfully by Alexander, bishop of Jerusalem, in a fragment of a letter to Origen, preserved by Eusebius; in which he particularly says, that Pantænus was the person who introduced him to the acquaintance of that father. Of the high estimation in which he was generally held we may form some idea from the consideration, that Origen justifies himself in the study of heathen learning by the example of Pantænus, whom he calls a very useful person, and well furnished with that part of knowledge. Photius speaks of him as a hearer of some of those who had seen the apostles, and even of some of the apostles themselves; but the latter statement he does not positively assert, and there are few moderns who will admit its probability. Upon the whole, Pantænus was eminent for his learning, prudence, and piety; and presided over the catechetical school at Alexandria with great reputation and success. So great, likewise, was his zeal for the success of the Christian cause, that, when the Ethiopians applied to Demetrius, bishop of Alexandria, to send them some person who should instruct them in the principles of Christianity, he readily undertook that mission, and is said to have acquitted himself in it with great ability. After his return to Alexandria Pantænus resumed the precedence of the catechetical school, in which he continued to explain the Scriptures publicly under the reigns of the emperors Severus and Caracalla, rendering greater service to the church, says St. Jerome, by his discourses than by his writings. The same father informs us, that there were extant Commentaries of his upon the Scriptures; but there is now nothing remaining of his writings, excepting a short passage in the Eclogæ, ascribed to Clement of Alexandria, containing the following rule for the better understanding of the prophetic language, which has been since adopted by all the interpreters of the prophecies: "That the prophets often express themselves in indefinite terms, and that the present tense is frequently used by them for both the preterite and future tenses." Cave places the death of Pantænus about the year 213. *Cave's Hist. Lit.* vol. i.

PANTA'IA. See PANDAIA.

PANTAGRUEL, the feigned name of a giant in Rabelais.

PANTAGRUELIST, *f.* A good companion, imitating Pantagruel. *Bailey.*

PANTAGY'AS, in ancient geography, a small river on the eastern coast of Sicily, which falls into the sea, after running a short space in rough cascades over rugged stones and precipices.

PANTALARIA, a small island in the Mediterranean, situated between the island of Sicily and Cape Bon, on the coast of Tunis; about twenty-five miles in circumference, and containing about 4000 inhabitants. The principal productions are olives, figs, raisins, capers, and cotton; the cattle are numerous, but bread-corn is imported from Sicily. The language is a mixture of African and Italian. Lat. 36. 55. N. lon. 12. 15. E.

PANTALE'O, (St.) a town of the island of Sardinia, the site of which was anciently that of the episcopal city of Dolio: sixteen miles north of Cagliari.

PANTALE'ON, a king of Pisa, who presided at the Olympic games, B. C. 664, after excluding the Eleans, who on that account expunged the Olympiad from the Fasti, and called it the second Anolympiad. They had called for the same reason the eighth the first Anolympiad, because the Pisæans presided.

PANTALEONE, a small low island in the Mediterra-

nean, near the west coast of Sicily; formerly united to the continent by a neck of land, which was destroyed by the inhabitants to keep off the enemy. In this peninsula stood the ancient Motya. Lat. 37. 56. N. lon. 12. 28. E.

PANTALEONE, a stringed instrument in Germany at the latter end of the seventeenth century. The inventor's name was Hebenstrick; but, from the success of his instrument, he assumed that of Pantaleone. It was more than nine feet long, and had, when in order, 186 strings. The tone was produced by two sticks, like the dulcimer; it must have been extremely difficult to the performer, but seems to have been capable of great effect. Mr. Binder, organist of the Duom Kirk, at Dresden, was the last person who played upon it. It was this instrument, and the performance upon it at Paris in 1705, which gave birth to a very ingenious little work, under the title of "Dialogue sur la Musique des Anciens," by the abbé Chateauneuf. When we saw the ruins of this instrument at Dresden, soon after the seven years' war, the strings were almost all broken, and the court was so impoverished as not to like to be at the charge of new mounting it. It used to be one of the musical curiosities of that city, during the time that the elector of Saxony was king of Poland. *Burney.*

PANTALOO'N, *f.* [*pantaloon*, Fr.] The name of an ancient garment frequent among our forefathers, consisting of breeches and stockings all of a piece. A dress somewhat similar has been lately revived. The denomination comes from the Venetians, who first introduced this habit, and who are called *Pantalonis*, from St. Pantaleon, who was formerly their patron.—Whether the trunk-hose fancy of queen Elizabeth's days, or the *pantaloon* genius of our's be best. *Phillips's Theat. Poet.* 1675.

The French, we conquer'd once,
Now give us laws for *pantaloons*,
The length of breeches and the gathers. *Hudibras.*

A character in the Italian comedy; a buffoon in the pantomimes of modern times: so called from the close dress which he usually wears.—There are four standing characters, which enter into every piece that comes on the stage; the Doctor, Harlequin, *Pantalone*, and Coviello. *Pantalone* is generally an old cully, and Coviello a sharper. *Addison's Remarks on Italy.*

The sixth age shifts
Into the lean and slipper'd *pantaloon*,
With spectacles on nose, and pouch on side. *Shakespeare.*

PANTA'NO, a town of Sicily, in the valley of Noto: ten miles south of Modica.

PANTA'NO, a town of Italy, fifteen miles south-west of Modena.

PANTA'NO, a town of Naples, in Calabria Ultra: nine miles east of Bova.

PANTA'NO, a river of Naples, which runs into the sea ten miles east of Bova.

PANTAR, an island in the Eastern Indian Sea, of a square form, about forty-eight miles in circumference, separated from the east coast of the island of Lomablen by the strait of Alvo, and from the west coast of Ombay by a narrow channel, called the Strait of Pantar. Lat. 8. 10. S. lon. 124. 30. E.

PANTER, *f.* One who pants:
Swiftly the gentle charmer flies,
And to the tender grief soft air applies,
Which, warbling mystic sounds,
Cements the bleeding *panter's* wounds. *Congreve.*

PANTER, *f.* [from *painter*, Irish, a net; *paintealim*, to ensnare. *Lye.*] A kind of net; a pitfall. *Obsolete.*

To catch in his *panters*
Thesedamofels and brchilers,
Love will none othir birdis catche. *Chaucer.*

PAN'TESS, *f.* The difficulty of breathing in a hawk. *Ainsworth.*

PANTHE'A,

PANTHEA, *f.* [Greek.] Among the ancients, were single statues, composed of the figures, or symbols, of several different divinities combined.

Father Joubert, who has observed them on several medals, says their heads are most commonly adorned with the symbols or attributes belonging to several gods. An instance of this kind we have in a medal of Antoninus Pius; which at the same time represents Serapis, by the bushel it bears; the Sun, by the crown of rays; Jupiter Ammon, by the ram's horns; Pluto by the large beard; and Æsculapius, by the serpent twisted in his hand.

M. Baudelot, in a dissertation on the Lares, will have the Panthea to have had their rise from the superstition of those, who, taking several gods for the protectors of their houses, united them all in the same statue, by adorning it with the several symbols proper to each of these deities.

PANTHEISM, [from the Gr. *παν*, all, and *Θεος*, God.] A philosophical species of idolatry, in which the Universe was considered as the Supreme God. Who was the inventor of this system is, perhaps, not known; but it was of early origin, and differently modified by different philosophers. Some held the universe to be one immense animal, of which the incorporeal soul was properly the God, and the heavens and earth the body of that God; whilst others held but one substance, partly active and partly passive; and therefore looked upon the visible universe as the only *Númen*.

The earliest Grecian pantheist of whom we read was Orpheus, who called the world *the body of God*, and its several parts *his members*, making the whole universe one *divine animal*. In the ancient Orphic theology we are taught, that this universe, and all things belonging to it, were made *within* God; that all things are contained together in the womb of God; that God is the *head* and *middle* of all things; that he is the basis of the earth and heaven; that he is the depth of the sea, the air we breathe, the force of the untameable fire; that he is the sun, moon, and stars; that there is one divine body; for, *Πάντα γὰρ ἐν μεγάλῳ ταυ δε σωματι κείται*, "All these things lie in the great body of God."

But, further to prove that the most ancient Greek philosophers resolved all things into God, and made *God all*, we shall cite a most remarkable passage from Plutarch's *Defect of Oracles*: "Whereas there are two causes of all generations, the divine and the human, the most ancient theologers and poets attended only to the more excellent of these two; resolving all things into God, and pronouncing this of them universally; *Ζεὺς ἀρχή, Ζεὺς μέσσα, Διὸς δ' ἐκ πάντων πελονται*; 'That God is both the beginning and middle, and that all things are out of God;' inasmuch, that they had no regard at all to the other natural and necessary causes of things. But on the contrary, their juniors, who were called *naturalists*, deviating from this most excellent and divine principles, placed all in *bodies*, their passions, collisions, mutations, and commixtures."

That by "the most ancient theologers" here mentioned, Plutarch meant Orpheus and his immediate followers, is plain from the Orphic verse by which he proves their antiquity. By their "juniors," whom he calls *naturalists*, he could mean no other than the first Grecian philosophers, Anaximander, Anaximenes, and Hippo, who were followed by the atomists, Leucippus, Democritus, Protagoras, and Epicurus. But, with respect to the Universe being God, and all things divine and human being modifications of mere matter, the Stoics undoubtedly agreed with Anaximander and his followers; for the school of Zeno held but one substance. This doctrine, that all things are God, and that there is but one substance, was revived in modern times by Spinoza, an apostate Jew. As we shall give a life of him and a view of his principles, we must refer the reader for a fuller account to the article **SPINOZA**.

PANTHEIST, *f.* One who confounds God with the universe; a name given to the followers of Spinoza. See **PANTHEISM**.

PANTHEIS'TIC, *adj.* Confounding God with the universe.—Let any one but seriously consider the *pantheistic* system, whether it be not as wild enthusiasm as ever was invented and published to the world. It supposes God and Nature, or God and the whole universe, to be one and the same substance, one universal being; inasmuch that men's souls are only modifications of the divine substance: from whence it follows, that what men will, God wills also, and what they say, God says; and what they do, God does. Was there ever any raving enthusiast that discovered greater extravagance? This doctrine first owed its birth to Pagan darkness, and revived afterwards among the Jewish cabbalists: from thence it was handed down to Spinoza, who was originally a Jew; and from him it descended to the author or authors of the Pantheisticon; who, while they are themselves the greatest visionaries in nature, yet scruple not to charge the Christian world with enthusiasm. *Waterland's Christianity Vind.*

PANTHEOLOGIA, or **PANTHEOLOGY**, *f.* [from the Greek *παν*, all, *Θεος*, God, and *λογία*, a word.] An entire system or body of divinity.

PANTHEOLOGIST, *f.* A student in divinity, one who writes a system or body of divinity.

PANTHEON, *f.* [Greek; from *παν*, all, and *θεος*, god.] A temple, or church, of a circular form; dedicated to all the gods, or to all the saints. We shall mention a few of the most remarkable edifices of this kind.

1. The Pantheon of ancient Rome is of all these edifices the most celebrated, and that from which all the rest take their names. It was built by Agrippa, son-in-law of Augustus, in his third consulate, twenty-five years before Christ; though several antiquarians and artists have supposed that the Pantheon existed as long ago as the commonwealth, and that Agrippa only embellished it and added the portico. To this purpose they allege the authority of Dion Cassius, who, speaking of Agrippa, says, he also finished or perfected the Pantheon. It was dedicated by him to Jupiter Ultor, Jupiter the Avenger, according to Pliny's account; according to Dion Cassius, to Mars, Venus, and Julius Cæsar; but, according to the most probable opinion, to all the gods; and had the name *Pantheon*, on account of the great number of statues of the gods ranged in seven niches all round it; and because it was built of a circular form, to represent heaven, the residence of the gods; or because it was dedicated to "all the gods." It had but one door. It was 144, or, as Fabricius says, 140, feet diameter within, and just as much in height, of the Corinthian order. The roof was curiously vaulted, void spaces being left here and there for greater strength. The rafters, forty feet long, were plated with brass. There were no windows in the whole edifice; but sufficient light was let in through a round hole in the top of the roof. Before each niche were two columns of antique yellow marble fluted, and of one entire block. The whole wall of the temple, as high as the grand cornice inclusive, was cased with divers sorts of precious marble in compartments; and the frieze was entirely of porphyry. The outside of the front was anciently covered with plates of brass gilt, and the top with plates of silver, in lieu of which lead was afterwards substituted. The gates were of brass, and of extraordinary size and workmanship.

The eruption of Vesuvius, in the reign of Tiberius, and a great fire in the reign of Titus, damaged the Pantheon very considerably: but it was successively repaired by Domitian, Adrian, and Septimius Severus; and it subsisted in all its grandeur till the incursion of Alaric, in the time of Honorius: on this occasion it was stripped of several of its statues and ornaments of gold and silver. About thirty-nine years after this, Genseric, king of the Vandals, took away part of its marbles and statues: at length pope Boniface IV. obtaining this Pantheon of the emperor Phocas, converted it into a church, without any alteration in the building; and dedicated it to the Virgin, and all the martyrs. And it still subsists at Rome under the title of *Notre Dame de la Rotonda*.

The "Piazza della Rotonda," or Square of the Pantheon, is adorned with a fountain and an obelisk, and terminated by the portico of Agrippa. This noble colonnade consists of a double range of Corinthian pillars of red granite. Between the middle columns, a passage opens to the brazen portals, which, as they unfold, expose to view a circular hall of immense extent, crowned with a lofty dome, and lighted solely from above. It is paved and lined with marble. Its cornice of white marble is supported by sixteen columns, and as many pilasters of giotto antico: in the circumference there are eight niches, and between these niches are eight altars, adorned each with two pillars of less size, but the same materials. The niches were anciently occupied by statues of the great deities; the intermediate altars served as pedestals for the inferior powers. The proportions of this temple are admirable for the effect intended to be produced, its height being equal to its diameter; and its dome not an oval, but an exact hemisphere. The Pantheon is the most noble and perfect specimen of Roman art and magnificence which time has spared, or the ancients could have wished to transmit to posterity. It has served in fact as a lesson and a model to succeeding generations; and to it Constantinople is indebted for Santa Sophia, and to it Rome, or rather the universe, owes the unrivalled dome of the Vatican. Upon the whole, this is the most ancient edifice that now remains in a state of full and almost perfect preservation. It was converted into a church by pope Boniface IV. about the year 609; and since that period has attracted the attention and enjoyed the patronage of various pontiffs. Although the Pantheon probably owes its preservation to its having been converted into a church; yet, leaving to it its principal character as a temple, it seems better adapted to the purposes of a mausoleum; and it has actually been in some degree appropriated to this use; for it contains at present the tombs, or rather the busts, of several distinguished characters; among which are the celebrated antiquary Winckelman, Metastasio, Mengs, Poussin, Hannibal Caracci, and Raffaello himself. Two musicians also, Corelli and Sacchini, have been admitted to the honours of the Pantheon. The dedication of this church on the 1st of November, in the year 830, gave occasion to the institution of the festival of All Saints.

2. There was also at Rome another Pantheon, dedicated to Minerva, as the goddess of medicine. It was in the form of a decagon, and the distance from one angle to another measured 22½. Between the angles there were nine chapels of a round figure, designed for so many deities: and over the gate there was a statue of Minerva.

3. The Pantheon of Athens was in many respects little inferior to that of Rome, built by Agrippa. The Greek Christians converted it into a church, dedicated to the Virgin, under the name of Panagia. The Turks changed it into a mosque.

4. The Pantheon of Nîmes, in France, was a temple in that city, in which were twelve niches, for statues, supposed to have been destined for the twelve great gods.

5. In the Escorial (Spain) is a magnificent chapel, called Pantheon, thirty-five feet in diameter, and thirty-eight high from the pavement, which is of marble and jasper inlaid. The whole inside of the chapel is of black marble, except the luthern, and some ornaments of jasper and red marble. In this chapel are deposited the bodies of the kings and queens: there are only places made for twenty-six, eight of which are already filled.

6. As for the Pantheon built in Oxford-street, London, about fifty years ago, see the article LONDON, vol. xiii. p. 575.

PANTHER, *f.* [from the Greek παν, all, and θηρ, a wild beast.] The pard, so called because it was supposed to possess the ferocity of all beasts. See FELIS pardus.—Pan, or the universal, is painted with a goat's face, about his shoulders a panther's skin. *Peucham.*

VOL. XVIII. No. 1247.

An it please your majesty,
To hunt the panther and the hart with me,
With horn and hound. *Shakespeare.*

The panther's speckled hide
Flow'd o'er his armour with an easy pride. *Pope.*

PANTHER CREEK, a river of Kentucky, which runs into the Green River in lat. 37. 29. N. lon. 84. 45. W.

PANTHERINE TABLES, among the Romans, tables made of citron-wood, which were held in such high esteem, as to equal the value not only of silver and gold, but likewise of pearls. They had this name from their being spotted after the manner of panthers.

PANTICAPÆUM, in ancient geography, now *Kerche*, a town of Taurica Chersonesus, built by the Milesians, and governed some time by its own laws, and afterwards subdued by the kings of Bosphorus. It was, according to Strabo, the capital of the European Bosphorus. Mithridates the Great died there.

PANTICAPES, a river of European Scythia, which falls into the Borysthenes; supposed to be the *Samara* of the moderns.

PANTICO'SA, a town of Spain, in Arragon: thirteen miles north-north-east of Jaca.

PANTICUM, or PANTICHUM, in ancient geography, a town of Asia, in Bithynia, between Chalcedon and Libyssa, according to the Itinerary of Antonine.

PANTIKA, a town of Asiatic Turkey, in Natolia, on the north-east coast of the sea of Marmora: twelve miles south-east of Constantinople.

PANTILE, *f.* A gutter-tile. See PENTILE.—It is impossible for people to receive any great benefit from letters, where they are obliged to go to a shard, or an oyster-shell, for information; and where knowledge is confined to a pantile. *Bryant's Anal. Anc. Myth.*

PANTIN, a town of France, in the department of Paris: three miles east-north-east of Paris.

PANTING, *f.* Palpitation.—If I am to lose by fight the soft pantings which I have always felt when I heard your voice; pull out these eyes, before they lead me to be ungrateful. *Tatler.*

PANTINGLY, *adv.* With palpitation:
She heav'd the name of father.
Pantingly forth, as if it press'd her heart. *Shakespeare.*

PANTIPIO'LIS, a town of India, on this side the Ganges, between Berderis and Adirama.

PANTTLER, *f.* [*panetier*, Fr.] The officer in a great family, who keeps the bread. *Hemmer.*—He would have made a good *panbler*, he would have chipped bread well. *Shakespeare.*

When my old wife liv'd,
She was both *panbler*, butler, cook. *Shakespeare.*

PANTO'FLE, *f.* [*pantofle*, Fr. *pantofula*, Ital.] A slipper.—What pains doth that good holy father take, to lift up his foot so oft to have his *pantofle* kissed! *Harmar's Tr. of Beza's Serm.*—Melpomene has on her feet, her high cothurn or tragic *pantofles* of red velvet and gold, beset with pearls. *Peacham.*

PANTOGRAPH, *f.* [from the Gr. παν and γραφω.] A mathematical instrument, contrived to copy all sorts of drawings and designs.

PANTOMETER, *f.* [παν and μετρον, Gr.] An instrument for measuring all sorts of angles, elevations, and distances.

PANTOMETRY, *f.* The art of measuring.

PANTOMIME, *f.* [from the Gr. παν, παντος, all, and μιμος, a mimic.] One who has the power of universal mimicry. One who can imitate all kinds of actions and characters by signs and gestures, without speaking.—The *pantomimes* made a part in the theatrical entertainments of the ancients; their chief employment was to express, in gestures and action, whatever the chorus sung, changing

4 T ing

ing their countenance and behaviour as the subject of the song varied. *Chambers*.

Not that I think those *pantomines*,
Who vary action with the times,
Are less ingenious in their art
Than those who duly act one part.

Hudibras.

The word seems not to have been anglicised very early in the seventeenth century. Dr. Johnson's earliest example (above) is from *Hudibras*. Bacon and Ben Jonson use the Latin form, *pantomimi*.—"There be certain *pantomimi*, that will represent the voices of players." *Nat. Hist. Cent. 3. No. 240*.—"After the manner of the old *pantomimi*, they dance over a distracted comedy of love." *Masque of Love's Triumph*, &c. 1630.

Mr. d'Israeli distinguishes between the Mimi and the Pantomimi of the ancients. "The *Mimi* were an impudent race of buffoons, who excelled in mimicry, and, like our domestic fools, were admitted into convivial parties to entertain the guests; from them we derive the term, *mimetic art*. Their powers enabled them to perform a more extraordinary office; for they appear to have been introduced into funerals, to mimic the person, and even the language, of the deceased. Suetonius describes an archimimus, accompanying the funeral of Vespasian. This archimime performed his part admirably, not only representing the person, but imitating, according to custom, *ut est mos*, the manners and language of the living emperor. He contrived a happy stroke at the prevailing foible of Vespasian, when he inquired the cost of all this funeral pomp? 'Ten millions of sesterces!' On this he observed, that, if they would give him but a hundred thousand, they might throw his body into the Tiber.

"The *Pantomimi* were quite of a different class. They were tragic actors, and usually mute; they combined with the arts of gesture, music and dances of the most impressive character. Their silent language has often drawn tears by the pathetic emotions they excited: 'Their very nod speaks, their hands talk, and their fingers have a voice,' says one of their admirers. Seneca, the father, grave as was his profession, confessed his taste for pantomimes had become a passion; and, by the decree of the senate that the Roman knights should not attend the pantomimic players in the streets, it is evident that the performers were greatly honoured. Lucian has composed a curious treatise on pantomimes.

"These pantomimics seem to have been held in great honour. The tragic and the common masks were among the ornaments of the sepulchral monuments of an archimime and a pantomime. Montfaucon conjectures that they formed a select fraternity.

"The particoloured hero, with every part of his dress, has been drawn out of the greatest wardrobe of antiquity; he was a Roman mime. Harlequin is described with his shaven head, *rasis capitibus*; his sooty face, *fuligine faciem obduci*; his flat unthod feet, *planipedes*; and his patched coat of many colours, *mimi centunculo*. Even *Pullicinella*, whom we familiarly call Punch, may receive, like other personages of not greater importance, all his dignity from antiquity; one of his Roman ancestors having appeared to an antiquary's visionary eye in a bronze statue: more than one erudite dissertation authenticates the family-likeness; the nose long, prominent, and hooked; the staring goggle eyes; the hump at his back and at his breast; in a word, all the character which so strongly marks the Punch-race, as distinctly as whole dynasties have been featured by the Austrian lip and the Bourbon nose.

"The genealogy of the whole family is confirmed by the general term, which includes them all; for our *Zany*, in Italian *Zanni*, comes direct from *sannio*, a buffoon; and a passage in Cicero de Oratore, paints Harlequin and his brother-gesticulators after the life; the perpetual trembling motion of their limbs, their ludicrous and flexible gestures, and all the mimicry of their faces: *Quid enim*

potest tam ridiculum quam Sannio esse? Qui ore, vultu, imitandis motibus, voce, denique corpore ridetur ipso. 'For what has more of the ludicrous than Sannio? Who, with his mouth, his face, imitating every motion with his voice, and, indeed, with all his body, provokes laughter.'

"The Harlequin in the Italian theatre has passed through all the vicissitudes of fortune. At first he was a true representative of the ancient Mime; but, during the fourteenth and fifteenth centuries, he degenerated into a booby and a gourmand, the perpetual butt for a sharp-witted fellow, his companion, called Brighella; the knife and the whetstone. Harlequin, under the reforming hand of Goldoni, became a child of nature, the delight of his country." *Curiosities of Literature*, vol. iii.

PANTOMIME is also very properly used for the delight of our young folks; a collection of scenes exhibited in gesture and dumb-show.—He put off the representation of *pantomimes* till late hours on market-days. *Arbutnot*.

The characters of the pantomime, as well as of the old Italian comedy, are well explained by Goldoni in his "history of the four masks."

"Comedy, which has at all times been the favourite spectacle of civilized nations, had shared the fate of the arts and sciences, and been swallowed up in the ruin of empires and the decline of letters: but the germ of comedy was never quite extinct in the fertile imagination of the Italians. The first who laboured to revive it, being disappointed, during a dark age, in skilful writers, had the boldness to compose plans, to divide them into acts and scenes, and to utter as impromptus, conversations, thoughts, and pleasantries, which were previously concerted. Those who could read (and the rich were not of the number) observed, that the comedies of Plautus and Terence always contained fathers who were dupes, debauched sons, amorous girls, lying valets, and corrupt maid-servants; and, traversing the different cantons of Italy, they took their fathers at Venice and at Bologna, their valets at Bergamo; their enamoured youths and maids, and their soubrettes, in the states of Rome and Tuscany.

"We must not wait for written proofs of this reasoning, because we are speaking of an age in which writing was nearly unknown; but I prove my assertion in this manner. The Pantaloon has always been Venetian, the Doctor a Bolognese, and the Harlequin and Clown have ever been from Bergamo; from these places, the actors took those comic characters which are known to us by the name of the four Italian masks. I advance these remarks not entirely from my own conception: I am in possession of a manuscript of the fifteenth century, in good preservation, bound in parchment, which contains a hundred and twenty subjects or canvasses of Italian pieces, called *Comedies of the Art*; and of which the principal basis consists invariably of a Pantaloon, a Venetian Merchant; the Doctor, a Lawyer of Bologna; Brighella and Harlequin, valets of Bergamo; the first quick and active, the other heavy. Their antiquity and permanent existence prove their origin. With regard to their employment, the Pantaloon and the Doctor, whom the Italians call the two old men, represent the part of fathers and other venerable characters, (*les rôles à manteau*.) The first is a merchant, because Venice was in those ancient times the richest and most extensive commercial country in Italy. He has ever preserved the ancient Venetian costume. The black robe and woollen bonnet are yet worn at Venice; while the red waistcoat, breeches cut like drawers, and red stockings and slippers, represent exactly the dress of the ancient inhabitants of the Adriatic lagoons; and the beard, which was a great ornament in those distant ages, has been carried to a grotesque extreme in these latter days. The second old man, called the Doctor, has been selected from the legal profession for the purpose of contrasting the learned with the commercial man; and he is from Bologna, because an university existed in that city, which, with all the ignorance of the time, yet

yet adhered to the charges and emoluments of professors. His dress preserves the ancient costume of the bar of Bologna, which is nearly the same to this hour; and the singular mask, which covers the forehead and nose, has been imitated from a wine-mark which deformed the face of a lawyer in those days. This tradition yet exists among the amateurs of the comedy of art. The Brighella and Harlequin, called in Italy the two Zanis, have been borrowed from Bergamo. The adroitness of the first, and the extreme heaviness of the second, are proofs of this assertion; because in no other country do we find these two extremes in the class of the people. Brighella represents an intriguing, roguish, dishonest, valet. His dress is a kind of livery; and his tawny mask is a satire on the complexion of the inhabitants of those lofty mountains, scorched by the heat of the sun. The Harlequins also have their different names: but they are always natives of Bergamo, heavy and clownish; and their dress represents a poor devil who picks up pieces of different stuffs and colours to mend his clothes. The hat corresponds with their beggary; and the tail of a hare, with which it is decorated, is to this day the usual ornament of the peasants of Bergamo." *Memoirs of Goldoni, by himself; Paris, 1814.*—It will readily occur to the reader, that the two last-mentioned personages are exactly reversed in this country: the Harlequin is the active run-about; and the Brighella is the Clown, or servant.

PAN'TOMIME, *adj.* Representing only in gesture and dumb-show.—A *phantomime* dance may frequently answer the same purpose; and, by representing some adventure in love or war, may seem to give sense and meaning to music, which might not otherwise appear to have any. *Smith on the Init. Arts.*

PANTOMIMIC, or PANTOMIMICAL, *adj.* Representing only by gesture or dumb-show.

PAN'TON, in geography, a township of America, in Addison county, Vermont, on the east side of lake Champlain, about eighty-seven miles north of Bennington; containing 520 inhabitants.

PAN'TON, *f.* A shoe contrived to recover a narrow and hoof-bound heel. *Farrier's Dict.*

PAN'TRY, *f.* [*paneterie*, Fr. *panarium*, Lat. A place formerly used solely for the keeping of bread, as the etymology (*panis*) shows. *Malone.*] The room in which provisions are deposited.—The Italian artizans distribute the kitchen, *pantry*, bake-house, under ground. *Wotton on Architecture.*—What work they make in the *pantry* and the larder! *L'Esrange.*

PANU'CO, a town of South-America, in the province of Tucuman: fifteen miles west of St. Fernando.

PANUCO, a river of North-America, which runs into the gulf of Mexico twenty-one miles east-south-east of Panuco, in lat. 22.40. N. lon. 98. 36. W.

PANU'CO, or ST. STILVA'RA DEL PUER'TO, a town of Mexico, and capital of the province of Guasteca or Panuco, situated on a river of the same name, navigable for barks up to the town. It contains about 500 families, and is the see of a bishop: 190 miles north-north-east of Mexico. Lat. 23. 23. N. lon. 99. 6. W. See GUASTECA, vol. ix.

PANVILA'O, a town on the south coast of the island of Luzon. Lat. 14. 2. N. lon. 121. 36. E.

PANVIN'IO (Onofrio), a very learned and industrious historian and antiquary, was born at Verona in 1529. From his childhood he manifested an insatiable thirst for study; and, to indulge it, he entered into the order of Augustines. By the general of that order he was sent to Rome to complete his studies; and in 1553 he was appointed to instruct the novices in that city in the sciences. In the following year he was sent to Florence, to teach scholastic theology; but, that science not being to his taste, he obtained permission not only to be free from the charge, but to live at large out of the cloister. He passed

some time at Venice, where he printed one of his works; but his ordinary abode was at Rome, where he was first patronised by cardinal Marcello Cervini, whose pontificate, under the name of Marcellus II. was too short to contribute to his advancement. He thence passed into the court of cardinal Alexander Farnese, with whom he travelled into Sicily in 1568, where a violent disease carried him off at the early age of thirty-nine. A monument to his honour was erected in the church of St. Augustine at Rome.

Very few instances are to be met with in literary biography, of so many proofs of extensive erudition and indefatigable industry left by one whose career was restricted to such narrow limits. Besides his published works, which form a numerous catalogue, he left a still greater number in manuscript, either begun or completed. One of the first objects of his labours was Roman history and antiquities. The "Fasti Consulares," though first brought to light by Sigonius, were published and illustrated with notes by him, in a folio volume printed at Venice in 1557. He published treatises also "De antiquis Romanorum Nominibus; De Principibus Romanis; De Republica; De Triumphis et Ludis Circensibus; Topographia Romæ." All these are valuable performances; not merely compilations of passages from different authors, but founded in great measure upon ancient inscriptions, of which he had collected and copied near three thousand. He had an intention of publishing this collection, but was prevented by death; and, as no vestiges of it appear among his MSS. it is conjectured by the marquis Maffei that it came into the hands of Martin Smetius, who published at Antwerp a collection of inscriptions, which was the ground-work of Gruter's later work. Panvinio was likewise a profound investigator of sacred or Christian antiquities. Of his published works in this class are treatises "De Ritu Sepeliendi Mortuos apud veteres Christianos; De antiquo Ritu baptizandi Catechumenos; De Primatu Petri; Chronicon Ecclesiasticum; De Episcopatus, Titulis, et Diaconis Cardinalium; Annotationes et Supplementa ad Platinam de Vitis Pontificum; De septem præcipuis Urbis Romæ Basilicis; De Bibliotheca Vaticana." He had undertaken a general ecclesiastical history, for which he had collected matter sufficient to fill six large manuscript volumes; they are preserved in the Vatican, and it cannot be doubted that they afforded much assistance to cardinal Baronio in his great work. Panvinio also consecrated part of his labour to his own order, of which he wrote a Chronicle; nor did he neglect the history and antiquities of his native city, Verona, of which he composed eight books, printed many years after his death. *Gen. Biog.*

PANUR'GIA, *f.* [from the Gr. *παν*, all, and *εργον*, work.] Subtilty, skill. *Phillips.*

PAN'WELL, a town of Hindoostan, in Vishapour: sixty miles west-north-west of Poonah.

PANY'ASUS, in ancient geography, a river of Macedonia, the mouth of which is placed by Ptolemy between Dyrrhachium and the mouth of the river Apus.

PAN'ZA, or PENGGA, a town of Congo, in the province of Bamba.

PANZA'NO, a town of Etruria: fourteen miles south of Florence.

PAN'ZEN, a town of Bohemia, in the circle of Leitmeritz: fifteen miles north-north-east of Leitmeritz. Lat. 50. 44. N. lon. 14. 25. E.

PAN'ZERA, *f.* in botany. See DIMORPHA falcata.

PA'O, a river of South-America, which rises near Valencia, in the province of Caraccas, and after a southerly course of about 100 miles, joins the Bariquemento in lat. 8. 20. N. and the streams united form the Portuguese.

PA'O, a town of Corea: thirty miles south-east of Ou-tchuen.

PA'O, a town of China, of the third rank, in Se-tchuen: fifteen miles north-north-west of Hoel.

. PAO-FONG',

PAO-FONG', a town of China, of the third rank, in the province of Ho-nan: forty-five miles east-south-east of Hiu-tcheou.

PAO-KANG', a town of China, of the third rank, in Hou-quang: forty-five miles west-south-west of Siang-yang.

PAO-KI', a town of China, of the third rank, in Chen-si: fifteen miles south-west of Fong-tsiang.

PAO-KING', a city of China, of the first rank, in Hou-quang: 832 miles south-south-west of Peking. Lat. 27. 4. N. lon. 111. E.

PAO DE NA'O, a town on the coast of Africa, near the river Camarones, belonging to the Portuguese.

PAO-NING', a city of China, of the first rank, in Setchuen, on the Kia-ling river: 700 miles south-south-west of Peking. Lat. 31. 3. N. lon. 105. 35. E.

PAO-NGAN', a town of China, of the third rank, in Chen-si: thirty-seven miles north-west of Yen-ngan.

PAO-NGAN', a city of China, of the second rank, in Pe-tche-li, on the river San-cam: sixty-two miles north-west of Peking. Lat. 40. 22. N. lon. 114. 41. E.

PAO-TCHING', a town of Corea: thirty miles south of Koang-tcheou.

PAO-TCHU'EN, a town of Corea: twenty-eight miles south-south-west of Hoang-tcheou.

PAO-TCHU'EN, a town of Corea: twenty-three miles east of King-ki-tao.

PAO-TE', a city of China, of the second rank, in Chan-si, on the Hoang: 275 miles west-south-west of Peking. Lat. 39. 40. N. lon. 110. 24. E.

PAO-TI', a town of China, of the third rank, in Pe-tche-li: forty-two miles east-south-east of Peking.

PAO-TIM', a town of China, of the third rank, in Pe-tche-li: forty-two miles east of Pao-tiing.

PAO-TING', a city of China, of the first rank, in Pe-tche-li. It is the residence of a viceroy, and the most considerable city in the province next to Peking. It has twenty towns under its jurisdiction; three of the second, and seventeen of the third, class. The country round it is pleasant, and inferior in fertility to no part of China: seventy-seven miles south-south-west of Peking. Lat. 38. 54. N. lon. 115. 14. E.

PAO-YN', a town of China, of the third rank, in Kiang-nan: fifteen miles south of Hoai-ngan.

PAO'LI (Pascal), a distinguished character in the annals of patriotism, was born in Corsica in 1726. His father, Giacinto Paoli, who had taken an active part in the public affairs of that island, retired with his family to Naples after the failure of his attempts to free his countrymen from the tyranny of the Genoese. Pascal received his education at the Jesuits-college of that city, where he made a rapid progress in his studies, and displayed an understanding equally solid and capacious. In the year 1755, on the death of Gaffori, who had acted as the chief of the natives still in arms against their oppressors, the Corsicans were induced by the high reputation of Pascal Paoli to send him an invitation to come and take upon himself the vacant post. After a due consideration of the arduous task that lay before him, he resolved to comply with his country's call, and devote himself to her service; and, having taken a pathetic farewell of his venerable father, he embarked for the island, where he was formally invested with the chief command in July 1755. At this period the Genoese were in possession of a great part of the country; while the Corsicans, in a state of division and insubordination, destitute of the necessary supplies of arms and money, were able to carry on only a desultory war against their invaders. At the same time their long habits of resistance to regular government had rendered them little better than a ferocious banditti, not less turbulent and vindictive among one another than sanguinary towards the common foe. Paoli's first object was to unite and strengthen their efforts against the Genoese, whom they soon expelled from the inland country, and confined to the sea-coasts. Then, taking advantage

of this temporary tranquillity, he set about the more difficult task of introducing the restraints of law and government among his people, and persuading them to forego the rooted practice of private revenge. Aiming still further to soften and civilise their manners, he provided means for a national education, and founded an university at Corte. He also attended to the external prosperity of the island, by promoting agriculture, manufactures, and commerce, as far as his means would allow.

Having, by the union of firmness with gentleness, and by himself setting the example of the civil virtues he wished to introduce, brought his plans to a considerable degree of perfection, he again turned his thoughts to the expulsion of the Genoese. A small marine was fitted out to impede their communication with the island, and strong measures were taken to harass them in their quarters. The Genoese government, on the other hand, issued insidious manifestoes with the view of dividing their opponents, and no prospect appeared of their abandoning their claims upon the island. In this emergency Paoli and his council addressed, in 1761, a memorial to the different sovereigns of Europe, for the purpose of inducing some of them to become their protectors. But appeals to the principles of freedom were not likely to obtain favour in royal cabinets; and not only was no interference produced in their behalf, but the court of France, in 1764, entered into a treaty with the Genoese for supplying them with a force to garrison the towns yet remaining in their hands. It was indeed stipulated, that the French troops should act only defensively, but their preference effectually prevented any progress towards freeing the island; and the only military transaction that took place during the four years in which this treaty subsisted, was the conquest by the Corsicans of the isle of Capraia.

At the expiration of the term, a new treaty was formed, by which the republic of Genoa transferred its pretended sovereignty over Corsica, to the king of France, for 40,000,000 of livres; and ceded to him the towns then garrisoned by his troops. The remainder of the island was either to be conquered by the French, or obtained by negotiation. This was a thunderstroke to the Corsican patriots, but their noble leader remained firm. Although he was tempted by the offer of being confirmed in his supreme authority, only on condition of holding it under the French government, he did not hesitate to reject such a disgraceful proposal, warmly declaring, that "the rocks which surrounded him should melt away, ere he would betray a cause which he held in common with the meanest Corsican." A rigorous war thenceforth commenced, in which the French, having received a considerable reinforcement, entered upon offensive operations. Notwithstanding some temporary success, they had the mortification soon to undergo various defeats from this undisciplined rabble, as they termed the Corsicans; and in particular, a French general, De Lude, was obliged to capitulate at his strong post of Borgo, with all his infantry, artillery, and ammunition. Clement Paoli, brother to Pascal, distinguished himself in several of these actions.

The French minister, Choiseul, considering the honour of his nation as at stake in this warfare against a petty island, resolved to send such a force as would ensure success; accordingly a large reinforcement under the orders of the count de Vaux was landed at Corsica in 1769. The patriots still kept a firm countenance, and made a vigorous resistance; but were in the end defeated with great slaughter. Paoli, left with only five hundred men, was surrounded by the French, who were anxious to get possession of his person; but he cut his way through them, and took shelter in a convent on the seashore. Thence, with several of his friends, he embarked on-board an English vessel for Leghorn. After continuing some time in that port, he pursued his way to England, where he was received with all the sympathy and respect due from freemen to a patriot who had so nobly supported the cause of liberty. Dumourier, who afterwards made a

Engraved for the Encyclopædia Londinensis 1810.

figure in the revolution of his own country, served at this period against the Corsicans, with the rank of adjutant-general; and, in his own Memoirs, published a few years since, he pays very high compliments both to the people of the island and their chief; "It is astonishing," he says, "that this handful of islanders, destitute of artillery, fortifications, magazines, and money, should have kept France at bay during two campaigns, although she had no other enemy to cope with. But liberty doubles the valour and strength of man."

The case of the oppressed Corsicans had excited much interest in this country; and, although the government had not thought it prudent to interpose, in their favour, a subscription had been raised by some private persons for their aid. Paoli was introduced at court; and the duke of Grafton, then prime minister, obtained for him a pension of 1200*l.* a-year. This was assuance to one of his economical habits; and he liberally shared it with his companions in exile. From this time the ex-general lived a retired life, devoting himself chiefly to the cultivation of literature. During his retirement, which lasted more than twenty years, he was introduced to Dr. Johnson by Mr. Boswell, who had visited the general in 1765, while he was in Corsica; and who speaks of the interview with pleasure, saying, "The general spoke Italian, and Dr. Johnson English, and understood one another very well, with a little aid of interpretation from me, in which I compared myself to an isthmus, that joins two great continents."

At length the revolution, that promised to raise France to the rank of a free state, extended its influence to Corsica; and the national convention passed a decree by which that island was numbered among the departments of France, and entitled to all the privileges of the new constitution. The return of Paoli to the dignified station of its chief, was the first wish of his liberated countrymen; and Paoli could not resist their entreaties, which were enforced by the solicitations of the French assembly. He resigned his pension from the English court, took a grateful leave of the country in which he had been so hospitably entertained, and in the month of April, 1790, presented himself at the bar of the national assembly at Paris, together with the Corsican deputies. He was greeted with the enthusiasm which then attended upon every person and event connected with the cause of liberty; and, having taken the oaths as a subject of the *great nation*, repaired to Corsica to execute the high charge to which he was so honourably called.

The political horizon, however, soon became darkened. The violent and sanguinary factions which successively ruled in the centre of France, spread tumult and disorder over the whole circumference, and loosened all the bands of society. Parties arose in the different districts of Corsica; and a disposition was soon manifested of breaking off all connexion with France, and declaring for independence. After due deliberation, Paoli thought proper to concur in this design, of which the clergy, in particular, were ardent promoters. He put himself at the head of the insurgents, and drove from the field the French troops and their adherents. He was then reinvested with his former dignities of president of the consulta, and commander-in-chief of the island, and took measures to complete the counter-revolution. The national assembly, highly exasperated at this conduct, proclaimed him a rebel, and set a price on his head; but he was protected by the attachment of his countrymen. Sensible, however, that it would be impossible for a small island permanently to withstand the power of France without foreign support, he resolved upon an expedient, which, whilst it was a renunciation of independence, promised to secure all the advantages of real liberty. This was an union of Corsica with the crown of Great Britain, under a constitution similar to that of the latter country. An assembly of deputies, to consider of this project, met in June 1794, which, with great unanimity, after voting

Vol. XVIII. No. 1248.

thanks to Paoli, made a declaration of the separation of Corsica from France, and its union with the British crown. In consequence, sir Gilbert Elliot (earl of Minto) was sent to take possession of the government, as viceroy of the king of England; and Paoli, resigning his official dignities, became a private citizen. How it happened that he was not appointed to some distinguished office under the British government, can only be conjectured; (nor is it now of much consequence to inquire, since we kept possession of the island only two years;) but the well-earned reputation of his earlier years for honour and true patriotism, affords a solid ground for supposing that he acted as consistently as the very difficult circumstances in which he was placed would permit. He soon after returned to England; and, having unfortunately lost the bulk of his property through the failure of a house of Leghorn to which it was entrusted, he passed some time in great privacy. When his necessities, however, were known, there is reason to believe that they were promptly relieved, and that his pension was restored, and continued to the last. He died near London, February 5, 1807, in the 81st year of his age.

Few foreigners, however distinguished, have been so much caressed in England as general Pascal Paoli. By living in habits of familiarity with men of letters, his name and exploits acquired fresh celebrity; and Boswell, Goldsmith, Johnson, Macaulay, and lord Littleton, although differing in almost every thing else, most cordially united in his praise. Abroad too, his reputation was greatly respected; and the eulogiums of such a man as Rousseau, then in the zenith of his reputation, was alone sufficient to ensure reputation throughout the rest of Europe. While his laurels were still green, it was usual to compare him to Timoleon and Epaminondas; and it was appositely remarked by an English minister, that the same thing might have been said of him as had been formerly uttered by the cardinal de Retz in respect to the famous Montrose, "that he was one of those men, who are no longer to be found any where but in the Lives of Plutarch."

That the Corsican chief was a great man, cannot well be denied; but it is the opinion of those, who have enjoyed an opportunity of studying his character, that he was a politician rather than a soldier; and that he shone in council more than in arms. And to this effect, Dumas, whose Memoirs we have already quoted, observes, "He displayed great genius, and a noble consistency; had he been endowed with *military talents*, had he known how to have instructed his countrymen in that species of hostility best suited to the natural bent of their genius, he would have destroyed our little army in 1768, and done us much more harm than we experienced in 1769."

Among his countrymen he was adored; and, to support his superiority, he made use of those arts which have usually passed under the name of *pious frauds*. These, perhaps, appeared indispensably necessary for the government of barbarians. Accordingly, like Numa, he pretended to a direct communication with the Deity; and also affected, on all occasions, after the manner of the heroes of old, to be surrounded by dogs of a particular breed, which were indeed necessary to preserve him from assassination.

It is not a little remarkable, that Corsica, an island which seems to have been equally despised both by the ancients and moderns, should have produced two men; one of whom engaged the attention of all Europe towards the middle of the last century; and the other was, unhappily for the repose of mankind, destined to regulate its fate at the beginning of the present. We have only to add, that Corsica remains in the possession of France by the peace of 1814. *Monthly Mag.* 1807. *Boswell's Account of Corsica and Life of Johnson.* *Athenæum*, vol. i. *Gent. Mag.* 1768.

PAO'LO, *f.* A small silver coin at Florence, Rome, and other places in Italy.

PAO'LO (Agosfino), a learned ecclesiastical composer of music, scholar of Bernardo Nanini, and successor in the pontifical chapel to Soriano. Antimo Liberati speaks of him as one of the most scientific and ingenious composers of his time, in every species of music then cultivated: and tells us, that, while he was maestro di capella of St. Peter's church at Rome, he astonished the musical world with his productions for four, six, and eight, choirs or chorusses; some of which might be sung in four or six parts only, without diminishing or enervating the harmony. Padre Martini, who bears testimony to the truth of this eulogium, has inserted an Agnus Dei, in eight parts, of this composer, which is truly a curious production: three different canons being carried on at the same time, in so clear and natural a manner, both as to melody and harmony, that this learned father, who had been long exercised in such arduous enterprises, speaks of it as one of the greatest efforts of genius and learning in this most difficult kind of composition. *Burney*.

PAO'LO (St.), a river of Sicily, which runs into the sea, on the east coast, in lat. 37. 16. N. lon. 15. 12. E.—Also, a small island, near the coast of Naples, in the gulf of Tarento. Lat. 40. 42. N. lon. 17. 6. E.—Also, a town of Naples, in the Capitanata: three miles south-east of Dragonera.

PAO'LOS, a town of Asiatic Turkey, in the province of Sivas: fifteen miles west of Sivas.

PAO'OM, one of the smaller New Hebrides, in the South Pacific Ocean. What was comprehended under this name, appeared to Capt. Cook to be two islands, something like a separation being seen. Lat. 16. 30. S. lon. 168. 20. W.

PA'OS, a town of Portugal, in the province of Beira: sixteen miles north-west of Viseu.

PAOU'LA, a town of Naples, in Principato Ultra: four miles north-east of Benevento.

PAOWAH', a town of Hindoostan, in Bahar: five miles south of Bahar.

PAP, *f.* [*papa*, Ital. *pappe*, Dut. *papilla*, Lat.] The nipple; the dug sucked.—In weaning young creatures, the best way is never to let them suck the *paps*. *Ray on the Creation*.—That Timothy, Trim, and Jack, were the same person, was proved, particularly by a mole under the left *pap*. *Arbutnot*.

An infant, making to the *paps*, would press,
And meet, instead of milk, a falling tear. *Dryden*.

Food made for infants, with bread boiled in water.—Let the powder, after it has done boiling, be well beaten up with fair water to the consistence of thin *pap*. *Boyle*.

The noble soul by age grows lustier;
We must not starve, nor hope to pamper her
With woman's milk and *pap* unto the end. *Donne*.

The pulp of fruit. *Ainsworth*.

To PAP, *v. a.* To feed with *pap*:

O that his body were not flesh, and fading!
But I'll so *pap* him up: nothing too dear for him.

Beaumont and Fletcher.

PAP CAS'TLE, a very ancient edifice, long since demolished, was situated in the parish of Bridekirk, two miles from Cockermouth, Cumberland, on the other side of the Derwent. Its Roman antiquity is proved by several monuments; and a large green stone vessel found here, with little images upon it, is supposed to have been formerly a Danish font for dipping of infants, and which has been since used at Bridekirk, in the neighbourhood, for their sprinkling.

The name of *Pap-castle* seems to be contracted from Pipard its owner: it is said to have been demolished, and the materials employed to build Cockermouth-castle. See COCKERMOUTH, vol. iv.

In Gough's Camden, we find two letters from Mr. Routh to Mr. Gale, dated Jan. 16, 1741, and Apr. 13, 1743, describing the ruins that were discovered about

that time, and the antiquities that were dug up. Dr. Stukeley says, the Roman castrum lies on the top of the hill above the village; and he traced its whole circumference, and a bit of the Roman wall by the river-side going to Wigton, where the ditch is plainly visible, though half filled-up with the rubbish of the wall. A subterraneous vault, floored with large slabs of free-stone, was found in the pasture of the south-east angle. The name of *Boroughs* includes both closes where it stood; and they find stones and slates with iron pins in them, coins, &c. on the whole spot below it, towards the water-side. It was a beautiful and well-chosen plan, on the south-west side of a hill, a noble river running under, and pretty good country about it. He supposes its ancient name *Derwentio*, derived from the Derwent.

PAPA', *f.* [Lat. Ital. and Fr.] A fond name for father, used in many languages.—Where there are little masters and misses in a house, bribe them, that they may not tell tales to *papa* and mamma. *Swift*.—A spiritual father. See PAPE.

PAPA, a town of Hungary: twenty-five miles south of Raab, and forty-five west of Buda.

PAPA STOU'R, one of the Shetland islands of Scotland, is situated about a mile westward from the main land. This island extends about two miles in length, and one in breadth. Its soil is a rich sand, producing excellent pasturage-grass, and even good crops of oats, with beans and potatoes. Along the coast are numerous small *voes*, or harbours, which afford a safe retreat to the boats employed in the Shetland islands. Here is a remarkable cave, by which the sea flows for a considerable distance into the interior of the island, under the rocks. The beach, being admirably adapted for drying fish, is occupied by a number of houses appropriated to that purpose.

PAPA STRON'SA, one of the Orkney islands, off the coast of Scotland, is situated on the north-east quarter of the isle of Stronfa. Though little more than three miles in circumference, its surface is remarkably level, and equally beautiful as fertile. Here are the ruins of two ancient chapels, one dedicated to St. Bride, and the other to St. Nicholas. On an eminence called Earl's Knoll, are several graves, and some vestiges of buildings which formerly belonged to one of the ancient earls of Orkney.

PAPA WES'TRA, one of the Orkney islands, about one mile to the north of Westra. It is nearly four miles long, and one broad; and scarcely yields in fertility of soil to any district in Scotland. At its south-eastern extremity is a beautiful lake of fresh water, the centre of which is adorned with an islet, where are the ruins of the once-noble chapel of St. Tredwall, to whom superstition, till lately, attributed many wonderful and miraculous works. *Barry's Hist. of the Orkneys*.

PAPACH'TON, a river of America, which rises in New York, and joins the Cookquago to form the Delaware.

PA'PACY, *f.* [*papat*, *papauté*, Fr. from *papa*, Lat. the pope.] Popedom; office and dignity of bishops of Rome.—Now there is ascended to the *papacy* a personage, that, though he loves the chair of the *papacy* well, yet he loveth the carpet above the chair. *Bacon*.

PAPAGAY'O, a river of Mexico, which runs into the Pacific Ocean twenty-five miles north of Acapulco in lat. 17. 40. N. lon. 101. 46. W.

PAPAGAY'O BAY, or PARROT BAY, a bay on the west coast of Mexico. Lat. 11. 10. N. lon. 87. 36. W.

PAPAKUN'K, a town of New York, on the Papach-ton. Lat. 42. 5. N. lon. 74. 58. W.

PA'PAL, *adj.* Popish; belonging to the pope; annexed to the bishopric of Rome.—The pope released Philip from the oath, by which he was bound to maintain the privileges of the Netherlands; this *papal* indulgence hath been the cause of so many hundred thousands slain. *Raleigh*.

PA'PALIN,

Naked-stalked Poppy.

Great Oriental Poppy.

PAPALIN, *f.* A papist; one devoted to the pope. *Not now in use.*—No less divided in their profession than we and the *papalins*. *Sir T. Herbert's Trav.*—In opposition to bishops, the highest *papalins* talk most of the sovereign power of the people; because they hold the interest of the pope to be upheld by their veneration. *Puller's Mod. of the Ch. of Eng.*

PAPALITY, *f.* The papacy. *Cole.*

PAPALLACLA, a town of South America, in the province of Quito: fifty miles north-west of Archidona.

PAPALOAPA'N, a river of Mexico, now called *Alvarado*, which see.

PAPALQUITAN, a town of Mexico, in New Biscay: 130 miles north-west of Durango.

PAPAMO'W, a town of Hindoostan: eight miles north Allahabad.

PAPANAU'D, a town of Hindoostan, in the Carnatic: twenty-five miles south-south-east of Tanjore.

PAPAS, a lake of South America: forty miles south of Popayan.

PAPAS ADAS'SI, or **PRINCE'S ISLANDS**, a cluster of small islands, in the north-east part of the island of Marmora, at the entrance of the straits of Constantinople: eight miles south of Constantinople.

PAPAS-TLI, a town of European Turkey, in Romania: thirty-two miles north of Adrianople.

PAPA'VER, *f.* [so called, according to the most learned etymologists, because it was commonly mixed with the pap, *papa*, given to children, in order to procure sleep. This plant and its name have ever been associated with the idea of sleep in most languages, in poetry and philosophy, in history and fable. Its juice is still the best opiate known, and in the most general use.] *The Poppy*; in botany, a genus of the class polyandria, order monogynia, natural order of rhœadææ, (papaveracæ, *Juss.*) Generic characters—Calyx: perianthium two-leaved, ovate, emarginate: leaflets subovate, concave, obtuse, caducous. Corolla: petals four, roundish, flat, spreading, large, narrower at the base; alternately less. Stamens: filaments numerous, capillary, much shorter than the corolla; antheræ oblong, compressed, erect, obtuse. Pistillum: germ roundish, large; style none; stigma peltate, flat, radiate. Pericarpium: capsule crowned with the large stigma, one-celled, half-many-celled, opening by many holes at the top under the crown. Seeds numerous, very small. Receptacles, longitudinal plait; the same number with the rays of the stigma, fastened to the wall of the pericarpium.—*Essential Character.* Calyx two-leaved; corolla four-petalled; capsule one-celled, opening by holes under the permanent stigma. The seed-vessel differs in shape in different species, from globose to oblong; and the rays of the stigma differ greatly in number, according as the shape of the capsule appropriated to each species is more or less oblong and narrow. The twelve species are commodiously divided into two sections, distinguished by the roughness or smoothness of the capsule.

I. With hispid Capsules.

1. *Papaver hybridum*, or bastard-poppy: capsules subglobose, torose, hispid; stem leafy, many-flowered. The leaves of the bastard-poppy are much smaller than those of the common corn-poppy, and are cut into much finer segments. The stalks are slender, little more than a foot high, and not so branching; the flowers are not so large, and of a deep purple colour, seldom lasting more than one whole day. The oblong prickly capsules are filled with small black seeds. Native of some of the southern parts of Europe, and of England, among corn; as near Norwich, and Wells in Norfolk; the parks, Oxford and Eynsham, Oxfordshire; about Durham. It flowers in June and July.

2. *Papaver argemone*, or long prickly-headed poppy: capsules club-shaped, hispid; stem leafy, many-flowered. Leaves finer cut and smaller than those of the common sort, but not so fine as those of the preceding. Stalks not

so high as either, seldom having many branches. Flowers not half so large, of a copper colour, and falling away in few hours. They appear in May, and are succeeded by long slender channelled capsules, filled with small black shrivelled seeds. The capsule has the same number of cells as the stigma has rays; it is ribbed, and the strong hairs or bristles on it are white and point upwards. Like most of the other poppies, it usually grows in corn-fields, and is not unfrequent about London. It flowers at the beginning of June, and is often overlooked from the extreme fugacity of its petals. It is a native not only of most parts of Europe, but of the Levant. This and the preceding are annual plants.

3. *Papaver alpinum*, or alpine prickly-headed poppy: capsule hispid; scape one-flowered, naked, hispid; leaves bipinnate. Stalks about a foot high, sustaining one small yellow or copper-coloured flower, succeeded by a roundish prickly head. The poppy of the Alps is a little perennial plant-hairy all over; the stems are naked and simple, with a bundle of leaves at the base; the leaves are winged; the first and the last leaflets are simple, the middle one larger, often trifid; the corolla is yellow, reddish or whitish; the capsule is oblong, with the upper part five-cornered. It grows in high rocky places, exposed to the wind, and bare of grass.

According to Haller, the leaves are commonly hirsute, but in the Swiss plant smooth; the stem a long span in height; the calyx brown, and very hirsute; the corolla small, flaccid, white with a yellow claw, the yellowness frequently diffusing itself over the whole petal. Under the flower, as in *P. argemone*, is a pencil of hairs of a dark-brown colour. The whole plant, when fresh, has a strong smell of musk. Neither Haller nor Scopoli distinguish this from the next species. Native of Switzerland, Austria, Carniola, Dauphiné, Piedmont, and Silesia.

β. Scopoli remarks, that the variety with a yellow flower is not so hairy; that the segments of the leaves are more long and slender, with the last only trifid; and the stamens from sixty to seventy: he ascribes to this the synonym from Dillenius which belongs to *nudicaule*.

γ. The variety with a white flower is, according to him, a larger and more hairy plant, with paler leaves, all the pinnae trifid and wider, with the claws of the petals greenish. Seguier's figure seems to belong to this; the yellow variety not having sessile gashed pinnae.

4. *Papaver nudicaule*, or naked-stalked prickly-headed poppy: capsules hispid; scape one-flowered, naked, hispid; leaves simple, pinnate-sinuate. Roots slender, fibrous, (annual or biennial.) Root-leaves many, hispid, the lowest broader and shorter, less deeply divided into fewer and broader segments, the leaves next above are divided into many narrower and longer segments; glaucous green, especially underneath. From among these leaves arises a single naked stalk, a long span or a foot in height, somewhat glaucous, hispid, sustaining one yellow flower of a middling size, the two inner petals a little smaller, the two outer somewhat larger; filaments very many, yellowish, with broadish compressed striated antheræ. Germ roundish, greenish, with eight rays on the top. Capsule roundish oblong; seeds black when ripe. The flower has a fine sweet smell like the jonquil, especially morning and evening. The seeds were sent from the eastern confines of the Russian empire, from the province of Argunsky in Siberia, in latitude 51°, by Heidenreich, and were sent to the Eltham-garden, with those of several other plants, by J. H. de Sprekelsen. It was therefore cultivated there in 1730. The flowers appear from June to August. See the annexed Plate, fig. 1.

II. With smooth Capsules.

5. *Papaver rhœas*, corn or red poppy: capsules urn-shaped, smooth; stem hairy, many-flowered; leaves pinnatifid, gashed. Stem from one to two feet high, upright, round, branched, purplish at bottom, with spreading hairs

hairs bulbous at the base. Leaves sessile, forming a kind of sheath at bottom, hairy on both sides; the segments or leaflets unequally toothed or serrate, each tooth rolled back at the edge, callous at top, and terminated by a small spine. Peduncles long, round, upright, one-flowered, the hairs on it spreading horizontally; the petals bright full scarlet; stigma convex, with ten or twelve rays, of a purple colour; the capsule not globular, as Linnæus terms it, but shaped like an egg with the broad end cut off, (or, as Dr. Withering has it, urn-shaped, and nearly as broad as long,) marked with as many raised lines as there are rays to the stigma; which is flat and scalloped on the edge. Seeds dark purple. The petals give out a fine colour when infused; and a syrup prepared from this infusion is kept in the shops, more for the sake of the colour than of any active principle the flowers possess. The species partakes in a small degree of the same properties with *P. somniferum*. The capsules, as in that, contain a milky juice, of a narcotic quality, but the quantity is very inconsiderable. An extract from them has been successfully employed as a sedative; and some foreign practitioners even prefer this extract to opium. Native of every part of Europe, the Levant, Japan, &c. and much the most common with us of any of the species, in corn-fields; also on dry banks and on walls; in such situations varying in its foliage, but still retaining the urn-shaped capsule, and spreading hairs. It flowers from June to August. Being so common a weed, it has many provincial names in English, besides its more classical ones of corn-poppy, and red or scarlet poppy; such as corn-rose, cop-rose or cup-rose in Yorkshire, canker or canker-rose or red-weed in the eastern counties, head-wark, &c.

β. There is a variety with an oval black shining spot at the base of each petal, from which many beautiful garden varieties originate. These have double flowers, white, red bordered with white, and variegated.

6. *Papaver dubium*, or long smooth-headed poppy: capsules oblong, smooth; stem many-flowered, with bristles pressed close; leaves doubly pinnatifid. This species resembles the preceding so much, as often to be mistaken for it. But the capsules of this are long and slender; the hairs on the peduncle are finer, and pressed upwards close to it; on the young peduncles they assume a shining silvery-white appearance, which is very beautiful; on the other parts of the plant the hairs spread out; the stalks and leaves are much paler; the flowers much smaller, and less intensely red. Dr. Withering also remarks, that a strict attention to the proportionate length and breadth of the capsule, and to the hairs of the peduncle being laid close or spreading, will always distinguish this species from *P. rhæas*. According to him, the segments of the leaves are entire, the edges and midribs hairy; rays of the stigma from six to ten. It is a native of several parts of Europe. According to Mr. Lightfoot, it is the most common species in North Britain; and in Battersea-field, says Mr. Curtis, where the soil is light, it is nearly as common as the *rhæas*; nor is it unfrequent on walls. About Cambridge, Oxford, Stockwell in Surry, Bocking in Essex, &c. This, as well as the preceding, is annual.

β. Dr. Withering mentions a variety, with the whole plant very hairy, figured in *Flora Danica*, 902. It seems, he says to be an intermediate plant between *rhæas* and *dubium*, if it be not a distinct species. The bristles on the peduncles are laid close, as in the latter; but the segments of the leaves are very much snipt at the edges. The calyx is studded with large transparent globules, and a taper bristle springs out of each. The capsule is nearly twice as long as it is broad, so that it is longer than in *P. rhæas*, but shorter than in *P. dubium*. It is found about Shanklin Chine, and in pastures in various parts of the Isle of Wight. The stem is about two feet high.

7. *Papaver somniferum*, common officinal or garden poppy: calyxes and capsules smooth; leaves embracing, galled. Of this species there are two principal varieties, the white and the black.

α. The common white poppy has the stalks large, smooth, five or six feet high, branching. Leaves large, greyish, embracing at the base, irregularly jagged on their sides. Flowers terminating; whilst inclosed in the calyx hanging down, but before the corolla expands becoming erect: the calyx is composed of two large oval greyish leaves, that separate and soon dry off: the corolla is composed of four large roundish white petals, of short duration; and succeeded by large roundish heads as big as oranges, flattened at top and bottom, and having an indented crown or stigma. *Seeds white*. There are several varieties, differing in the colour and multiplicity of their petals, which are preserved in gardens for ornament; but that with single flowers only is cultivated for use.

β. The common black poppy has stalks about three feet high, smooth, and dividing into several branches. Leaves large, smooth, deeply cut or jagged on their edges, and embracing. Petals purple with dark bottoms; succeeded by oval smooth capsules filled with *black seeds*, which are sold under the name of maw-feed. There are many varieties of this with large double flowers, variegated of several colours; red and white, purple and white, and some finely spotted like carnations: there are few plants whose flowers are so handsome; but, having an offensive scent, and being of short duration, they are not much regarded. They are both annual, and flower in June.

Linnæus remarks the smoothness of all the parts in this species; the stem, leaves, calyx, and capsule. The rays of the stigma are ten, or thereabouts, and the half internal divisions as many. The officinal poppy is a native of the southern parts of Europe; but probably came originally from Asia, where it is cultivated in great quantities.

The general history of opium and its virtues has been so judiciously detailed by Dr. Woodville, in his *Medical Botany*, that we shall here insert the most material part of that author's information.

Opium, called also *Opium Thebaicum*, from being anciently prepared chiefly at Thebes, has been a celebrated medicine from the remotest times. It differs from meconium, which was made by the ancients of the expressed juice or decoction of the poppies. It is imported into Europe in flat cakes, covered with leaves to prevent their sticking together: it has a reddish-brown colour, and a strong peculiar smell: its taste, at first, is nauseous and bitter, but soon becomes acrid, and produces a slight warmth in the mouth: a watery tincture of it forms an ink, with a chalybeate solution. According to the experiments of Alston, it appears to consist of about five parts in twelve of gummy matter, four of resinous matter, and three of earthy or other indissoluble impurities.

The use of this celebrated medicine, though not known to Hippocrates, can be clearly traced back to Diogenes, who was nearly his contemporary; and its importance has ever since been gradually advanced. Its extensive practical utility however has not long been well understood; and in this country perhaps may be dated from the time of Sydenham. Opium is the chief narcotic now employed: it acts directly upon the nervous power; diminishing the sensibility, irritability, and mobility, of the system; suspending, according to the idea of a late ingenious author, the motion of the nervous fluid to and from the brain, and thereby inducing sleep, one of its principal effects. From this sedative power of opium, by which it allays pain, inordinate action, and restlessness, it naturally follows, that it may be employed with great advantage in a variety of diseases. Indeed there is scarcely any disorder in which, under some circumstances, its use is not found proper; and, though in many cases it fails to procure sleep, yet, if taken in a full dose, it occasions a pleasant tranquillity of mind, and a drowsiness, approaching to sleep, which always refreshes the patient. But, besides the sedative power, it is also known to act more or less as a stimulant, exciting the motion of the blood;

blood; and this increased action has been ascribed ingeniously, and, as we think, rationally, to that general law of the animal economy, by which any noxious influence is resisted by a consequent re-action of the system. By a certain conjoined effort of this sedative and stimulant effect, opium has been thought to produce intoxication, a quality for which it is much used in the eastern countries.

In most of the continued fevers of this climate, though originating from contagion, or from whatever cause, there is generally at the beginning, more or less of inflammatory diathesis; and this, while it continues, would forbid the use of opium, which might prove dangerous. Its use is also forbidden in the more advanced state of this fever, whenever topical inflammation of the brain is ascertained, which sometimes exists, and produces delirium, though other symptoms of the nervous and putrid kind prevail. But when irritation of the brain is not of the inflammatory kind, and debility has made much progress, or where delirium is accompanied with spasmodic affections, opium is a sovereign remedy, and may be employed in large doses every eight hours, unless a remission of the symptoms and sleep take place. In intermittent fevers, opium, in combination with other medicines, was much used by the ancients; but, since the introduction of Peruvian bark, it is seldom trusted to for the cure of these disorders: it has, however, been strongly recommended as an effectual means of stopping the recurrence of the febrile paroxysms; and has been given before the fit, in the cold stage, in the hot stage, and during the interval, with the best effects, producing immediate relief, and in a short time curing the patient, without leaving those abdominal obstructions which have been ascribed to the bark; but in these fevers, the best practice seems to be that of uniting opium with the bark, which enables the stomach to bear the latter in larger doses, and adds considerably to its efficacy.

When opium is so managed as to produce sweat, it will tend to remove an inflammatory state of the system, and may prove generally useful: a notable instance of this we observe in the cure of acute rheumatism by means of Dover's powder. In the small-pox, opium, since the time of Sydenham, has been very generally and successfully prescribed, especially after the fifth day of the disease; but during the first stage of the eruptive fever we are told that it always does harm; an opinion (says Dr. Woodville) which our experience at the Small-Pox Hospital warrants us to contradict. In hæmorrhages, the use of opium is inferred from its known effects in restraining all excretions except that of sweat; but, unless the hæmorrhages be of the passive kind, or unattended with inflammation, it may produce considerable mischief. In dysentery, opium may be occasionally employed to moderate the violence of the symptoms. In diarrhæa, when the acrimony has been carried off by a continuance of the disease, it is a certain and efficacious remedy. In cholera it is employed with laxatives, and no doubt often prevents inflammation by removing the spasm.

Opium has lately been commended in venereal cases; and instances have been adduced in which it has succeeded where mercury had failed: but few practitioners, we apprehend, will trust to opium alone in these complaints. Opium is successfully used in tetanus, and in other spasmodic and convulsive cases.

Respecting the external use of opium, authors are not agreed: some contending, that when applied to the skin it allays pain and spasm, and procures sleep, while others affirm, that when thus applied it has no effect whatsoever. Applied to the naked nerves of animals, it produces torpor, and loss of power in all the muscles with which the nerves communicate. Opium taken in an immoderate dose, proves a narcotic poison, producing vertigo, tremors, convulsions, deliriums, stupor, stertor, and finally fatal apoplexy.

The official preparations of this drug are, Opium puri-
Vol. XVIII. No. 1248.

ficatum, pilula ex opio, pulvis opiat, tinctura opii, and tinctura opii camphorata. It also enters into the pulvis sudorificus, balsamum anodynum, electuarium japonicum, pulvis e creta composita, &c. The requisite dose of opium varies in different persons, as well as in different states of the same person. A quarter of a grain in one adult, will produce effects which ten times the quantity will not do in another; and a dose that might prove fatal in cholera or cholera, would not be perceptible in many cases of mania or tetanus. The lowest fatal dose, to those unaccustomed to it, seems to be about four grains; but a dangerous dose is so apt to occasion vomiting, that it has seldom time to occasion death. When given in too small a dose, it often produces disturbed sleep, and other unpleasant consequences; and, on the other hand, a small dose will sometimes produce sound sleep, and alleviation of symptoms, when a larger one would not have succeeded. Its general operation is supposed to last about eight hours. It is well known, that, by continued habit, opium may be taken in large quantities; and we are told by Garcias ab Horto, an instance in which it was increased to ten drams a day. About twenty drops of the tinctura thebaica, or laudanum, are considered as nearly equivalent to a grain of opium. Those who are addicted to the use of opium in the east will sometimes take incredible quantities.

The white poppy, *a*, is commonly considered as the officinal plant; but any of the varieties may be employed indiscriminately, since no difference is discovered in their sensible qualities or effects. The heads or capsules are also powerfully narcotic or anodyne; boiled in water, they impart their narcotic juice. The liquor strongly pressed out, suffered to settle, clarified with whites of eggs, and evaporated to a due consistence, yields an extract, possessing the virtues of opium, but requiring to be given in double the dose. It is said not to occasion a nausea and giddiness, which are the usual effects of opium. It is convenient to prepare the syrup from this extract, by dissolving one dram in two pounds and a half of simple syrup. The *syrupus papaveris albi*, as directed by both colleges, is an useful anodyne, and often succeeds in procuring sleep, where opium fails; it is more especially adapted to children. White-poppy heads are also used externally in fomentations, either alone, or more frequently added to the *decoctum pro fomento*. The seeds possess not any narcotic power: they consist of a simple farinaceous matter, united with a bland oil, and in some countries are eaten as food. As a medicine, they have been given in the form of emulsion, in catarrhs, stranguries, &c.

Opium is imported into Europe from Persia, Arabia, and other warm regions of Asia. Six hundred thousand pounds of it are said to be annually exported from the Ganges. The manner in which this drug is collected in the east has been described long ago by Kæmpfer and others; but the most circumstantial detail of it is given by Mr. Kerr, in the fifth volume of Medical Observations and Inquiries. When the capsules are half grown, at sun-set, they make two longitudinal double incisions, passing from below upwards, and taking care not to penetrate the internal cavity. In Persia, according to Kæmpfer a five-pointed knife is used for this purpose. The incisions are repeated every evening, until each capsule has received six or eight wounds: they are then allowed to ripen their seeds. If the wound were to be made in the heat of the day, a cicatrix would be too soon formed. The night-dews favour the exsillation of the juice. Early in the morning, old women, boys, and girls, collect the juice, by scraping it off with a small iron scoop, and deposit the whole in an earthen pot, where it is worked by the hand in the open sunshine, until it becomes of a considerable thickness. It is then formed into cakes of a globular shape, and about four pounds in weight, and laid into little earthen basins to be farther dried. These cakes are then covered with poppy or tobacco leaves,
4 X and

and thus dried until they are fit for sale. It is then packed in chests, with fragments of the capsules from which poppy-seeds have been thrashed-out. This preparation, though simple, requires expert workmen able to detect the many adulterations which are practised on the raw juice. The adulteration of prepared opium is yet more difficult to discover. It has been supposed to be commonly vitiated with an extract from the leaves and stalk of the poppy, and with gum of the mimosa; other foreign admixtures have been conjectured, such as cowdung, gums and resins of various sorts, and parched rice.

Amid the extensive concerns of the British East-India Company, it is well known that the growth and manufacture of opium has for many years been considered as a great source of public revenue and of private wealth: whole districts have for these purposes been devoted to the culture of the poppy; the superintendence and collection of the taxes have been the employment of officers of high rank in the company's service; and the privilege of the commodity for a season one of the most lucrative gifts which the governors of the east could bestow on their nearest connexions. China was the grand mart for this article; and so strong was the attachment of the Chinese to its use, that any quantity sent to Canton was sure to be purchased at a high price. It appears, however, that this valuable traffic will now be lost to the company, the Chinese government having discovered that great evils result from the abuse of opium, the particulars of which have been detailed in instructions from the fooyuen to the hoppo at Canton, who has, in consequence, issued an edict, which, after recapitulating the fooyuen's instructions, wholly prohibits the importation of opium into the Chinese dominions; and the prohibition has been renewed during the present year, 1820.

The opium-trade, such as it is, it is well known has been monopolised by the company. It is provided in the provinces of Bahar and Benares; and sold in Calcutta by public sale. A learned and very ingenious inquirer estimated the produce of one acre at sixty pounds of opium; but we think he must have been misled by the result of trials on very fertile land in a fortunate season. Such information as we have been able to obtain, has led us to estimate little more than four *seers*, or eight pounds. Many cultivators obtain from the same land a crop of pot-herbs, or some other early produce, before the season of sowing the poppy; but it is reckoned a bad practice. In estimating the medium produce, we may advert to the accidents of season, to which this delicate plant is particularly liable from insects, wind, hail, or unseasonable rain. The produce seldom squares with the true average, but commonly runs in extremes: while one cultivator is disappointed, another reaps immense gain: one season does not pay the labour of the culture; another, peculiarly fortunate, enriches all the cultivators. *Remarks on the Husbandry of Bengal*; printed at Calcutta, 1804.

The poppy is cultivated in the Netherlands, and in the northern departments of France, on a large scale, not with a view to any soporific or narcotic qualities which the plant may contain, but on account of the sweet and pleasant oil which abounds in the seed. The poppy was first introduced into France from Germany about the year 1808, in consequence of the injuries, amounting almost to a general destruction, received by the olive-trees in the southern provinces from the severity of the preceding winter. The first planters having been amply recompensed for their expenses and labour by the price at which the poppy-oil was sold, others were induced to follow their example; inasmuch that, next to wheat, the poppy in certain extensive districts is the most general article of agricultural pursuit. The flavour of this oil is so sweet and delicate, that it is frequently substituted for that of the olive; and we have been credibly informed that the nature, qualities, taste, and flavour, of these two oils are so similar, and so much resemble each other, that this substitution is scarcely considered to be fraud in com-

merce. It is extracted by iron cylinders, which crush the seed, and which are put into action by small windmills, of which, in the immediate vicinity of Lille only, there are more than two hundred. The pulp, or residuum, is made into oil-cake for the fattening of cattle, which is for that purpose of a very superior quality; and the haulme, which is more substantial than straw, is used by the bakers for heating their ovens. The capsule is sometimes fold to the chemists; and from them a decoction is made similar to what is too frequently manufactured by the cottagers of this country under the name of *sleeping-water*.

That it is so cultivated we have the testimony of Miss Hatfield, who, in her "Terra Incognita of Lincolnshire, 1815," has this passage: "Through the whole of this excursion I was particularly attracted by the almost general cultivation of the white poppy, with which every cottage-garden is adorned. Anxious to know the motive for an appearance so remarkable, on inquiring I was not a little surprised to find that this stately flower was raised for the purpose of distillation; that the villagers had frequent recourse to its lethean juices, as an inducer to stupefaction, the worst species of intoxication. That the suffering patient, sleepless and agonized with pain, should fly to the use of opiates; that the Turk, to whom wine is religiously prohibited, should seek a temporary gratification in the delirium they produce; does not surprise us; but that the simple healthy peasantry of Lincolnshire, who suffer no prohibitions, who live in greater plenty than those of any other county in the kingdom, should seek this deleterious enjoyment, greatly surprised me."

8. *Papaver pilosum*, or hairy red poppy: capsules smooth; stem many-flowered, clothed with spreading hairs; leaves clasping the stem, cut, hairy all over. Gathered by Dr. J. Sibthorp, about the Bithynian Olympus. The root of this new and handsome species appears to be perennial. Herb about the size of the last, but of a bright-green, not glaucous, and clothed with bristly hoary hairs, which spread horizontally on the stem, where they are very abundant, as well as on the flower-stalks, where they are sparingly scattered. The leaves are simple, broad, heart-shaped, with strong ribs and veins; the radical ones narrower, oblong, and stalked. Flowers about the size of the last, drooping in the bud, then erect; petals of a pale tawny scarlet, or full orange, with white claws; anthers yellow. This is a new species, described by Dr. Smith in his *Prodr. Græc. Sibth.* vol. i. p. 360.

9. *Papaver orientale*, or great oriental poppy: capsules smooth; stem single-flowered, leafy, rough, with close-pressed bristles; leaves pinnate, serrated, bristly. Native of the Levant. Tournefort found it near Erzerum, in Armenia, flowering in June. He introduced it into the gardens of Holland and France; and it has been, for about a century, a hardy perennial in our parterres, flowering early in summer, and very conspicuous for the great size, and peculiarly-brilliant scarlet colour, of its flowers, which are too dazzling to be looked on in the sunshine: they are nearly a span wide, with dark stamens, and sometimes a black spot on each petal; germen globose, quite smooth and even, without ribs; rays of the stigma sixteen, peculiarly dilated. The root creeps moderately, by which the plant is increased, for it scarcely ever ripens seed with us. Stems about two feet high, simple, leafy, round, densely clothed with erect, rigid, pungent, close-pressed bristles. Leaves most numerous from the root, a foot long, dark-green, harsh and bristly, pinnate, with serrated decurrent segments. The juice of the plant is hot and acrid, yet Tournefort says the Turks and Armenians eat the unripe heads by way of luxury. They extract no opium from this species; but perhaps the similarity of its flavour and effects, to that great soothe of their cares, may cause it to be thus employed. The flower of this species is one of those that emit electrical sparks, or flashes of light. See the article *LIGHT*, vol. xii. p. 680.

This

This magnificent plant is exhibited on the annexed Plate, at fig. 2.

10. *Papaver virgatum*, or wand-like oriental poppy: capsules smooth; stem straight, paniced, many-flowered, rough with spreading bristles; leaves pinnate, cut, bristly. Native of Armenia. The stem is straight and stiff, paniced, bearing a great number of flowers, and clothed with spreading rigid bristles. Radical leaves numerous, pinnate, cut, hispid, especially their ribs, all the points callous, and tipped with a bristle, as in those of the preceding, which they in all respects much resemble. Flower-stalks scattered, each bearing one, two, or three, flowers; petals red; germen roundish, smooth. This species differs from the preceding, in having a straight paniced many-flowered stem, the bristles covering which are horizontal, not close-pressed.

11. *Papaver fugax*, or small fugacious poppy: capsules smooth, orbicular; stem paniced, many-flowered, smooth; petals minute; leaves pinnatifid, serrated, hispid. Brought by Michaux from Persia. It flowered in May 1789, in the royal garden at Paris. Poiret described it from Lamarck's Herbarium. He says it is distinguished by the stem, forming at the summit an ample panicle of many very small flowers, which last but a few hours. Each stem is slender, straight, striated, smooth, about eighteen inches high, simple, except at the top. Leaves scattered, stalked, not unlike those of *P. orientale*, but less deeply pinnatifid, not pinnate, furnished with a few long scattered hairs, the segments or teeth, more or less distant, each terminated by a long bristle. Petals pale-red, very small in comparison with the rest of the genus, and extremely fugacious.

12. *Papava Cambricum*, or yellow Welsh poppy: capsules smooth, oblong, beaked; stem nearly smooth, bearing several flowers; leaves pinnate, cut. This species, one of the most elegant of our native plants, seems peculiar to rocky shady situations in Wales and Westmoreland; for the reference to Bauhin's *Prodromus*, on which Linnaeus grounds his assertion of its being found on the Pyrenees, appears to belong either to the alpinum or nudicaule. It is perennial, flowering in June; and may be cultivated in the moist shady parts of a garden, where, though each root does not, in general, last many years, the seeds, scattering themselves in the undisturbed soil, will from time to time produce new plants. The stem is twelve or eighteen inches high, leafy, somewhat branched, clothed with a few rather upright hairs. Leaves tender and delicate, of a pale but pleasant green, pinnate, their common-stalk winged; their leaflets ovate, acute, cut or lobed, almost entirely smooth, glaucous underneath, each above an inch long. Flowers terminating the few branches, solitary, on long stalks, about the size of *P. dubium*, but of a beautiful lemon-colour, with a scent like those of *Crasula coccinea*, or *Mesembryanthemum noctiflorum*. The herb when wounded discharges a yellowish fluid, not unlike the juice of the common celandine, to which indeed this plant is so nearly allied in botanical affinity, that such a coincidence is not surprising.

It was first described and figured by Parkinson in 1640. He says that it grows in many places of Wales, in the valleys and fields, at the foot of the hills, and by the water-sides; about a mile from Abbar, and in the midway from Denbigh to Guider, the house of sir John Guin (Wynne), as also near a wooden bridge over the Dee to Balam in North Wales, and in going up the hill that leads to Bangor; as also near Anglesea. On the back of Snowdon, going from Caernarvon to Llanberris; as you ascend the Glyder from Llanberris, &c. commonly by rivulets or on moist rocks; also beyond Pont Vawr. Found by Dillenius on Cheddar rocks in Somersetshire; and since about Kendal, Kirby-Lonsdale, and Winander Mere, in Westmoreland, and Hooker in Lancashire, by Mr. Woodward and others.

Propagation and Culture. All the sorts of poppy are propagated by seeds; but those which have perennial roots

may be also propagated by offsets. The best time for sowing the seeds is in September, when they will more certainly grow, and those sorts which are annual will make larger plants, and flower better, than when they are sown in the spring. The best way is to sow the seeds of the annual kinds in the places where they are to remain, and to thin the plants where they are too close; those of the large kinds should not be left nearer to each other than a foot and a half, and the smaller sorts may be allowed about half that space. The culture they will require after this, is only to keep them clean from weeds. Those who are curious to have fine poppies in their gardens, carefully look over their plants when they begin to flower, and cut up all those plants whose flowers are not very double and well marked, before they open their flowers, to prevent their farina mixing with their finer flowers, which would degenerate them; and it is the not being careful of this, that causes the flowers to degenerate so frequently in many places, which is often supposed to be occasioned by the ground.

5. The quantity of scarlet poppy, canker, or redweed, in some lands, is a disgrace to the farmer; and the brilliancy of the flowers proclaims his disgrace to the whole country. Being an annual weed, it is easily destroyed by good husbandry; but, like other oily seeds, it will lie long in the ground without corrupting. It is said to have vegetated after having been twenty-four years buried. Swine are frequently turned upon it in Norfolk; and they will eat out this troublesome weed, with little or no damage to the wheat. Others feed first with sheep, then with cattle till April, taking them off when it rains much, if the land is not very light. Upon dry soils, which are most subject to poppy, Mr. Ellman, of Shoreham, ploughs his tare and rape land for wheat the beginning or middle of September, in order to sow the middle of October; the harrowing kills the poppy; and, in putting in the seed, he likes to tread much with oxen or sheep. A neighbour treads his with oxen in March, which he thinks better against the poppy than doing it at sowing. This treading may destroy the present crop of poppy; but the hoard of seed remains in the ground to come up on every ploughing. The only way to destroy such weeds effectually, is to make them germinate, by bringing them near the surface, and then to cut and tear them with the plough, the skim, the scuffler, or the harrow, according to circumstances.

7. The culture of the common white poppy, as practised in the province of Bahar, is as follows. The field being well prepared by the plough and harrow, and reduced to an exact level surface, it is then divided into quadrangular areas, seven feet in length, and five in breadth, leaving two feet of interval, which is raised five or six inches, and hollowed out for conveying water to every area, for which purpose they have a well in every cultivated field. The seeds are sown in October or November. The plants are allowed to grow six or eight inches distant from each other, and are plentifully supplied with water. When the young plants are six or eight inches high, they are watered more sparingly; but a compost of ashes, human excrement, cow-dung, and a portion of nitrous earth scraped from the highways and old mud-walls, is strewed all over the beds. When the plants are near flowering, they are watered profusely to increase the juice. The capsules being half grown, and fit to collect opium from, the plants are no longer watered.

It appears that the poppy may be cultivated for the purpose of obtaining opium to advantage in Great Britain. Professor Alston, of Edinburgh, said, long since, that the milky juice, drawn by incision from poppy-heads, and thickened either in the sun or shade, even in this country, has also the characters of good opium; its colour, consistence, taste, smell, &c. are all the same; only, if carefully collected, it is more pure and free from feculencies. Similar remarks have been made by others; "to which," says Dr. Woodville, "we may add our own; for, during that

that summer, (probably 1792,) we at different times made incisions in the green capsules of the white poppy, and collected the juice, which soon acquired a due consistence, and was found, both by its sensible qualities and effects, to be very pure opium. May I be permitted to add, that near fifty years ago, I frequently amused myself with flashing the green poppy-heads, and collecting a most pure and well-digested opium from them."

But the merit of first cultivating the poppy for opium is due to Mr. John Ball, of Williton, who in the year 1798 was rewarded by the Society of Arts, Manufactures, and Commerce, with fifty guineas, for procuring opium in an unsophisticated state from British poppies, and communicating his mode of preparing it to the Society, for the use of the public.

When the leaves die away and drop off, the capsules or heads being then in a green state, is the proper time for extracting the opium, by making four or five small longitudinal incisions with a sharp-pointed knife, about an inch long, on one side only of the head, taking care not to cut to the seeds: immediately on the incision being made, a milky fluid will issue out, which, being of a glutinous nature, will adhere to the bottom of the incision; but some are so luxuriant, that it will drop from the head. The next day, if the weather should be fine, the opium will be of a greyish substance, and some almost turning black; it is then to be scraped off, with the edge of a knife, into pans or pots; and in a day or two it will be of a proper consistence to make into a mass, and to be potted. As soon as the opium is all taken away from one side, make incisions on the opposite side, and proceed in the same manner. The reason of not making the incisions all round at once is, that the opium cannot so conveniently be taken away; but every person, upon trial, will be the best judge. Children may with ease be soon taught to make the incisions, and take off the opium; so that the expense will be trifling. An instrument might be made, of a concave form, with four or five pointed lancets, about the twelfth or fourteenth part of an inch, to make the incisions at once.

Mr. Ball calculates, that supposing one poppy to grow in one square foot of earth, and to produce only one grain of opium, more than 50lb. will be collected from one statute acre: but, since one poppy produces from three or four to ten heads, in each of which from six to ten incisions may be made, each incision sometimes producing two or three grains; what must be the produce? and what the profit at the present price of opium, 22s. the pound?

"I am sensible (says Dr. Woodville) that great abatements must be made in practice from such theoretical calculations as these; and that in our moist climate many seasons will occur, and many days in almost every summer, unfavourable to the collection of the opium. It is however, with all its disadvantages, a very important object to cultivate the poppy for this purpose in Britain; considering the great price of foreign opium, the increasing call for it in medicine, the adulteration of what is imported by rice, flour, and other articles, and the employment that it will find in the collection for women and children."

Mr. Ball adds, that in 1795, from a bed of self-sown poppies 576 feet square, he collected four ounces of opium, though the plants were very thick: and from a few plants that stood detached he took from fifteen to thirty-four grains: this ground had been well manured with rotten dung. He remarks that the semi-double flowers, and those of a dark colour, produced the most opium; that the heads should be about the size of a walnut before the incisions are made; and that the foreign dried poppy-heads are full three times as big as ours. Mr. Miller remarks also that they are of a different shape; but the size is only owing to climate, and the shape indicates no more than a variety.

Mr. Ball advises the seed of *Papaver somniferum*,

official or garden poppy, to be sown at the end of February, and again the second week in March, in beds three feet and a half wide, well prepared with good-rotten dung, and often turned or ploughed, in order to mix it well, and have it fine, either in small drills, three in each bed, or broadcast; in both cases, thinning out the plants to the distance of a foot from each other, when about two inches high: keep them free from weeds, and they will grow well, produce from four to ten heads, and show large flowers of different colours. With an instrument something like a rake, but with three teeth, the drills may be made at once. Poppies do not bear transplanting: out of four thousand which Mr. Ball transplanted, not one plant came to perfection.

The point of most importance, respecting the cultivation of the poppy for opium in Great Britain, is, whether its quality be equal to that of foreign opium. This has been fully ascertained; not only by a druggist in London having agreed with Mr. Ball to give him the same price, for what he should make in the year 1795, as the foreign drug should bear at that time; but by the testimony of several eminent medical gentlemen in London who tried it, in consequence of the request of the Society for the Encouragement of Arts. Dr. Latham observes, that in its sensible qualities it does not seem inferior to any; that it possesses the excellence of being perfectly clean, which must always be an advantage when given in a crude state; and that probably the purified extract of the foreign would not be superior to the English. Dr. Pearson also reports, that he found the English opium to be equally powerful, and to produce the same effects as the best foreign preparation of this drug. Mr. Wilson not only found the English drug equal in point of strength to the best extract from foreign opium; but far superior in flavour, which in the extract is much injured by the boiling, and free from the impurities which are so abundant in crude foreign opium. *Woodville's Med. Botany*, p. 505. *Transf. of the Soc. of Arts*, vol. xiv. 1796. p. 260-70.

Notwithstanding the satisfactory nature of the above communication, the Society of Arts still continued to offer premiums for an improved and more-extensive cultivation of opium in this country. In the year 1800, Mr. Jones, of Fish-street-hill, London, received a premium of fifty guineas, the opium produced by him having been considered as equal in quality to the best foreign opium. His account, including remarks on that of Mr. Ball just quoted, is as follows.

In the summer of 1794, I cultivated a considerable number of white poppies. A few of the heads or capsules having been broken off by the wind, I observed at the extremity of the stalks a substance in every respect resembling Turkey opium. This accidental circumstance bringing to my recollection its method of production, as related in the Encyclopædia and elsewhere, I wounded a considerable number of them with my penknife, and, in the course of the day, collected a small quantity, which appeared more pure than any I had ever seen. From this period I have never entirely lost sight of the object I am now to consider; but, on account of various avocations, and particularly my rhubarb-plantation, which, at this time, required all the attention I could well spare, [this gentleman received, this very year, a premium of thirty guineas for the cultivation of rhubarb,] it was not in my power to engage in an undertaking of such magnitude; and more especially on a scale so extensive as that which I had already resolved to adopt, under a persuasion that experiments, when more confined, are for the most part fallacious. As preparatory, however, I have not failed every year to repeat the operation, at once establishing its practicability, and availing myself of many advantages which can only be derived from observation and experience. The enclosed certificates will inform the Society that at length my plan has been carried into execution,

tion, but not with the degree of success that ought and might have been expected to attend so large and extensive an experiment.

Two years have passed in producing what I flatter myself the Society will consider deserving their premium, particularly if I am able to render the operation much more simple than may at first sight be supposed.

The claimant, I observed, is required to submit to the Society his particular method of cultivating the poppies. As the mode adopted in the present instance arose rather from necessity than choice, I must go back as far as the autumn of 1797, to show how it happened.

Five acres of ground and upwards, situated in the parish of Enfield, in the county of Middlesex, I appropriated to this experiment, at the period above mentioned; which, being ploughed several times previous to the following March, were then sown broad-cast; and, the weather proving favourable, the seed soon vegetated, and appearances were very promising. From the neglected state of the land, however, to which I was unfortunately a stranger, such a profusion of weeds sprang up among them, that, after many fruitless efforts at recovery, I was under the mortifying necessity of ploughing them all up together. This circumstance not taking place till the latter end of April, the season for sowing was elapsed; and, as to cropping my field with oats or barley, a measure very strongly recommended to me, I considered it as a deviation from my original purpose, and therefore, without paying any attention to it, gave the field a summer-fallowing, conceiving the poppies might be sown with equal and perhaps greater advantage in autumn.

Finding that the *broad-cast* method of sowing precluded the possibility of hoeing where the land is much infested with weeds, I now adopted a different mode, and *drilled* in the seed with a very simple yet efficient machine, which I purchased of Mr. Macdougall of Oxford-street; but, as the weather began to be very severe so early as November, and continued so with few intermissions, the succeeding March found me very little forwarder. Yet still I persevered, and once more resolved to drill the whole five acres; they came up extremely well, and, as I expected, accompanied with innumerable weeds; but these by well-timed application were eradicated, though not without considerable difficulty.

I now thought myself secure; for nothing could assume a better appearance till the beginning of May. Alas! I could not foresee the cold and remarkably dry weather that ensued, and prevailed, I believe, for six weeks successively. Hence the growth of some became stunted, and others were entirely destroyed; but happily some warm refreshing showers fell just time enough to rescue the remainder. From these I have procured upwards of twenty-one pounds of opium, five of which, in compliance with the Society's requisition, I have sent for their inspection and examination.

This recital ought on no account to intimidate others; for it is obvious that the former inconveniencies originated in my own ignorance, whilst the latter depended upon the causes that, in all probability, may never happen again.

Mr. Ball, in a letter published in one of the volumes of the Society's Transactions, advances an opinion which I consider as very fallacious, respecting the quality of land adapted to the growth of poppies. He seems to be very little concerned about this point, and hints the probability of their being cultivated almost every-where. I well know that poppies, like many other vegetables, will grow in soils of any description; but of this I am fully assured, that, like the rest, they have their particular and favourite soil, viz. a sandy loam, and that, the better this is, the more advantages will accrue to the cultivator. There is also another error in the same communication, which, having a tendency to mislead, ought to be pointed out. He tells us, to use his own words, "that, by a calculation he has made, supposing one poppy growing in one square

foot of earth, and producing only one grain of opium, more than fifty pounds (I suppose he means, of course, apothecaries' weight) will be collected from off one statute acre of land." Now, as there are no more than 43,560 square feet in an acre, and allowing one grain for each, the produce can be no more than ninety ounces and six drachms. This calculation appears to me to be as much in the extreme one way, as that of Mr. Ball is in the other. The medium is most probably nearest the truth; but upon this point I cannot at present speak with any degree of precision, on account of the scattered situation of my crop, and the extraordinary intemperance of the last season. Judging, however, from the number of heads we perceived, and comparing them with the total quantity, they seem to have yielded three-fourths of a grain each, upon an average, large and small.

I shall now lay before the Society some general remarks on the cultivation of poppies, and then conclude with submitting a few hints and directions respecting the preparation of opium.

Having a tap-root, their size will consequently be proportionate to the depth of earth they are enabled to penetrate. Hence the necessity of land that will admit of deep ploughing. The fineness of the surface, too, is very essential. As the seed is so small, and the plants, on their first coming up, so exceedingly tender, the bush-harrow should always be used after those which are commonly employed. By this means a greater number are likely to vegetate, and their roots, being better protected, are less liable to injury.

Poppies may be cultivated both by the drill and broad-cast mode of husbandry; at the same time it must be remembered, that the land for each requires a different disposition. In the former this is not so material, the sowing-machine regulating the distances of the rows according to the will of the operator; these ought to be nine inches or a foot asunder, and in beds containing four rows, allowing a foot and a half between each. But, with respect to the latter, this point must be strictly attended to; the ridges should never exceed four feet in breadth; so that the furrows will answer the double purpose of preserving the land throughout the winter, and, in the season for collecting the opium, serve as paths for the workmen.

Besides two chances of a crop, I am decidedly in favour of autumnal sowing; and the first week in September seems to be the most favourable period for this purpose. If the weather continues open, they will make such a progress as to be capable of resisting the severity of an inclement winter, without, on the other hand, being too forward; a circumstance highly dangerous, as the first severe frost is inevitably destructive. On this account, whether by the drill or otherwise, a large proportion of seed should be sown at this season, for the plants will defend each other; and, as all the plants will not be equally forward, so, let the winter prove as it may, provided the seed has vegetated freely, there will be great probability of a good appearance in spring.

I do not without sufficient reason recommend that this operation should be performed in autumn. The poppies are not only generally larger, but, even when this is not the case, I know, from experience, that they will yield a much larger proportion of opium; for it seldom happens that a spring-poppy will *bleed*, as we term it, more than twice, while the others will bear scarifying till they are nearly ripe. This, I imagine, can only arise from the length of time the one has been in the ground in comparison with the other. In drilling, the necessity of covering the seed by harrowing is suspended by the operation of the machine; and, in the broad-cast method, a shower of rain will have all the effect without further trouble or expense.

Excepting great additional care, turnip and poppy hoeing are similar, and in every respect may be conducted in the same manner. I believe the turnips are rather benefited, they certainly are not injured, by being shaken,

and will recover from the effects of a wound; but, if the poppies are accidentally touched, they will either exhaust themselves by bleeding, or dwindle so as to be of no value. But it is high time to proceed to the last point I proposed to consider; namely, the production and preparation of opium.

In ordinary seasons, the heads or capsules of the autumnal poppies will be large enough for our purpose in the month of June; for at this time they will have attained about half their growth, or be equal in size to a small tea-cup. I have invented a variety of instruments as scarificators; but, as only two kinds were actually used, I am unwilling to trouble the Society with a description of any other.

The first of these instruments consists of two thin steel blades fixed by a wedge in a wooden handle, so as to make incisions about one-fourth of an inch from each other. The other is made entirely of steel, and resembles in form the tuning-fork of a harpichord. It consists of four bars, proceeding from a handle of a convenient length, a quarter of an inch wide, and two and a half long, each terminating with a bolster, through which a screw passes that fixes the scarificators. The centre bars should be so elastic as to yield to the curvature of the capsule, upon the outer ones being pressed by the finger and thumb; and by this means four incisions are made at once, at equal distances. This instrument is an inch and three quarters in width; but from the two outer blades, only an inch and a quarter. The bolsters are a quarter of an inch in diameter, and the scarificators a proportionate length, namely, three-eighths. The wedge in the former, and a longitudinal aperture in the scarificators, or blades, of the latter, will regulate the depth of the incisions, at the will of the operator. It is of the utmost importance that these should not be made through the inner coat of the capsules.

Seven boys were employed, from eight to twelve years of age, together with a man as a superintendent. To the youngest I gave three-pence per day; and to the rest, if tractable and well-disposed, an additional penny for every additional year. The steel instrument was used by the latter, and the others by the former. I have great reason to be satisfied with their construction; for, notwithstanding their simplicity, they proved themselves fully equal to my purpose; and so considerable a trial has not suggested any other improvement, than that in the largest the two inner bars only should be elastic; for the continual pressure of the finger and thumb on the two outer ones, which is absolutely necessary for the others to act, would be avoided, and consequently much fatigue and inconvenience prevented. It is of very little consequence whether the first incisions are made horizontally or vertically with this instrument; for, however luxuriantly the milk may flow, by making four at one time, it so divides the stream, that seldom any escapes. With the smaller ones we most commonly made them horizontally, beginning as near the top of the head as possible, and for this reason—all the juices, if the first incision was made at the bottom, would be naturally attracted by the aperture, and render every other completely fruitless, besides occasioning the loss of a considerable quantity by falling on the surrounding leaves; whereas, on the other hand, a proportion of milk will exude from each, and the opium be equally distributed over the whole surface of the head. No particular directions seem necessary for repeating this operation, any farther than that each time it should be performed in a contrary direction, and continued, till no more will exude, at intervals of four or five days, or more, according to circumstances: for, as the weather proves rainy or fair, they will be shorter or longer, the heads being sooner replenished in the one than the other.

Each of the children being provided with a tin cup, having one handle, so contrived as to fix itself to a girdle fastened round his waist, with a common gardening-knife they scraped off the opium that appeared upon the heads

in a soft ash-coloured substance. Dewy mornings are best calculated for this purpose, and it should be discontinued as soon as the sun has gained a sufficient power to dissipate it; for, if persevered in throughout the day, some of the opium will recede into the interstices, and more, in defiance of every endeavour, will remain upon the heads. The principal quantity exudes in the course of the night, and, uniting with the dew, it is taken off as readily and completely as with a sponge.

The interval from breakfast-time to sunset, if the weather assumed a settled appearance, was occupied by scarifying. And, upon the whole, considering it was the first attempt of the kind, every thing proceeded very regularly; and, had the summer been propitious, notwithstanding my former disappointments, I should have had great cause for satisfaction. The largest quantity that my man, seven children, and myself, were able to procure in one morning, from five to nine o'clock, was one pound and a half: this happened when the dew was remarkably great, and succeeded one of the warmest days in the summer.

From the experience I have had, the precariousness of our climate appears to me the only obstacle to the production of opium in this kingdom. The evil produced by a sudden alteration of weather is irreparable; for, should it happen after a fine scarifying day, we not only lose the labour of that day, but all its produce. It becomes obviously necessary, therefore, to be particularly circumspect; the poppies will receive no damage from remaining entire; while, on the other hand, impatience may be injurious, if not destructive.

The opium, when first collected, from its union with the dew is much too soft to be so formed as the Society will receive it. To reduce it to a proper consistence, taking Nature for our guide, it should be thinly spread in shallow dishes, and exposed, under glasses, to the rays of the sun. My opinion is, that Turkey opium suffers considerably from the operation of fire; certain it is, that with respect to its effluvia, it undergoes a complete alteration. I have covered it with its own leaves, thinking this a very convenient mode of package, and conceiving it to be important, in every new undertaking, by studying appearances, to yield to the general prejudices which naturally prevail in favour of the article to which we have been accustomed.

The following testimony of the quality of the opium is extracted from a letter from Dr. Woodville to Mr. Jones. "I have examined the opium collected by you from the capsules of the white poppy; and I have no doubt, from its taste, smell, colour, and purity, but that it is more powerful and efficacious than the best foreign opium imported into this country. The late Dr. Alston, when professor of botany and materia medica in the university of Edinburgh, informed the public, more than sixty years ago, (see *Med. Essays*, vol. v.) that the milky juice, drawn by him from the heads of the white poppy, soon acquired the consistence of opium, when its taste, smell, faculties, &c. were the same as those of that drug. In the year 1791 I convinced myself of the truth of his assertion, by repeating his experiments, which I noticed the following year in my *Medical Botany*. Soon after this time I appropriated a part of the garden at the Small-Pox Hospital for the growth of the *Papaver somniferum*, from the green capsules of which were collected between two and three ounces of opium, which was found to be more efficacious than that of the exotic, as appeared upon trials of it made by several of my medical friends. But the great trouble and length of time required for the collection of the juice induced me at the time to think, that the manufacture of this valuable medicine in England did not hold forth any prospect of commercial advantage. However, since I have seen the great quantity of it collected under your direction, I sincerely hope that the above opinion will prove to be unfounded; and congratulate you on your success."

Other

Other letters accompany this account, from Dr. Pearson, Mr. John Horner, and Mr. G. E. Lawrence, which prove the quality to be equal to the best foreign opium. The committee of chemistry, to whose examination the English opium, prepared by Mr. Jones, was referred by the Society, ordered samples of it to be left with several eminent chemists for their analysis and judgment; in consequence of which, the following preparations were laid before the committee by those gentlemen, viz. Extract of English opium in proof spirit. Hard extract of English opium. Watery extract of English opium of the late Dispensatory. Tincture of English opium of the present Pharmacopœia. Tincture of English opium of the late Dispensatory, English opium powdered. Similar preparations of fine foreign opium were produced in comparison; and, from the general result of these experiments, it appears, that Mr. Jones's English opium is equal in quality to fine foreign opium; and the certainty of its growth in this country, preparation, and efficacy, fairly established. *Transf. of the Soc. of Arts*, vol. xviii.

PAPAVER CORNICULATUM and CORNUTUM.

See CHELIDONIUM and CLEONE.

PAPAVER SPUMEUM. See CUCUBALUS.

SPINOSUM. See ARGEMONE.

PAPAVEROUS, *adj.* [from *papaver*, Lat. a poppy.] Resembling poppies.—Mandrakes afford a *papaverous* and unpleasant odour, whether in the leaf or apple. *Brown's Vulg. Err.*

PAPAW', *f.* [*papaya*, low Lat.] A plant. See CARICA.

The fair *papaw*,

Now but a seed, preventing nature's law,

In half the circle of the hasty year,

Projects a shade, and lovely fruits does wear. *Waller.*

PAPAW-TREE of North America. See ANNONA.

PAPAW'S, a name given in the West Indies to the negroes of Whidah, or Fida, in Africa. For the particular manners of this tribe, see the article NEGRO, vol. xvi. p. 686. In addition to which, we have since been informed, that many of the Whidah negroes are found to be circumcised. Whether it be a religious ceremony common to all the tribes that go under the appellation of Papaws, has not been ascertained. It is practised universally by the Nagoes, a people that speak the Whidah language; but some negroes on this part of the coast disavow the practice.

PAPA'YA, *f.* An Indian name, retained by Tournefort, Plumier, and Jussieu, for the *Carica* of Linnæus, or papaw-tree. See CARICA.

PAPAZ'LI, a town of European Turkey, in Romania: twelve miles east-south-east of Filippopoli.

PAPE, *f.* [French.] The pope. *Coles.*—Any spiritual father; sometimes written *papa*. From the monasteries he receives a certain annual income or rent, according to the abilities and possessions thereof; and from every *papa*, or priest, a dollar yearly per head. *Ricaut's State of the Greek Church.*—The prayer of the *pape* so incensed the Scot, that he vowed revenge; and watched the *pape* with a good cudgel, next day, as he crossed the church-yard, where he beat him. *Carr's Trav. Guide*, 1695.

PAP'EBROCH (Daniel), a learned Flemish Jesuit, was a native of Antwerp, where he was born in the year 1628. When he was eighteen years of age, he com-

menced his noviciate among the Jesuits; and, after he had completed his studies, acquired no little reputation by the success with which, during fifteen years, he taught the belles-lettres, and after that time philosophy. From this employment he was taken to be associated with fathers Bollandus and Henschenius in the laborious work of compiling the "Acta Sanctorum;" and he accompanied the latter in his travels through Italy, France, and Germany, in order to collect materials for that voluminous undertaking. He published, jointly with Henschenius, the three volumes for the month of March, in 1668; three other volumes, for the month of April, in 1675; and the three first volumes for the month of May, in 1680. After this, Henschenius being disabled from proceeding with the design by a paralytic attack, the principal labour and conduct of it devolved upon Papebroch, who continued his labours on the same work till his death, in 1714, when he was in the eighty-seventh year of his age. The volumes of that work on which he was employed, amount to forty-seven in number, of a large folio size, and are considered to be the most correct and judicious in that vast compilation; as he had been careful to exclude many of the absurd legendary tales in the Martyrologies, Lives of the Saints, &c. from which they were compiled. Father Papebroch was also the author of, 2. *Conatus Chronico-historicus ad Catalogum Romanorum Pontificum*, 1685, folio. 3. *Acta Vitæ S. Ferdinandi Regis Castellæ et Legionis*, 1684, octavo. 4. A Latin version of a curious Spanish book, under the title of "Examen Divinitatis quam in Carmelo Vespasianus confulsit, five C. Suetonii Tranquilli Locus de Deo Carmelo Hispanice explicatus per Excellent. Dom. Gasparem de Mendoza," 1698, 4to. 5. A variety of treatises in controversy with the Carmelites, forming four volumes quarto, &c. *Gen. Biog.*

PAP'ELARD, *f.* A hypocrite. *Chaucer.*

PAPERLAR'DIE, or PAPELARDISE, *f.* Hypocrisy. *Cole.*

PAP'EMBERG, an island of Japan, in appearance a mountain, surrounded by the sea. Here the Dutch ships wait at anchor for a wind, when they wish to return to Batavia. The Japanese name is Takaboko, or Takajama.

PAP'ENBERG ISLANDS, five small islands in the Eastern Indian Sea. Lat. 6. 54. S. lon. 131. 58. E.

PA'PER, *f.* [*papier*, Fr. from *papyrus*, Lat.] Substance on which men write and print; made by macerating linen rags in water, and then grinding them to pulp and spreading them in thin sheets.—I have seen her unlock her closet, take forth *paper*. *Shakespeare.*—Piece of paper.—'Tis as impossible to draw regular characters on a trembling mind, as on a shaking *paper*. *Locke on Education.*—Single sheet printed, or written. It is used particularly of essays or journals, or any thing printed on a sheet.—Do the *papers* lie? *Swift.*

What see you in those *papers*, that you lose
So much complexion? look ye how they change!

Shakespeare.

It is used for deeds of security; or bills of reckoning.—He was so careless after bargains, that he never received script of *paper* of any to whom he lent, nor bond of any for performance of covenants. *Fell.*—They brought a *paper* to me to be sign'd. *Dryden.*

MANUFACTURE OF PAPER.

VARIOUS are the materials on which mankind, in different ages and countries, have contrived to write their sentiments; as on stones, bricks, the leaves of herbs and trees, and their rinds or barks; also on tables of wood, wax, and ivory; to which may be added plates of lead, linen rolls, &c. At length the Egyptian papyrus was invented; then parchment, then cotton paper; and, lastly, the common, or linen, paper.

In some places and ages they have even written on the skins of fishes; in others on the intestines of serpents; and in others on the back of tortoises. There are few sorts of plants but have at some time been used for paper for books: and hence the several terms, *biblos*, *codex*, *liber*, *folium*, *tabula*, *tiltura*, *philura*, *jcheda*, &c. which express the several parts on which they were written: and, though in Europe all these disappeared upon the introduction of the papyrus and parchment, yet in some other countries the use of divers of them obtains to this day. In Ceylon, for instance, they write on the leaves of the talipot; and the Bramin manuscripts in the Talinga language, sent to Oxford from Fort St. George, are written on leaves of the *ampaya*, or Palma Malabarica: Hermannus gives an account of a monstrous palm-tree called *coddia pana*, or Palma montana Malabarica, which, about the thirty-fifth year of its age, rises to be sixty or seventy feet high, with plicated leaves nearly round, twenty feet broad; with which they commonly cover their houses; and on which they also write, part of one leaf sufficing to make a moderate book. And Varro observes, that, from the circumstance of leaves having been first used for writing on, the same word began, and continued, to signify the leaf of a tree and the leaf of a book. See Phil. Trans. N^o 145, 246.

In the Maldivé islands, the natives are said to write on the leaves of a tree called *macaraguan*, which are a fathom and a half long, and about a foot broad. And in divers parts of the East Indies, the leaves of the Musa arbor, or plantain-tree, dried in the sun, served for the same use, till of late that the French have taught them the use of European paper. Ray also enumerates divers kinds of Indian and American trees which bear leaves proper to be used as paper; particularly one called *xagua*, which has something in it extraordinary; its leaves are so large, and of so close a texture, that they cover a man from top to toe, and shelter him from the rain, and other inclemencies of the weather, like a cloak; and from the innermost substance of these leaves, a paper is taken; being a white and fine membrane like the skin of an egg, as large as a skin of our vellum or parchment, and nothing inferior for beauty and goodness to the best of our papers. *Ray's Hist. Plantar.* tom. ii. lib. 32.

Paper is chiefly made among us of linen or hempen rags, beaten to a pulp in water, and moulded into square sheets of the thickness required. But it may also be made of nettles, hay, turnips, parsnips, colewort-leaves, asbestos, or any thing that is fibrous; nay, it may be made of white woollen rags; though this would not serve for writing, because of the hairiness. Other substances are—the pith of thistles, the bark of the fallow (*Salix caprea*), hemp, shaws of hemp, shaws of flax, hop-bines, stalks of cabbage, of mallow, of common broom, of the sun-flower (*Helianthus annuus*), of mugwort, of clematis, &c. the down of the cat's-tail, the catkins of the white poplar, the husks of maize, straw, &c. Trials of some of these, and especially of straw, have been made in England as far back as the year 1799; and in 1801, the Society of Arts gave a premium of twenty guineas to Mr. Thomas Willmott, of Shoreham, Sussex, for having made ten reams of paper from the *pau-plant* of Bengal, the *Corchorus olitorius* of

systematic writers. A specimen of the paper is placed in the volume (xix.) of their Transactions for that year: it is of a whity-brown colour, like tea-paper, and does not bear writing-ink well. Much, therefore, remains to be done; and, as the occasion is important, especially as it relates to commerce, and to the promulgation of arts and sciences, we should be happy to find, that some public-spirited individual, of enterprise and talent, would turn his attention to an extensive series of experiments, for the purpose of ascertaining the merits of these or other substitutes for linen rags, in the fabrication of paper for writing and printing. In the mean time, the Society of Arts continued, and we believe still continue, to offer premiums for the manufacture of paper from vegetable substances, particularly those which are the produce of Great Britain and Ireland. In the volume of their Transactions for the year 1812, it is observed, that, “the object of the Society being to add to the number and quantity of raw materials used in this manufacture, it is their wish to include every useful sort of paper, and to introduce such natural products as can be easily and cheaply procured in great quantities. The Society are in possession of two volumes containing a great variety of specimens of paper made from raw vegetable substances, viz. nettles, potatoe-haulm, poplar, hop-bines, &c. which volumes may be inspected by any person on application to the housekeeper.”

We shall divide the history of the manufacture of paper into seven sections; the last of which, however, is by far the most important. 1. Egyptian paper. 2. Paper made from cotton. 3. Paper from the interior bark of trees, or *liber*. 4. Chinese paper. 5. Japanese paper. 6. Paper made from asbestos. 7. Paper made from linen rags.

I. OF THE EGYPTIAN PAPER.

This is the famous paper used by the ancients, which was made of a kind of reed called *papyrus*, growing in Egypt on the banks of the Nile. According to Isidorus, this paper was first used at Memphis; and Lucan seems to be of the same opinion;

Nondum flamineas Memphis connexere biblos
Noverat. *Pharjal.* lib. iii.

Whatever truth may be in this, it is certain, that, of all the kinds of paper used by the ancients, the papyrus was the most convenient, both from its flexibility and from the ease of fabrication. It was a present from nature, and required neither care nor culture.

It is not certain at what particular period the ancients began to make paper of papyrus; but there are several authorities which prove the use of it in Egypt long before the time of Alexander the Great.

Pliny, lib. xiii. cap. 11. gives a full description of the method of making this paper in Egypt; which see abridged under CYPERUS papyrus, vol. v. p. 524.

There were paper-manufactories in divers cities of Egypt; but the greatest and most celebrated was that at Alexandria, where, according to Varro's account, paper was first made. It is certain, at least, it was from hence that Greece and Italy was furnished, on account of the convenient situation of that port; and it is more than probable it was this that gave the Romans occasion to conclude the art had been invented there. It was not till late, when Egypt was reduced into a Roman province, that they had much intercourse with, or even knowledge of, the inland cities of Egypt, where paper was also made. The trade and consumption of this commodity were in reality incredible. Vopiscus relates, that the tyrant Firmius, who rebelled in Egypt, publicly declared he would maintain an army only with paper and glue, “papyro & glutine.”

& glutine." This, Casaubon understands as spoken of the produce and revenue of paper; though Salmasius takes it to be meant of the papyrus itself, which could supply most of the necessaries of life.

We find divers species of Egyptian paper mentioned in ancient writers: some denominated from the places where they were manufactured; as, 1. The *Amphitheatrica*, supposed to have been made in some building belonging to an amphitheatre at Alexandria; though Guilandinus, with more probability, reads it *Arthritica*, from *Arthribus*, a city in the middle of the Delta, which was the place of its manufacture. What countenances this correction, is, that we find mention of this paper before there was so much as an amphitheatre at Rome, much less at Alexandria. 2. *Saitica*, made in the city Sais. 3. *Taniotica*, or, according to others, *Taitica*, whose place authors are not agreed on. There were also other sorts denominated from the makers; as, 4. The *Fanniana*, from the grammarian Fannius Palæmon, who kept a paper-work. This kind was small, but finer than the amphitheatrical paper; being first wrought at Alexandria, and afterwards finished at Rome. 5. *Claudia*, first made by order of the emperor Claudius. This was reputed the best of all, in that, besides the two pellicles, in common with the rest, it had a third. Others were denominated from the uses they were intended for; as, 6. *Hieratica*, the first or oldest sort, which was appropriated to religious uses; this was afterwards denominated *Augusta* and *Liviana*, in compliment to the emperor of that name, and his wife; who, according to some, improved and made it whiter than before. 7. *Emporetica*, or *Emporica*, a small and coarse sort, serving for shopkeepers' uses, to tie up goods, &c.

The qualities for which the ancient papers were prized, were their thinness, closeness, whiteness, and smoothness; though their breadth also considerably enhanced their value. That sort called *Charta Claudia* was thirteen inches wide; the *Hieratica*, eleven; the *Fanniana*, ten; and the *Amphitheatrica*, nine; as to the *Saitica*, it exceeded not the diameter of the mallet it was beaten with. Among these, the *Amphitheatrica* was highly esteemed for its strength, whiteness, and polish. The ink, however, sunk less in paper highly polished; and therefore the characters were more liable to be effaced. When it was not carefully soaked in the first preparation, the paper brought a less price; because letters were with difficulty formed upon it, and it sent forth a disagreeable smell. To remedy this defect, the paper went through a new course of sizing and hammering; and the size used on that occasion was made of light bread steeped in boiling water, and passed through a filtering-cloth. By this means the paper became in the highest degree united, and smoother than the finest linen. It was this paper which gave so long a duration to the works of the Gracchi, Tiberius, and Caius, in their own hand-writing. "I have seen them (says Pliny) in the library of Pomponius Secundus, a poet and citizen of the first rank, near 200 years after they were written." We may add, that manuscripts of this paper still remain, which have undoubtedly been written 1000 or 1200 years ago. Notwithstanding the care which was taken to give strength and consistency to the paper of Egypt, the leaves, although collected into a book, were too weak to support themselves; and for this reason it was a common practice, after every five leaves, to insert a leaf of parchment. There still remains in the abbey of St. Germain-des-Près a fragment of the Epistles of St. Augustine written in this manner. The manuscript is at least 1100 years old, and in a high state of preservation.

This paper was an important branch of commerce to the Egyptians, which continued to increase towards the end of the Roman republic, and became still more extensive in the reign of Augustus. The demand from foreign nations was often so great, as to occasion a scarcity at Rome; and we read in the reign of Tiberius of a tumult among the people in consequence of this scarcity. In a

letter of the emperor Adrian, the preparing of the papyrus is mentioned as one of the principal occupations at Alexandria. "In this rich and opulent city (says he) nobody is seen idle: some are employed in the manufactory of cloth, some in that of writing-paper," &c.

St. Jerome informs us, that it was as much in use in the fifth century when he flourished. The duty on the importation of this commodity had grown excessive towards the end of this or the beginning of the sixth century; and, being abolished by Theodoric king of Italy, Cassiodorus, in the 38th letter of his 11th book, congratulates the whole world on the discharge of an impost on a merchandise so essentially necessary to mankind.

Montfaucon and Mabillon mention several fragments written on this paper in the sixth century. One of them was a charter of the emperor Justinian, entitled, *Charta plenarie securitatis*. Father Montfaucon saw in 1698, in the library of Julio Justiniana, three or four fragments of paper of Egypt of the same antiquity. And Mabillon speaks of some books of the Jewish Antiquities by Josephus, translated into Latin, which seemed to have been written in the same century, and which were preserved in the library of St. Ambrose of Milan. The same father mentions to have seen in the library of St. Martin of Tours the remains of an old Greek manuscript of the paper of Egypt, and which appeared to him to be of the seventh century. He also believes, that the copy of St. Mark's Gospel preserved in the register-office of Venice is written on the same paper, that it is the most ancient of any of the evangelical manuscripts, and may be supposed to be written at the latest in the fourth century. According to the same antiquarian, the paper of Egypt was used in France, and Italy, and other European countries, both for books of learning and public records; and there still remains, adds he, a great number of these in the archives of the church at St. Dennis, at Corbie, in the abbey de Grasse, and in other convents.

It is probable, that the invention of paper made of cotton, of which we are next to treat, insensibly destroyed the reputation and manufacture of the paper of Egypt; but it is still a question at what particular period the fabrication of the latter totally ceased. Eustachius, the learned commentator on Homer, assures us, that in his time, in 1170, it was no longer in use; but father Mabillon maintains, that many of the popish bulls were written on the papyrus in the 11th century.

Count Maffei, in his *Istor. Diplomat. lib. ii. Biblioth. Ital. tom. ii.* is decidedly of opinion, that the paper of Egypt was not in use in the fifth century. He considers all records written on this paper dated posterior to this period as not authentic; and the popish bulls mentioned by Mabillon appear to this learned person, as well as the copy of St. Mark's Gospel, to be written on paper manufactured from cotton. To reconcile in some measure these contradictory accounts, it may be observed, that on some particular occasions, and by some particular persons, the paper of Egypt might have been employed for several hundred years after it ceased to be of general use. Whoever wishes for a fuller account of the paper of Egypt, may consult among the ancients Pliny, lib. xiii. and Theophrastus, lib. iv. chap. ix. and, among the moderns, Guilandinus, Scaliger, Salmasius, Kerchmayer, Nigrifoli; Hardouin, in his edition of Pliny; Mabillon, *De Re Diplomat.* Montfaucon in his *Paleography*, and in his *Collections*; the illustrious Maffei in his *Istor. Diplomat.* the Count de Caylus in the *Memoirs of the Academy of Inscriptions*; and Mr. Bruce in his *Travels to discover the Source of the Nile*.

II. OF PAPER MADE FROM COTTON.

It is generally supposed that the invention of the paper, called *Charta bombycina*, supplanted the Egyptian paper in Greece. This paper is incomparably more lasting, and better calculated for all the purposes of writing. It is not precisely known at what period this art, which

supposes a great variety of previous experiments, was first reduced to practice. The application of cotton to the purposes of paper-making requires as much labour and ingenuity as the use of linen rags; and for this reason, if we could determine the precise time when paper was made from cotton, we should also fix the invention of the art of paper-making as it is now practised in Europe. Father Montfaucon proves, by incontestable authorities, that paper from cotton was in use in 1100. This paper in the Greek language is called *χαρτι βυβλινος*, or *βυβλινος*; for although *βυβλινος* is the Greek word for silk, yet in those times it was applied, as well as *βαμβαξ*, to cotton; and hence the Italians to this day call cotton *bambaccio*.

The most ancient manuscript of this paper which father Montfaucon saw with the date, was that in the French king's library, written A.D. 1050; but as the manuscripts without date are infinitely more numerous than those which are dated, and as some conjecture can be formed concerning them from the manner of writing, this father believes some of them to have been written in the tenth century. The researches of the same learned antiquarian amount almost to a proof that this paper was discovered towards the end of the ninth century or beginning of the tenth; for before the twelfth century it was commonly used in the eastern empire, and even in Sicily. Roger king of Sicily says, in a diploma written in 1145, that he had renewed on parchment a charter which had been written on paper of cotton in the year 1100, and another which was dated in the year 1112. About the same time the empress Irene, in the statutes for some religious houses at Constantinople, says that she had left three copies of the same statutes, two in parchment and one in paper from cotton. From that period this paper was still more in use through all the Eastern empire; and innumerable Greek manuscripts are found written on it in all the great libraries.

This discovery happened at a time when there seems to have been a great scarcity of parchment; for it was about this period that the Greeks erased the writings of Polybius, Diodorus of Sicily, and many valuable ancient authors, for the sake of the parchment.

It was the invention of this paper of cotton which destroyed the manufacture of the paper of Egypt; for, if we may believe Eustathius, who wrote towards the end of the 12th century, the latter paper had gone into disuse but a little before his time. We may easily believe, however, that this new invention, although of great advantage to mankind, was introduced by degrees.

The manufacture of this kind of paper has flourished in the Levant for many ages, and is carried on with great success even to this day. It is not necessary to say any thing farther, than that the paper produced from cotton is extremely white, very strong, and of a fine grain.

III. OF PAPER FROM THE BARK OF TREES.

Before the use of parchment and paper passed to the Romans, they contrived to use the thin peel which was found on certain trees between the wood of these trees and their bark. This second skin they called *liber*, from whence we have derived the names of *library* and *librarian* in the European languages, and the French their *livre* for book. Anciently, instead of folding this bark, this parchment and paper, as we fold ours, they rolled it according as they wrote on it; and the Latin name which they gave these rolls has passed into our languages, as well as the others: we say a *volume* or volumes, although our books are composed of pages cut, and bound together.

The trees most commonly selected for this purpose were the maple, the plane-tree, the elm, the beech, the mulberry, and very frequently the linden-tree. The ancients wrote on this inner coat after they had separated it from the bark, beat, and dried it.

There are many palm-trees in India and America to which botanists have given the name *papyraceous*, because

the natives have written with bodkins either on the leaves or the bark. Such is the American palm, called *tal* by the Indians; and of the same kind is the *guajaraba* of New Spain. Every palm, the bark of which is smooth, and the leaves large and thick, may be used for this purpose.

Mabillon and Montfaucon speak frequently of manuscripts and diplomas written on paper made from bark; and positively distinguish it from the Egyptian paper, because it was thicker and more brittle than the papyrus, as well as more apt to cleave or shiver, by which the writing was sometimes lost; as is the case in a bark manuscript in the abbey of St. Germain's, where the bottom of the paper remains, but the outer surface, on which the letters had been drawn, is in many places peeled off. See Montfaucon, *Palæogr. Gr. lib. i. cap. 2.* and Mabill. *de Re Diplom. lib. i. cap. 8.*

But Maffei, it must not be forgotten, combats the whole system of bark manuscripts and charters as a popular error; and maintains, that the ancients never wrote diplomas on bark; that the distinction between the paper made of *papyrus* and of *cortex* is without foundation; that the only use of the *tilia*, or linden, was for making thin boards or tablets for *diptycha*, or pocket-books, wherein they wrote on both sides, as is done among us: an advantage which they could not have in the Egyptian paper, by reason of its thinness.

A French writer on the rules of criticism wanders still farther out of the way, when he speaks of a sort of paper, in Egypt, made of the *pith* of the cyprus: he describes the manner of preparation, which was by reducing this pith to a pulp, and then spreading it out in leaves. (See Hon. St. Marie Reflex. sur les Regl. de la Crit. tom. ii. diff. 77.) This we suspect for a chimera hatched only in the critic's brain. Not but there occur divers anomalous sorts of paper, which antiquaries are not a little puzzled what species to refer them to; such is that of two bulls in the archives of the church of Gironne, issued by the antipopes Romanus and Formosus, between the years 891 and 895. They are two ells long and one broad; and consist of two leaves or pellicles glued together transversely, and are still legible in most places. The conjectures of the French literati, in regard to these, are numerous; the abbot Hiraute de Belmont has a discourse expressly on the occasion. Some will have them made of the leaves of the *alga*, or sea-wreck; others of the leaves of a rush, called *la boga*, growing in the marshes of Rouffillon; others of papyrus; others of cotton, and others of bark. So little certainty does there really appear to be in these things, on which the critics nevertheless often lay a great stress. See Mem. de Trev. Sept. 1711.

IV. OF THE CHINESE PAPER.

The art of making paper from vegetables reduced to stuff was known in China long before it was practised in Europe: and the Chinese have carried it to a degree of perfection hitherto unknown to the European artists. The fine paper in China is softer and smoother than that of Europe; and these qualities are admirably adapted to the pencil, which the Chinese use in writing. Several kinds of their paper discover the greatest art and ingenuity, and might be applied with much advantage to many purposes. They are capable of receiving, for example, the impression of types; and both maps and prints have been executed with success on the Chinese paper.

The different sorts of paper vary in China according to the materials of which they are composed, and to the different manner of manufacturing those materials. Every province has its peculiar paper. That of Se-chuen is made of linen rags as in Europe; that of Fo-kien, of young bamboo; that of the northern provinces, of the interior bark of the mulberry; that of the province of Kiang-nan, of the skin which is found in the webs of the silk-worm; finally, in the province of Hu-quang, the tree chu, or kochu, furnishes the materials with which they make paper.

The

The method of fabricating paper with the bark of different trees is nearly the same with that which is followed in the bamboo. To give an idea, therefore, of the manner of manufacturing the interior barks of the mulberry, the elm, and the cotton-tree, it will be sufficient to confine our observations to the bamboo.

The bamboo (*Arundo bambos*) is a kind of cane or hollow reed, divided by knots; but larger, more elastic, and durable than any other reed. The whole substance of the bamboo, composed of filaments, and a great abundance of fibrous materials, is employed in this operation. The shoots of one or two years, nearly the thickness of a man's leg, are preferred. They strip the leaves from the stem, cut them into pieces of four or five feet long, make them into parcels, and put them into water to macerate. As soon as they are softened, which generally happens in five days, they wash them in pure water; put them into a dry ditch; cover them with lime for some days, which they water for the purpose of slacking; they wash them carefully a second time; cut every one of the pieces into filaments, which they expose to the rays of the sun to dry and to bleach them. After this they are boiled in large kettles; and then reduced to stuff in mortars of wood, by means of a hammer with a long handle, which the workman moves with his foot.

The stuff being thus prepared, they take some shoots of a plant named *ko teng*, which, steeped in water four or five days, is reduced to an unctuous or glutinous substance; and, when they proceed to make the paper, this is mixed with the stuff in certain exact quantities, for on this mixture depends the goodness of the paper.

When the extract from the *ko-teng* is mixed with stuff of the bamboo, the whole mixture is beat together in mortars till it becomes a thick and viscous liquor. This is poured into large tubs or reservoirs, so exactly framed as that no part of the liquor can escape. The workmen after this plunge their forms into the liquor; take out what is sufficient for a sheet of paper; which immediately, from the glutinous substance, becomes firm and shining; and is detached from the form by turning down the sheet on the heap of paper already made, without the interposition of pieces of woollen cloth, as in Europe.

But the Chinese often make their sheets of paper above twelve feet in length; and the celebrated Dr. Franklin has, in the American Philosophical Transactions, given the following account of the method used by them for making these extremely large sheets of paper; suppose of four and half ells long, and half an ell wide. They have two large vats, each five ells long, and two ells wide, made of brick and lined with plaster, that holds water; in these the stuff is mixed ready to work. Between these vats is built a kiln, or stove, with two inclining sides, each side something larger than the sheet of paper; they are covered with fine stucco, that takes a polish, and are so contrived as to be well heated by a small fire circulating in the walls. The mould is made with thin but deep sides, that it may be both light and stiff. It is suspended at each end with cords, that pass over pulleys fastened to the ceiling, their ends connected with a counterpoise nearly equal to the weight of the mould. Two workmen, one at each end of the mould, lift it out of the water by the help of the counterpoise, turn it up, and apply it, with the stuff for the sheet, to the smooth surface of the stove, against which they press it, to force out a great part of the water through the wires. The heat of the wall soon evaporates the rest, and a boy takes off the dried sheet by rolling it up. The side next the stove receives the even polish of the studs, and is thereby better fitted to receive the impression of fine colours. If a degree of sizing is required, a decoction of rice is mixed with the stuff in the vat. Thus, the great sheet is obtained smooth and sized, and a number of the European operations, of uniting the edges of several small sheets together, are saved. If the stove has two polished sides, and there are two vats, the same operation is, at the same time, performed by two

other men at the other vat, and one fire serves both. And thus the paper is dried almost as fast as it is made.

To harden the sheets, and make them bear ink, they dip them into a solution of alum. This operation is called *staining*, from the Chinese word *fan*, which signifies alum. The manner is this: Six ounces of isinglass, cut very small, are put in divers porringers of water, which they afterwards boil up, stirring it all the time to prevent lumps: when the whole is reduced to a liquid substance, they throw into it three quarters of a pound of calcined alum, which they melt and incorporate with it. This mixture is next poured into a wide basin, across which is laid a small round stick; then they shut the edge of each sheet in another cleft from end to end, and in this manner dip the sheet, gently drawing it out as soon as it is wetted, by sliding it over the round stick. When the whole sheet has been passed nimbly through this liquor, which makes it whiter, and more compact, the long stick that holds the sheet by the edge is stuck into a hole in the wall, and the sheet is left to dry.

Silvering of paper, as it is called, is another secret among the Chinese, practised at a very small charge, and without using any silver. In order to this, they take two scruples of glue, made of neats-leather, one scruple of alum, and half a pint of clean water: these they simmer over a slow fire, till the water is consumed, that is, till no more steam arises; then on a smooth table they spread some sheets of paper, and on this, with a pencil, they apply two or three layers of the glue; then they take a powder made of talc boiled, and mixed with one third the quantity of alum; the two are ground together, sifted, and the powder boiled again in water, then dried in the sun, and lastly pounded again. This powder they sift through a fine sieve, spreading it uniformly on the sheets prepared as above; after which they hang them in the shade to dry; and, this effected, they lay them again on the table, and rub them gently with clean cotton to take off the superfluous talc, which serves a second time for the same purpose. With this powder, diluted in water, mixed with glue and alum, they draw any figures at fancy on the paper. See Du Halde's Description. Chin. tom. i.

The paper made from the bamboo is sufficiently white, soft, closely united, without the least inequality on the surface to interrupt the motion of the pencil, or to occasion the rising of the materials which compose it. However, every kind of paper made from the bamboo or the bark of trees, is readier to crack than that made in Europe; besides, it is more susceptible of moisture, and sooner destroyed by dust and worms. To obviate this last inconvenience, they are obliged frequently to beat their books in China, and to expose them to the sun. It may be observed, however, that the Chinese paper, employed for various purposes in Europe, has been preserved for a long time without receiving damage either from moisture or insects.

In very ancient times, the Chinese wrote with a bodkin of iron on tablets of bamboo; afterwards on satin with a pencil; and about 160 years before Christ they discovered the art of making paper.

V. OF THE JAPANESE PAPER.

According to Kempfer, the bark of the *Morus papyrifera*, or paper-mulberry-tree, is that which is chiefly employed for making paper in Japan. Every year, after the fall of the leaves, which happens in the tenth month, corresponding to our December, the young shoots of this tree, which are very succulent, are cut off into sticks about three feet long, or something less, and put together in bundles, to be afterwards boiled with water and ashes. If they should grow dry before they can be boiled, they must be first soaked in common water for about twenty-four hours, and then boiled. These bundles, or faggots, are tied close together, and put upright into a large kettle, which must be very well covered; and then they are boiled till the

the bark shrinks so far as to let about half an inch of the wood appear naked at the top. When the sticks have all been sufficiently boiled, they are taken out of the water, and exposed to the air till they grow cold, then they are slit open lengthways, for the bark to be taken off; which being done, the wood is thrown away as useless; but the bark is dried and carefully preserved, as being the substance out of which they are in time to take their paper, by letting it undergo a farther preparation, consisting in cleaning it anew, and afterwards picking out the better from the worse. In order to this, it is soaked in water three or four hours, and, being grown soft, the blackish skin which covers it is scraped off, together with the green surface of what remains, which is done with a knife which they call *kaadsi kufaggi*, that is a kaadsi razor; at the same time also the stronger bark, which is a full year's growth, is separated from the thinner, which covered the younger branches, the former yielding the best and whitest paper, the latter only a dark and indifferent sort. If there be any bark of more than a year's growth mixed with the rest, it is likewise picked out, and laid aside as yielding a still coarser and worse sort of paper; all gross knotty particles, and whatever else looks in the least faulty and discoloured, is picked out at the same time, to be kept with the last coarse matter.

After the bark has been sufficiently cleaned, and prepared and sorted according to its different degrees of goodness, it must be boiled in clear ley. From the time it begins to boil, they keep perpetually stirring it with a strong reed, pouring from time to time so much fresh ley in as is necessary to condense the evaporation, and to supply what has been already lost by it; this boiling must be continued till the matter is grown so tender, that, being but slightly touched with the finger, it will dissolve and separate into flocks and fibres. Their ley is made of any sort of ashes, in the following manner: Two pieces of wood are laid across over a tub and covered with straw, on which they lay wet ashes, and then pour boiling hot water upon it, which, as it runs through the straw into the tub underneath, is imbued with the saline particles of the ashes, and makes what they call ley.

After boiling the bark as above described, follows the washing of it, which is of no small consequence in paper-making, and must be managed with great judgment and attention. If it has not been washed long enough, the paper will be strong indeed, and of a good body, but coarse and of little value; and if, on the contrary, the washing has been too long continued, it will afford a whiter paper, but such as will not bear ink. They wash it in a river, putting the bark into a sort of sieve, which will let the water run through, and stirring it continually with the hands and arms, till it comes to be diluted into a delicate soft pulp, or mucilage. For the finer sort of paper the washing must be repeated; but the bark must be put into a piece of linen, instead of a sieve, because, the longer the washing is continued, the more the bark is divided; and would come at last to be so thin and minute, that it would run out at the holes of the sieve and be lost. The bark, having been sufficiently washed, is put upon a thick smooth wooden table, in order to its being beaten with mallets of hard wood, which is commonly done by two or three people, until it is wrought fine enough, and becomes withal so thin as to resemble a pulp of soaked paper.

The bark, being thus prepared, is put into a narrow tub, with a glutinous extract from rice and the root *oreni*, which is very viscous. These three substances, mixed together, are stirred with a reed till they form a liquor of an equal and uniform consistency. This composition is poured into tubs similar to those used for filling the forms in our paper-mills.

As soon as the sheets are made and detached from the form, they are laid in a heap on a table covered with a double mat. A small slip of cane is placed betwixt every sheet. This piece of cane, jutting out, serves to distin-

guish the sheets, and afterwards to raise them. Every one of the heaps is covered with a plate or thin board of the exact size of the paper. In proportion as the paper dries, or is able to bear it without danger of being compressed into one mass, they lay on additional weights. This pressure, intended to carry off any unnecessary moisture, is continued for twenty-four hours, when the sheets are suspended, by means of the little pieces of reed, to long plants, in the open air, till they are completely dried.

The Japanese paper is of such prodigious strength, that the materials of which it is composed might be manufactured into ropes. There is sold at Serige, the capital city of the province of Japan of that name, a kind of it fit for bed-hangings and wearing-apparel; and so much resembling stuffs of wool and silk, that it is often taken for them.

VI. OF INCOMBUSTIBLE PAPER, FROM ASBESTUS.

Asbestos is a genus of talcose earth; (see the article MINERALOGY, vol. xv. p. 445.) and we have already, under the word ASBESTUS, vol. ii. described the process of making cloth from this mineral, or stone. It is still more extraordinary that paper can be formed of such a stubborn material; and paper, moreover, which cannot be burnt.

Dr. Bruckman, professor at Brunswick, has published a natural history of the asbestine or incombustible paper: and four copies of his book are printed on this paper: they are deposited in the library of Wolfenbittel. See Bibl. Germ. tom. xiv.

The manner of making this extraordinary paper is described by Mr. Edward Lloyd, from an essay made by himself. He pounded a quantity of the asbestos in a stone mortar, till it became a downy substance; then sifted it in a fine sieve, and by this means purged it indifferently well from its terrene parts; because the earth or stones he could not pick out of it before, or at the pounding, being reduced to a powder, came through the sieve, the fibre remaining. This done, he brought it to the paper-mill; and, putting it in water, in a vessel just big enough to make a sheet with such a quantity, he stirred it pretty much, and desired the workmen to proceed with it in the usual method, with their writing-paper mould; only to stir it about always before they put their mould in, it being a far more ponderous substance than what they used; and that consequently, if not immediately taken up after it was agitated, it would subside. The paper made of it proved but coarse, and was very apt to tear; but, this being the first trial, there is reason to believe it might be much improved; nor did the workmen doubt, but, in case it were pounded in one of their mortars for twenty hours space, it would make good writing-paper; and Mr. Lloyd (Phil. Trans. 1684) promised to make farther experiments; but we do not know that he did. The Encyclopædia Britannica says, that the writing disappears when cast into the fire; but does not inform us whether it re-appears again when the paper is withdrawn, and gets cold. Upon the whole, it is certainly an object more of curiosity than use. The asbestos, with which Mr. Lloyd made his experiments, was collected in the parish of Llanfair, in the northern part of the isle of Anglesey.

VII. OF PAPER MADE FROM LINEN RAGS.

Paper is now manufactured through all Europe of linen rags collected in the cities and in the country. This kind of paper was utterly unknown to the ancients. The *libri lintei* mentioned by Livy, lib. iv. Pliny, c. xi. and by other Roman writers, are demonstrated by Guilandinus, in his commentary on Pliny, &c. to have been written on pieces of linen cloth, or canvas prepared in the manner of painters.

But it is not sufficient to be certain that paper from linen is a modern invention; it is necessary to know by what nation, and at what period, it was discovered. Polydore

dore Virgil, *De Inventoribus Rerum*, c. viii. confesses his ignorance of these facts. Scaliger, without any kind of proof, gives the glory to the Germans; and Maffei to the Italians. Other writers ascribe this honour to some Greek refugees at Basil, to whom the manner of making paper from cotton in their own country had suggested the idea. Du Halde is persuaded that Europe derived this invention from the Chinese, who, in several provinces, make paper of rags, nearly in the same manner that we do. But this invention was practised by the Europeans before they had any communication with China, and before the taking of Constantinople, at which time the Greek refugees were supposed to have retired to Basil. The precise time of this discovery in Europe is not exactly known. Father Mabillon believes that it was in the twelfth century; and cites a passage of Pierre de Clugny, born A. D. 1100, to prove it. The books which we read every day, says that abbé in his treatise against the Jews, are written on sheep and calves skins; or on oriental plants; or, finally, *Ex raris veterum pannorum*. If these last words signify paper, such as we use, there were books of it in the twelfth century. But this citation is the more to be suspected, as Montfaucon himself, after the minutest search in France and Italy, could find no book on this paper antecedent to the death of St. Louis, A. D. 1270.

The epocha of this invention was not determined till 1762, M. Miérman having proposed a reward to the person who could procure the most ancient manuscript written on this kind of paper. The collection of all the memoirs sent to him along with the manuscripts was published at the Hague in 1767; and it appeared that this paper had not been used in Europe before the year 1300.

John Tate, who is presumed to have flourished about 1496, is said to have first made paper in England, or was at the expense of introducing the manufacture: for evidence is produced, that the English edition of Bartholomæus, printed by Wynkin de Worde, was the first book, for any thing we yet know to the contrary, that was printed upon paper made in this nation. *Fosbrooke's Records of Gloucestershire*.

The English manufacture was a long while in no great reputation; but it is every day improving; inasmuch that we now import little of the ordinary sorts, which were formerly all brought from abroad. Yet paper-mills are of some standing among us. We find one erected at Dartford as early as the year 1588, which was thought to have been the first, (but see above,) and which is celebrated by a noted poet of that age, Tho. Churchyard, in a work in verse, intitled "A Description and Discourse of Paper, and the Benefits it brings; with the setting forth of a Paper-mill, built near Dartford, by a High-German, called Mr. Spilman, Jeweller to the Queen." Lond. 1588, 4to.

Anderson (*Hist. Com.* vol. ii.) says, that till about the year 1690, there was scarcely any kind of paper made in England but the coarse brown sort: but, the war with France occasioning high duties on foreign paper, the French protestant refugees settled in England chiefly, and also our own paper-makers, now began to make white writing and printing paper, which, he adds, in length of time, has been brought to so great perfection, both for beauty and substance, that in our own time we import only certain kinds of Genoa and Dutch paper, which bears but a very small proportion to all the paper used in the British dominions. This has produced, it is said, a saving to Britain of 100,000*l.* which was paid annually to France for paper only. Another writer says, that the English manufactures now provide above seven-eighths of the whole quantity of paper consumed in Great Britain.

"In tracing effects to their true causes," says Mr. Landseer, (*Lect. on Engraving*, p. 198.) "it ought not to be forgotten, that the great benefits we have derived, and continue to derive, from engraving and printing, ought in fairness, to be partly ascribed to the discovery
Vol. XVIII. No. 1249.

of the means of converting rags into paper: this probably helped to suggest the idea of printing." Aware of the objection that would be made of the distance of time between the invention of the one and of the other, he qualifies it by saying, "and perhaps two centuries and a half had scarcely more than brought this invention to the degree of perfection necessary for the reception of impressions from types and engravings." He proceeds thus: "Had the modern art of making paper been known to the ancients, we had probably never heard the names of Faust and Finiguerra; for with the same kind of stamps which the Roman tradesmen used for their pottery and packages, books might also have been printed; and the same engraving which adorned the shields and pateras of the more remote ages, with the addition of paper, might have spread the rays of Greek and Etrurian intelligence over the world of antiquity. Of the truth of this assertion I have the satisfaction to lay before you the most decided proofs, by exhibiting engraved Latin inscriptions, both in cameo and in intaglio, from the collection of Mr. Douce, with impressions taken from them at Mr. Savage's letter-press but yesterday; and also a print, taken, with permission, from a Greek, Phrygian, or Etruscan, patera, in the Hamiltonian collection: the latter is a mere outline, in a bad style, of two figures in the Phrygian dress; and, though it possesses no merit in itself, it serves to show how little was wanting to the ancients of the modern art of printing from the incisions of the graver, and may be thought a curiosity, as being in all probability the oldest engraving in the world from which an impression has been taken on paper. The British Museum contains, moreover, two other ancient engravings, performed exactly in the same manner as we now engrave on copper for printing: of which one, the remains of a Greek parazonium, has been copied and accurately described by Mr. Strutt: the other is also classical both in composition and subject, and is cut on a patera of bronze: Venus attended by Cupid, is represented as preferring a complaint or imploring a favour of Jupiter; and Mercury, ordered on an errand, is in the act of departure, stepping through the zodiac."

That the art of printing and engraving should not be impeded in its progress when once discovered, it was necessary that we should have at hand a cheap material by the means of which books and prints might be multiplied. A more plentiful and economical substance could not be conceived than the tattered remnants of our clothes, linen worn out, and otherwise incapable of being applied to the least use, and of which the quantity every day increases: nor could a more ready operation be imagined, than a few hours' tritulation in a mill. It has been observed by a French writer, that the dispatch of the processes of paper-making is so great, that five workmen in a mill may furnish sufficient paper for the continual labour of 3000 transcribers. Whilst the Egyptian papyrus was the only kind of paper, it would have been impossible to have procured it in sufficient quantities to have made large editions of books. The cotton paper, though in a progressive state of improvement, was but a rude and perishable article, unfit for any of the nice purposes to which paper is now applied.

The perfection of the art of paper-making depended upon finding a material which could be procured in sufficient quantities, and which would be easy of preparation. Such is the paper now in use, of which we shall endeavour to describe the manufacture.

Of the ART of MAKING PAPER, as now practised in EUROPE, and chiefly in ENGLAND.

In detailing the modern process of making paper, we shall be chiefly indebted to the communications of a retired paper-maker, who permits us also to make use of his name; J. Bigg, esq. late of Iping Mills, near Midhurst in Sussex.

The principle upon which the formation of paper depends,

pend, consists in separating the fibres of the rags, by grinding, into exceedingly fine and short filaments, which, being mixed with water till they make a fine pulp, may be taken up in a very thin and even layer upon a mould of wire cloth. Now, by the draining away of the water through the wire, the filaments are left interwoven or felted so completely among each other, that they will not separate without breaking, and when dry will make a sheet of paper; the strength and quality of which depend very much upon the materials it is made from, and the equality of length and size to which the filaments are reduced by the grinding; which equality alone can cause them to float equally in the water of the pulp, and thus distribute themselves fairly and equally over the wire mould when taken up by it.

The operation of paper-making admits of three divisions; viz. I. The preparation of the rags. II. The forming of the sheets in the mill. III. The finishing of the paper.

I. PREPARATION of the RAGS.—The sorting of the rags is of no small importance in the art of making paper; for unless the rags, which are ground at the same time in the engine, are all of the same quality, both as to substance and condition, the finest and best parts will be ground away in the mill, and carried off by the water before the coarser are sufficiently reduced to make a fine pulp. For this reason, in the sorting of the rags which are intended to make fine paper, the hems and seams should be kept apart, and the coarseness of the cloth should be considered. That cloth which is made of tow should be separated from that which is made from the longer fibres; cloth of hemp from cloth of flax; and lastly, the degree of wearing in the cloth should be attended to. For, if rags almost new are mixed with those which are much worn, the one will not be completely reduced to a pulp, whilst the other will be so attenuated as to be carried off by the water, and pass through the hair-strainers of the engine; hence there must be a considerable waste in the operation, a real loss to the manufacturer, and even to the beauty of the paper; for the particles first carried off by the current of the water, are perhaps those which give it that smooth velvet softness which is so great a recommendation. When the sorting is imperfectly performed, the pulp or stuff is found to have cloudy parts floating in it, owing to some masses being less reduced than others. This produces those cloudy papers wherein are seen by intervals parts more or less clear, and more or less weak, occasioned by flakes assembled on the wire of the mould, which are not sufficiently tempered and diluted to incorporate with more fluid parts.

But as it is necessary, in many cases, to mix the different qualities of rags together, to produce various kinds of paper, this should be done by reducing the different sorts of rags separately in the mill, as also the hems and threads of the stitching, because the fowing-thread, being never so much worn as that of the cloth, and not so easy to be reduced, forms filaments in the paper. When the rags unequally disposed for trituration, have been ground apart, the different pulps may be mixed together without inconvenience, and will be found homogeneous or alike, each having been ground during the time that was necessary for the state of the rag. Without this precaution, the finest particles will be always lost, and of course the beautiful quality of the paper will be altered by the coarsest. Therefore this care in sorting the rags produces a great beauty of the paper, without hurting its goodness. It will, besides, be attended with the advantage of mixing a pulp, which will form the strength of the paper, with another which will give it softness and lustre; and thus two qualities may be united which otherwise existed separately.

The rags are then put into a machine called a *duster*, made in the form of a cylinder, four feet in diameter and five feet in length. It is all through covered with a wire net, and put in motion on pivots at its ends by a connection with some part of the machinery. The whole is

inclosed in a tight close box. A convenient quantity of rags, after being cut into pieces about four inches square, is inclosed in the cylinder of the duster, and its motion separates the dust from them, and it passes through the wires into the box.

The sorting is performed by women and children, who are seated on benches, in a large room full of old linen, before a chest, which is divided into four boxes, to receive as many different sorts of rags. Each woman has a piece of pasteboard, hung from her girdle, and extended on her knees, upon which, with a long sharp knife, she unrrips seams and stitches, and scrapes off all filth. Whatever can be used, after being well examined, is distributed into one of the four boxes, according to the degree of fineness, and the women throw the rest at their feet. The four boxes are for the different sorts of rags: the superfine; the fine; the middling; and the coarse; without including the very coarse parts, which are totally rejected, at least for the making of white paper, but may serve for white-brown paper; but even for this purpose they should be mixed up with a large parcel of coarse linen. Old paper may also serve for the same use, but the waste is considerable; it is therefore reserved for pasteboard, in the manufacture of which, the stuff being worked less time in the engine, and with less force, though with the same water, it will lose much less than if worked sufficiently to make paper.

Paper intended for bills of exchange, or other commercial and legal instruments, ought to be tough, in order that it may not be easily torn, when made as thin as it is necessary to be, for the ease of conveyance by post. For this, paper rags of the best quality must be entirely, or in large proportion, employed; and the price which the consumers are disposed to pay for the article, is sufficient to allow the best materials, and still indemnify the manufacturer for his care and industry. Rags imported from the continent are bad to make into writing-papers, it being very difficult to size them sufficiently hard. The rags which are free from sheave, or the woody parts of the flax, and soft, are best.

Common papers require to be more or less tough, according to their thickness, and the use to which they are applied; but a clear white colour is sought in paper of every description, whether for writing or printing. The manufacturers of paper were formerly obliged to attend to the colour of the rags in the sorting, as well as to their qualities; but of this care they are now in a great measure relieved by the introduction of *bleaching*, which enables them to produce the finest paper, in point of colour, from any kind of rags. They have only therefore to find such materials as will make paper of a strong texture, and a fine even surface, knowing they can produce colour at pleasure. To bleach the rags by the oxymuriatic acid gas, they are first washed in hot water, by a fulling-mill, such as is used for scouring cloth: this removes the dirt, and they are put into a receiver or chamber, made of wood, in a cubical form, and the joints airtight. It is provided with several stone retorts, which being filled with a mixture of manganese, with two-thirds its quantity of sea-salt, and a quantity of sulphuric acid equal to the salt, will, when moderately heated by a small sand-bath furnace, throw into the receiver a gas which quickly discharges any colour the rags may contain. This process, which is very similar to that used for bleaching cotton thread, was invented by Mr. Campbell, who had a patent for it in 1792. In his specification, he directs that the rags should, before they are put into the receiver to be bleached, contain about their own weight of fair water, the super-abundant water being pressed out. The rags should first be opened by a machine, called by the cotton-manufacturers a *devil*, or some machine of that nature; and they are to be distributed in the receivers, in layers spread on frames, so that they will not come in contact with each other; or they may be placed in the body of the receiver, and have stirrers or agitators provided,

to expose every part of them to the action of the bleaching gas.

After the process, which must be concluded as soon as ever the rags are sufficiently bleached, lest the gas should act upon and injure their quality, they are to be washed in water, and will be ready for the mill. Some manufacturers think that this mode of bleaching the rags makes them rotten, and injures the quality of the paper; which it certainly does if carried too far, though there is no doubt of the advantages of the process if well conducted.

The bleaching-process has given rise to great complaints from the printers, as many printing-papers are now made from cotton-rags. The oxygenated muriatic acid, being applied for the purpose of obtaining dispatch and delicacy of colour, produces a paper of a good appearance from an inferior staple. Nothing can be more perplexing to a printer, nor more detrimental to his labours, than this kind of bleached paper; for, although it may be thick, and seem strong in the ream, no sooner does the water penetrate through it, than it loses its adhesive quality, and becomes so loose and soft as scarcely to bear handling, and in working under the press sinks down into the cavities of the letters, leaving a part of its substance behind, after every impression, until it so clogs the type that the work is rendered scarcely legible. Nor is it less exceptionable in point of durability, as it must moulder away in a little time, with the common use that popular books generally undergo. Notwithstanding this, it must be allowed, that if, by bleaching, the paper-makers can produce a bad article from such materials as were otherwise of no use, they are also able to improve their manufacture when they use the same materials as formerly. It is found most advantageous to bleach the rags in the state of half-stuff, that is, when they have been once worked by the mill, as, the fibres being by that means separated, the gas has greater access to the interior parts, and they are bleached quicker, so as to have less danger of injury to particular parts, by too long an action of the gas. Another method of bleaching, is by muriatic of lime put into the washing-engine, which for printing-papers is that now most commonly used. But Mr. Bigg's process is intended to apply to the paper not only after it is made, but even after it is printed; and it has the effect also of restoring damaged or mildewed *printed* paper, not only without injuring the type, but even greatly to improve the brilliancy of it. This has been given under the article BLEACHING, vol. iii. p. 102.

The rags are now ready to be thrown into the washing-engine of the paper-mill; which brings us to the second and most important operative section.

II. FORMATION of the SHEET in the MILL.—The engines now used in paper-mills are constructed on such a powerful principle, that they are capable of reducing the strongest and toughest rags to pulp in a moderate time; whereas the old machines were not able to work the rags without *fermenting*, or *rotting*, them, as a previous process. The following extracts from a French work on the art of making paper, will show the manner in which it was conducted sixty years ago.

"The rags, being sorted, are put into a large stone vat, sixteen feet long, ten broad, and three deep; water is poured upon them at the top during ten days, and eight or ten times every day, without stirring them. They are afterwards left to rest the same number of days, and sometimes more or less, without pouring water upon them. Then, being turned over, the centre is brought to the surface, to facilitate the fermentation; and, after being turned again, they are still left fifteen or twenty days in fermentation, so that the rotting may last five or six weeks; the term is not fixed, but when the heat becomes so great, that the hand, thrust in, cannot endure it above some seconds, it is judged that it is time to stop it. In mills which have but few rags to work upon, they are left to rot longer, because the heaps, being smaller, heat less, and

with more difficulty; so that nothing can be justly determined of the time proper for the rotting part. It depends also on the quality of the rags; the finest linen does not rot so soon as the coarse; and linen that has been worn with more difficulty than new, because the internal humidity, that disposes the fibres to fermentation, is more considerable in new or coarse than in fine or worn linen. Such as are more or less strong, more or less worn, resist the action of rotting in different degrees, some being spoiled when others have not gone through the first fermentation; so that the rags, which have been sorted with great care, ought to be left to rot together, to avoid the risk of altering the whole parcel, by the mixture of a portion of rags quite different from the rest. When champignons grow on the heaps of rags, it is reckoned to be a sign of their being well rotted.

"Besides this, there is another method for disposing of the rags in the place for rotting and fermenting them. Having been wetted with water, a heap is made of them in a corner of the vaulted room, which is destined for that purpose. They are watered from time to time, and, when sufficiently heated, are transported into another angle of the same room, so that what was at the top of the first heap is now laid under the second; and care is taken to throw water upon them from time to time. When this heap takes heat again, it is transported to the third corner, where, having fermented again, it is carried into the fourth angle; observing always to lay those rags under the heap that were at the top of the foregoing, and to water them often; for a reddish water will come from them, which it is very necessary to clear the rags of. When the heap in the first corner is brought away, another is formed in the same corner, which passes in its turn to the several corners of the room.

"Some, to accelerate the operation of rotting and fermenting, throw lime upon the rags. Perhaps a very small quantity of lime may be used; but, if too much is laid on, the corroded rags will be too soon reduced into a pulp, and will pass through the strainer with the water, which ought to carry off only their filth, and will occasion a considerable waste. The use of lime, for the purpose of rotting rags, is absolutely prohibited in France."

The action of rotting was, at that period, thought necessary for abridging the labour of making paper, and facilitating the operation of the mill; but several advantages are procured by dispensing with it, now we are able to destroy the texture of the cloth, and reduce it to pulp, without previously corrupting its substance by rotting it; the paper is much stouter, is less liable to break, and is also whiter; for the fermentation gave a yellowish hue to the surface of the rags, which the mill could not take out without difficulty, and never could entirely, if the rags were too rotten.

We now come to describe the structure of *paper-mills*. In England they work with cylinders, or engines, an invention which was brought from Holland many years ago, and found to be so great an improvement, that it has been universally adopted. The old mills, which are still in use in some parts of the continent, actuate a number of stampers, or pestles, which pound the rags in wooden mortars till they are reduced to a pulp. These mortars are cut out in a block of heart of oak, well seasoned, the cavity being of an oval figure, about eighteen inches broad, thirty inches long, and eighteen or twenty in depth; the bottom concave, and lined with an iron plate an inch thick, eight inches broad, and thirty long, shaped inwards like a mould for a salmon, with the head and tail rounded. In the middle of the mortar is a cavity beneath the plate, and four or five grooves are cut, forming channels which lead to a hole cut from the bottom of the cavity quite through the block: it is covered by a piece of hair-sieve fastened on the inside. This plate is grooved to make teeth, on which the teeth of the hammers act, to cut the rags in pieces. The use of the hair-sieve is to prevent any thing from going out but foul water. Two hammers, or pestles,

pestles, work side by side in each mortar, and are lifted alternately by the mill; they are sometimes made in the same manner as the stampers of an oil-mill, to lift perpendicularly. In other mills they are large hammers moving on a centre like a fulling-mill, and lifted by cogs upon the mill-shaft in the same manner. The mortars are kept constantly supplied with fair water, by little troughs, leading from a cistern, which is kept full by small buckets affixed to the floats of the water-wheel; these, when they have raised the water to the top, pour it out into the cistern in the same manner as the Persian wheel, which see under MECHANICS, vol. xiv. p. 761, 2.

This rude and imperfect machine operated very slowly, and suffered a great part of the rags to escape being reduced, whilst other parts were beaten too much. It is not now to be met with in England, the engines having taken their place, to the great improvement of the paper-trade; these are turned by water-mills, as they require a very great power to actuate them, though their performance is far greater, with the same power, than the mortars.

The construction of an improved English paper-mill, similar to that used by Mr. Bigg, is represented on the annexed Plate. Fig. 1. is the general view, or elevation. The wheels in immediate view are of iron; but the water-wheel, which gives the motion, cannot be seen, as it is situated beneath the floor; it is enclosed between the walls of the house PP, and another wall Q, which is built up across the house, to support the floors N and O, on which the engines stand: the wall has arches in it to admit the water of the stream to the wheel, a proper gate being fixed to regulate its quantity: the axis of the water-wheel, which is of cast iron, comes through the wall Q, and has a large cog-wheel B upon it, which is the full size of the water wheel, and by the paper-makers is termed the *master-wheel*; the extreme end of the shaft is sustained in a bearing, which lies on a beam GG, supported on a wall of masonry. The pinion C, called the *wallower*, is turned by the master-wheel B, and on its axis is fixed the large spur-wheel D, called the *fly-wheel*, giving motion to the two pinions, E, F, of the engines K and L; the shaft of the wheel D and pinion C are supported at one end in a frame H H I, and the other, in a bearing fixed in the wall Q. The engines K and L are placed on the floors N and O upon different levels, the bottom of L being higher than the top of K, so that the contents of L may be let down through a plug-hole in the bottom. The upper engine L is called the *washer*, where the rags are first worked coarsely, with a stream of water running through them to wash and open their fibres; after which washing they are let down into the *beating-engine* K, to be ground, and reduced to a finished pulp, proper for moulding into sheets of paper.

By the arrangement of the wheels of the mill, the cylinders of the two engines are contrived to make about from 120 to 150 revolutions per minute, when the water-wheel moves with its proper velocity; though the beating-engine revolves much quicker than the washer, its pinion, E, having only 24 teeth, while the washer, F, has 28. The great wheel, B, has 196 teeth, and the pinion, C, 38 teeth; therefore it makes about $5\frac{1}{2}$ turns, for one of the water-wheel. The wheel D has likewise 196 teeth, and turns the washer, F, of 28 teeth about 36 times, for once of the water-wheel, and the beater, E, about 42 times. M is a cog-wheel, put in motion by the teeth of the great wheel B: on the extremity of its spindle is a crank *a*, which, by a connecting rod, gives a reciprocating motion to a lever *e d*, for the purpose of working two pumps, *e, f*, which raise water into a cistern *h*, drawing it from the water of the mill-dam by a suction-pipe *g*. These pumps raise up a constant stream of fair water, which is necessary to be kept running through the rags in the washing-engine, to carry away the dirt separated from them by the operation.

The structure of an engine is more minutely explained

by figs 2, 3, 4, 5. fig. 2 being a section through the length of the engine, and fig. 3 a horizontal plan. The large vat or cistern, A A, is of an oblong figure on the outside, the angles being cut off; but the inside, which is lined with lead, has straight sides and circular ends. It is divided by a partition B B, also covered with lead. The cylinder C is fixed fast upon the spindle D, which extends across the engine, and is put in motion, as before described, by the pinion E, placed on the extremity of it. The cylinder is made of wood, and furnished with a number of teeth, or cutters, fixed fast on its circumference, parallel to the axis, and projecting about an inch, as is shown on a larger scale at fig. 4. Immediately beneath the cylinder, a block of wood, H, is placed, and provided with similar cutters to those of the cylinder, which, when they revolve, pass very near the teeth of the block, but do not touch; the distance between them being capable of regulation, by elevating or depressing the bearings on which the necks, D, D, of the spindle are supported. These bearings are made on two levers, F, F, which have tenons at their ends, fitted into upright mortises, made in short beams, G, G, bolted to the sides of the engine. The levers, F, F, are movable at one end of each, the other ends being fitted to rise and fall on bolts, in the beams G, as centres. The front one of these levers, or that nearest to the cylinder C, is capable of being elevated or depressed, by turning the handle of the screw *b*, which acts in a nut fixed to the tenon of F, and comes up through the top of the beam G, upon which the head of the screw takes its bearing. Two brasses are let into the middle of the levers, F, F, and form the bearings for the spindle of the engine to turn upon. The screw *b* is used to raise or lower the cylinder, and cause it to cut finer or coarser, by enlarging or diminishing the space between the cutters in the block and those of the cylinder.

Near K, figs. 2 and 3, is a circular breasting made of boards, and covered with sheet-lead; it is curved to fit the cylinder very truly, and leaves but very little space between the teeth and breasting. An inclined plane, K, fig. 2, leads regularly from the bottom of the engine-vat to the top of this breasting; and at the bottom of it the block, H, is fixed. The engine is supplied with water by a pipe, Q, fig. 3, bringing it from the pump: this pipe delivers it into a small cistern, M, adjoining, and communicating with the engine. The pipe has a cock, P, to stop the entrance of the water when required, or to regulate the quantity of its discharge. This cistern has a grating fixed across it, covered with a hair-strainer, to catch any extraneous matter which may come in with the water; or a flannel bag is sometimes tied over the orifice of the cock P, through which all the water must be filtered. When the engine is filled with water, and a quantity of rags put in, they are, by the revolution of the cylinder, drawn between its cutters and the teeth of the block H. This cuts them in pieces; then, by the rapid motion of the cylinder, the rags and water are thrown over the top of the breasting, upon the inclined plane: in a short time, this raises more rags and water into that part of the engine-vat; and the tendency to restore the equilibrium puts the whole contents of the vat in slow motion, down the inclined plane K, and round the partition B B, by which they come to the cylinder again in about the space of twenty minutes; so that the rags are repeatedly cut and chopped in every direction, till they are reduced to a pulp.

This circulation is of advantage, in turning the rags over in the engine, and causes them to present themselves to the cutters in a different direction every time; for, as the cylinder cuts or clips in straight lines, in the same manner as a pair of shears, it is requisite to cut the rags across in different directions, to reduce them to a pulp. The manner of the cutting is this: the teeth of the block are placed rather inclined to the axis of the cylinder, as shown by fig. 5. but the teeth of the cylinder are parallel to its axis; therefore, the cutting edges, when they meet, are at a small angle, and come in contact first at one end, and

Improved Paper Mill.

and then successively the contacts proceed along to the other end, so that any rags interspersed between them are cut in the same manner as they would be between the blades of a pair of shears. Sometimes the plates or cutters, *k*, in the block, are bent to an angle in the middle, instead of being straight, and inclined to the cylinder: in this case, they are called elbow-plates, and of course the two ends are both inclined to the axis of the cylinder in opposite directions. In either case, the edges of the plate of the block cannot be straight lines, but must be curved, to adapt themselves to the curve which a line traced on the cylinder will of course have. The plates or cutters of the block are united, by screwing them all together, and fitting them into a cavity cut out in the wooden block *H*; their edges are bevelled away on one side only, as shown at *k* in the section fig. 5. The block is fixed in its place by being made dovetailed, and truly fitted into the bottom of the cistern, so that the water will not leak by it. The end of it comes through the wood-work of the chest, and projects a small distance on the outside of it, being kept up to its place by a wedge; so that, by withdrawing this wedge, the block becomes loose, and can be removed, to sharpen the cutters, as occasion requires. This is done on a grindstone, the plates being first separated from each other.

The cutters of the cylinder are fixed into grooves, cut in the wood of the cylinder, at equal distances from each other round its circumference, in a direction parallel to its axis: the number of these grooves is twenty; and, for the washer, each groove has two cutters or bars put into it; then a fillet of wood is driven fast in between them, to hold them firm; and the fillets are kept fast by spikes driven into the solid wood of the cylinder. The beater is made in the same manner, except that each groove contains three bars, and two fillets, as shown in fig. 4.

In the operation of the cylinder, it is necessary that it should be inclosed in a case, or its great velocity would throw all the water and rags out of the engine. This case is a wooden box *L L*, fig. 2. inclosed on all sides except the bottom: one side of it rests upon the edge of the vat, and the other upon the edge of the partition *B B*. The lines *c c* represent the edges of wooden frames, which are covered with hair or wire cloth; and immediately behind these, the box is made with a bottom, and a ledge towards the cylinder, which makes a complete trough. The dark spaces, *e, e*, in fig. 2, show the situation of two openings or spouts, through the side of the case, which lead to flat lead-pipes, *h, h*, fig. 3, which are placed by the side of the vat; the beam, *F*, being cut away for them. There are waste-pipes, to convey away the foul water from the engine; for the cylinder, as it turns, throws a great quantity of water and rags up against the sieves: the water goes through them, and runs down into the trough at *e e*, and from thence into the ends of the leaden pipes, *h, h*, fig. 3, by which it is conveyed away: *d, d*, fig. 2, are grooves for two boards, which, when put down in their places, cover the hair-sieves, and stop the water from going through them, if it is required to retain the water in the engine. This is always the case in the beating-engines, and therefore they are seldom provided with these waste-pipes, or at most on one side only; the other side of the cover being curved, to conform to the cylinder. Except this, the only difference between the washing-engine and the beater is that the teeth of the latter are finer, having 60 instead of 40 bars on its circumference; and it revolves quicker than the washer, so that it will cut and divide those particles which pass through the teeth of the washer.

In small mills, where the supply of water is limited, they frequently have but one engine, and use it both for washing and beating, by setting the screw so as to let the cylinder down and make its teeth cut finer; but the system of all considerable works is to have two engines, or four if the supply of water is sufficiently great. We have seen a very capital paper-mill containing five engines, where three of them are beaters and two washers; because the beating takes so much more time, that, when

the numbers are equal, the washers will often do too much for them, and they will have to stand still. A mill to drive four engines is generally made double, that is, it has two water-wheels, and all the machinery shown in the plan; and, if either of these give motion to three engines, they are arranged rather differently: thus the two beaters are placed on the same level with each other, and this removes them to a greater distance asunder than shown in fig. 1. so that the ends of the two engines, when placed on the same floor or platform, will just touch each other. The washer is then placed on the opposite side of the wheel *D*, its pinion being upon the summit of the wheel, which raises it to the proper level: the vat of the washer has a valve in each end, to let out its contents into either of the beaters at pleasure.

The quantity of water which a paper-mill can command to turn its engines, generally limits the extent of its trade; and hence the manufacturers should attend to every improvement of the machinery which can increase their effect. Where the supply of water is constant, they work the engines day and night, though the making the paper, as it requires many workmen, is of course carried on in the day-time only. This system necessarily requires a large vat to be provided, which is called the *stuff-chest*, and is a general receptacle for the pulp, where it is kept till wanted to be made into paper; at the same time this mixes the pulp of different days' work together, and produces an uniformity in the quality and colour of the paper, which is a great recommendation for printing large editions of books.

A very large and capital paper-mill, at Maidstone in Kent, is worked by steam-engines, and is found to answer very well. The machinery and building of a paper-mill should be well made, and firmly put together, otherwise its great velocity, and power, produces a tremor, which in time shakes every thing to pieces. The noise and vibration of a washing-engine is most tremendous; for, when it revolves 120 times per minute, and has 40 teeth, each of which passes by 12 or 14 teeth in the block at every revolution, it will make near 60,000 cuts per minute, and each of them sufficiently loud to produce the most horrible growling sound which can be conceived. The beater, revolving quicker, having 60 teeth, and 20 or 24 cutters in the block, will make 180,000 cuts per minute, which is so rapid, as to produce a coarse musical note or humming, which may be heard at a great distance from the mill. This great number of cuts will account for an engine being able, in the course of four or five hours' working, to reduce a quantity of rags to those exceedingly minute filaments of which paper is composed.

The first and most material point to be attended to in the manufacture of paper, is the preparation of the stuff in the engines; and, unless that is properly done, it will be impossible to make good paper.

When the rags are put into the *washing-engine*, the roll should be let down so as to gently rub on the plate; and, as the rags begin to open, keep letting down the roll so as to bear on the plate just enough gradually to open the rags into a *lint-state*, by which the foulness will pass off as they keep opening into lint; and they will be perfectly washed, clean, and fit for the beating-engine, in four hours or four hours and an half. By thus gradually opening the rags into a lint-state, a very little waste of stuff will take place from the finest parts of the rags to what occurs in the common method that is used, of suddenly laying down the roll, and tearing the rags into what is termed *half-stuff*, by which method a very great waste of stuff takes place, from the finest parts of the rags passing away with the foul water forced through the washing-wire; and it is also injurious to the preparation of the stuff in the next process in the beating-engine. It is particularly to be attended to, that the bars in the roll, and also of the plate in the washing-engine, should not be sharp, *not* in a cutting-state, but in such a state as to gradually rub the rags into a lint-state as the washing-process goes on. By

this means the stuff will be completely washed, the texture of the rag uninjured, and very little waste of stuff will take place.

For the *beating-engine*, Mr. Bigg recommends what is called a *jaw-plate* for all kinds of paper, excepting very thin papers, for which a plate like the washing-engine plate is best. The bars of the roll and plate to be dull, if for very thin papers, by which means the stuff will work wet on the mould, and form a very strong paper. The process of beating will take about four hours for thick papers; and, for thin and very thin papers, the plate and bars of the roll being properly dull, will take from nine to twelve hours. The thinner the paper, the more time will be required in the process of beating, on which every thing depends to produce a strong firm paper; for, in case it is hurried, by having your plate and the bars of the roll too sharp, it is impossible to manufacture a strong, clear, and even, paper, as the stuff will not hold water sufficient to give a good strong texture to the paper in moulding it.

When you think the stuff sufficiently beaten, try it, by taking a basin of clear water, into which put as much pulp as will lie upon your four fingers, and triturate it with your hand two or three minutes: it will then, if properly beat, float in clear and beautiful clouds, like what is called a mackerel-sky in the atmosphere; and, if handled as it turns in the beating-engine, it will be very soft and smooth to the feel, and numerous small air-bubbles will then arise as it turns in the engine: these will quickly break and disappear, and keep in quick succession arising and breaking. If, on trying the stuff in the basin as above, the stuff appears very clear and free from knots, threads, and lumps, it is certain of being properly beat. The pulp, properly beat for very thin papers, should be long, and clear from knots and threads, and float clear in the basin without sinking quickly.

The fairest water is the best for paper-making, on account of the clean and white quality so desirable in the manufacture. The water that dissolves soap best is also the fittest for taking the grease out of rags. Paper-makers say that the water which is most beaten, and that which comes from afar, makes a better curdled paper, flouter, and of stronger consistence, as to matter: if this be the case, it is probably because this water has had more time for depositing the slime, and other heterogeneous parts, and that, being more exposed to the air by motion, it is thereby in a better condition for dissolving grease and soap. Water subject to be muddied by rain, and that which runs through marshy grounds, ought to be avoided. Neither ought a paper-mill to be placed below other manufactories or machinery, which, by using the same water, might communicate to it a bad quality. The water of ponds, and rain water, are very good for dissolving soap, and may therefore be used for paper, if otherwise in a pure state. Water impregnated with lime, by having run off from chalky soils, is generally very pure and clear to the eye, and is therefore much used for paper-making; but it is apt to deposit a slight incrustation upon the brass wire of the moulds, which they remove by occasionally washing them with vinegar.

For printing-papers, the sizing is done in the beating-engine, towards the end of its operation, as we shall describe: the size is necessary to prevent the ink from sinking into the paper like blotting-paper; but, printing-ink not being so fluid as writing-ink, the paper can be sufficiently sized in substance, without subjecting the sheets to a separate operation after they are made. The size for the engine is composed of alum pounded very fine, and mixed up with a quantity of oil: about a pint and a half of this mixture, thrown into the engine at intervals, during the last half-hour of the beating, is sufficient. In order to give that bloom, or blue cast, to the paper, which some kinds have, a quantity of powder-blue is frequently put into the engine at the same time. The pulp is now run off into the *stuff-chest*, where the different kinds are

mixed; and it is taken out as it is wanted, in the vats where the dippers, &c. work to form the sheets.

The *moulding* of the paper should be carried on in a lofty room, well ventilated, and with a smooth and even ceiling, that the steam arising from the several vats of pulp may not be condensed upon it, and fall in drops; for a single drop, falling upon a sheet of paper whilst it is moulding, will beat a hole through it, or at least spoil it. The people in this apartment work at the vats, with moulds, deckles, felts, vat-presses, and wet-presses.

The *vat* used to contain the pulp is a tub, generally about five feet in diameter, and two and a half in depth. It is provided, on the upper part, with planks enclosed inwards, and even railed in with wood, to prevent any of the stuff from running over in the operation: a plank, pierced with holes at one of the extremities, is placed across the vat, and, resting on the planks which surround the vat, forms a support to rest the mould upon when a sheet of paper has been made, and it remains here a short time to drain off the superfluous water. The stuff in the vat is kept at a proper temperature, by means of a grate introduced at a hole in the side, and surrounded on the inside of the vat with a case of copper. For fuel to this grate charcoal or wood is used, and frequently, to prevent smoke, the wall of the building comes in contact with one part of the vat, so that the fire has no communication with the room where they make the paper.

The *mould* is a square frame, or shallow box, made of well-seasoned mahogany, and covered at the top with wire-cloth; its dimensions are an inch or an inch and a half larger than the sheet of paper intended to be made upon it. The wire-cloth of the mould is varied in proportion to the fineness of the paper and the nature of the stuff. It consists of a number of parallel wires stretched across the frame, very near together, and tied fast through holes in the sides; also a few other stronger wires, extending across in a direction at right angles to the former, and a considerable distance asunder, the small wires being bound down to them by fine wire at the intersections. This may be readily understood, from the examination of a sheet of some kind of paper on which the marks of the wires remain, because the paper is thinner in those places where the wire touched it. By a modern improvement, these marks, called *water-marks*, are avoided, and the paper has a smooth even surface. For this, the wire is wove in a loom, exactly like cloth, and stretched over the frame of the mould. The wire-cloth is in this case made larger than the intended sheet of paper, and turned down over the sides of the frame, being sewed fast to it by fine wire, so that the cloth is strained tight over the frame. The *wove-paper*, as it is called, when made on these moulds, is a very superior article to the old paper, particularly for books; but a prejudice still prevails in favour of the old paper with lines, which obliges manufacturers still to make it, though by no means so fine or good as the wove.

The *deckle* is a square frame of mahogany, bound with brass at the angles; it is made very thin, and its outside corresponds with the sides of the mould, while the inside is the size of the sheet. This frame is necessary to retain the stuff of which the paper is made on the cloth; and it must be exactly flat, that it may fit upon the wire-cloth of the mould, otherwise the edges of the paper will be ragged and badly finished. The deckle, when placed upon the wire of the mould, forms a shallow sieve or mould, in which a quantity of the pulp is taken up; and, by the draining-through of the water, the pulp is left in a sheet upon the wire. There is no fastening for the deckle, as it is movable, and only held upon the mould by the workman grasping the mould and deckle together in both hands at the opposite sides. This admits of the deckle being removed, that the sheet of paper may be taken up from the wire, by applying the mould upon a piece of felt.

The *felts* are pieces of woollen cloth, spread over every sheet of paper, and upon which the sheets are laid, to detach them

them from the wire of the mould; they also prevent them from adhering together, and, imbibing part of the water with which the paper is charged, transmit the whole of it when placed under the action of the vat-press.

The moulding of the paper is performed by three workmen, the *dipper*, the *coucher*, and the *lifter*. The first of these, having filled the vat with pulp, must be attentive to mix it up well; for this purpose, he employs two implements, one of which is a simple pole, and the other a pole armed with a piece of board, rounded and full of holes. This operation is repeated as often as the stuff falls to the bottom. In the principal mills they use for this purpose what is called a *hog*, which is a machine within the vat, that, by means of a small wheel on the outside, is made to turn constantly round, and keep the stuff in perpetual motion. The dipper stands in a niche, or hollow part, of that kind of ledge or table which goes round the circumference of the vat; he holds the mould in both hands, by the two extremities, with the deckle applied exactly over it, as if only one piece; then, inclining it a little towards him, he dips it into the vat, and brings it up again into a horizontal position. The superfluous part of the pulp flows over on all sides, and the quantity thought sufficient is shaken gently from the right to the left, and up and down horizontally, until it is equally extended over the whole surface of the mould. These two motions are also accompanied by a slight shake, that serves to fix and stop the sheet. As the water drains through the wire, the fibrous parts of the stuff arrange themselves regularly on the wire-cloth of the mould, not only in proportion as the water escapes, but also as the workman favours this effect by gently shaking the mould. This done, the mould is immediately laid on the edge of the vat, the deckle taken off, and the mould made to slide along the board which is laid across the vat, to the part where the sheet is to be laid or taken off. This board, which is but two inches in breadth where the sheet is laid, is nothing more than a deal board, which runs along the length of the vat, and is pierced with several holes at the extremity, for letting the mould drain into the vat. The dipper, taking the deckle off the first mould, places it immediately on a second, which is given him for dipping in its turn; and the second workman, called the *coucher*, taking the mould off the board that runs across the vat with the left hand, raises it gently, and lays it in an inclined position against one or two small pins, which are driven into the board on the edge of the vat. In this condition the mould remains two or three seconds of time for draining into the vat, whilst the coucher extends a felt, on which he applies the mould to take off the sheet; which being done, he returns the mould to the dipper. They proceed in this manner, laying alternately a sheet and a felt, till they have made six quires of paper, which is called a *post*; and this they do with such swiftness, that in many sorts of paper two men make upwards of twenty posts in a day.

When the last sheet of the post is covered with the last felt, all the workmen about the vat unite together, and submit the heap to the action of the *vat-press*. They begin at first to press it with a middling lever, and afterwards with a lever about fifteen feet in length.

The dipper should be attentive, in distributing the matter on the mould, to reinforce the corner the coucher is to take hold of, in raising and extending the sheets; for, without this precaution, he would break a great many. Also, if he takes up too much matter with his mould, if he does not equally extend it, or if he strikes his mould against the drainer; in all these cases the matter is accumulated in certain parts of the mould, producing something like ridges in the paper; or, if he lets the matter rest on the mould, and does not distribute it immediately, there will be parts of unequal thickness. When the vat is too hot, the stretching-out of the sheet will be ill performed, because the water evaporates too soon from the mould. Add to this, that in letting the matter run towards one of the edges, by not giving his arm a regular

motion, he may form a feather-edged paper; which may likewise happen if he does not extend his stuff sufficiently, or if the vat be too hot, or the fecula of the pulp too crude, so as not to run well; if his arms are too stiff, and if he gives a bad shake; or if the mould be ill made.

In consequence of the construction of the mould, it is easy to perceive that the sheets of paper will take, and preserve, the impression of all the wires which compose it, and of the empty spaces between them. This is seen in examining a sheet of paper before the light, a greater opacity being found on both sides of each brass wire than towards the midst of the space. This thickness is occasioned by the pulp, which the motion of the mould could not distribute, being stopped by the small wires, and still more by the large cross-wires. This defect is completely remedied by the improvement of weaving the wire of the mould like cloth. The traces of the old wires are most evidently perceived on the side of the sheet which was attached to the mould, and on the other side they form an assemblage of rounded risings. In the paper which is most highly finished, the regularity of these impressions is still visible; therefore it is evident, that all the operations to which it is submitted, have chiefly in view to soften these impressions without destroying them; it is necessary, therefore, to attend to the combination of labour which operates on these impressions. The coucher, in turning the mould on the felt, flattens a little the rounded eminences, which are in relief on one of the surfaces, and occasions, at the same time, the hollow places made by the wire-cloth to be partly filled up; meanwhile the effort which is made in detaching the paper, produces an indefinite number of small hairs on every protuberant part of the sheet. Under the action of the press, first with felts, and then without them, the perfecting of the grain of paper still goes on. The vestiges of the protuberances made by the wires of the mould are altogether flattened, and in consequence the hollows opposite them disappear also, but the traces formed by the intersections of the wire, in consequence of their thickness, appear on both sides, and are rounded by the press.

The grain of the paper is often disfigured by the *felts* when they are too much used, or when the wool does not cover the thread. In this case, when the paper is submitted to the press, it takes the additional traces of the warp and woof, and composes a surface extremely irregular. The two sides of the felt are differently raised, and that on which the hair is longest is applied to the sheets which are laid down; and any alteration of this disposition would produce a change in the texture of the paper. The stuff of which the felts are made should be sufficiently strong, in order that it may be stretched exactly on the sheets, without falling into folds, and at the same time sufficiently pliant to yield in any direction, without injury to the wet paper. As the felts have to resist the reiterated efforts of the press, it appears necessary that the warp be made strong, of combed wool, and well twisted. On the other hand, as they have to imbibe a certain quantity of water, and to retain it, it is necessary that the woof be of carded wool, and drawn out into a slack thread.

The paper remains in the *vat-press* during the time that the next post of paper is preparing; and, when it is removed to make room for that, the business of the third workman, called the *lifter*, begins: he is to take the sheets off the felt, (for they are caused to adhere to them by the action of the press,) and then make the sheets up into a second pile; but, if the coucher works too fast, and the lifter finds himself hard pressed, he cannot stretch out his sheets exactly upon one another, so as to make a neat and compact pile, which is very necessary to make paper of a regular and equal thickness, when put under a second or *wet-press*, which is done as soon as several of the piles are completed, and can be collected together. This second pressure, being made with all the sheets in contact with each other, expresses a great quantity of water from the paper,

and gives the sheet a very considerable strength; it also tends to take out those freckles on the surface of the sheets, which were occasioned by the impresson of the felt, though it is necessary to have felts in the first pressure, because the paper is then so soft and pulpy, that it would be pressed into a solid mass if the sheets touched each other. The paper remains in the second press as long as it can, until another pile is made ready by the lifter. When the paper has undergone these operations, it is not only softened in the surface, but better felted, and rendered more pliant in the interior parts of the stuff. In short, a great part of the water which it had imbibed in the operation of the vat is dissipated.

When the paper is removed from the second press, it is taken to the drying-locks, which are very extensive apartments, usually the upper parts of all the buildings of the mill: the sides are formed by luffer-boards, which are a kind of lattice or boarding that can be opened or shut, to admit more or less air, at pleasure. The sheets are taken up upon a piece of wood like a T, and hung upon hair lines, stretched across large horizontal wooden frames, called *tribles*; and these, as they are filled, are lifted up between upright posts to the top of the room, and retained by pegs put in the posts; then another frame, being filled, is put up in its turn, and so on till the loft is filled from top to bottom.

The principal care in drying the paper, consists in gradually admitting the external air, and in preventing the cords from imbibing moisture; for this purpose the lattices or luffer-boards should be constructed with great exactness, and the cords may be prevented from imbibing the water by covering them with wax. In using such cords, the moisture does not continue in the line of contact between the paper and the cord, which prevents the sheet from stretching in that particular place by its weight, and from the folds which the moisture in the subsequent operations might occasion. The cords are of considerable thickness, by which means they diminish the point of contact, and give a better and more equal circulation to the air. By these precautions, the Dutch paper is dried equally, and is extremely supple before the sizing. The time necessary for drying the paper depends so much upon the state of the atmosphere, and the thickness of the sheets, that it cannot be stated with any degree of accuracy. When dried, it is taken down, and sleeked, dressed, and shaken, to make the dust fall out, and to separate the pages from one another. It is then laid in heaps in the warehouse, and from thence brought out in order to be sized.

The *size* for paper is made of the shreds and parings got from tanners, curriers, and parchment-makers. All the putrified parts, and the lime, are carefully separated from them, and they are inclosed in a kind of basket, and let down by a rope and pulley into the cauldron. This is a late invention, and serves two valuable purposes: it makes it easy to draw out the pieces of leather when the size is extracted from them by boiling; and easy to return them into the boiler, if the operation is not complete. When the glutinous substance is sufficiently extracted, it is allowed to settle for some time; and it is twice filtered before it is put into the vessel in which they dip the paper. Immediately before the operation, a certain quantity of alum is added to the size. The workman takes a handful of the sheets, smoothed and rendered as supple as possible, in his left hand, dips them into the vessel, and holds them separate with his right hand, that they may equally imbibe the size. After holding them above the vessel for a space of time, he seizes on the other side with his right hand, and again dips them into the vessel. When he has finished ten or a dozen of these handfuls, they are submitted to the action of the press. The superfluous size is carried back to the vessel by means of a small pipe. The vessel in which the paper is sized is made of copper, and furnished with a grate, to give the size, when necessary, a due temperature; and a piece of thin board or

felt is placed between every handful of sheets, as they are laid on the table of the press.

It is necessary to make the size of considerable strength for drawing and all kinds of writing papers, and, while the operation is performing to have the size kept in as warm a state as the sizer can well bear his hands in it. And before to give it a proper time, to let it be well soaked before it is put into the press, or it will be *size-stained*; which will be the case also if, after being sized, pressed, and pasted, you hang it up to dry before it is cooled. It should stand in a heap, after it is parted sheet by sheet, and pressed, until the next morning, before it is hung up to dry. Hang from two to five sheets in each spur, according to the substance of the paper. If you size when there is a very drying wind in the summer, or a frosty and sharp air in the winter, it will injure and often destroy the size.

The state which paper is in when it should be sized is called the *water-leaf*; each spur having three or four sheets adhering together; and by no means in single sheets, or a loose state (as directed in all the publications we have seen), as it would make almost all the paper broken.

After the paper is sized and taken out of the sizing-press, let it be well covered up in the heap with cloths to keep it warm until it is parted sheet by sheet by women; after which it should be pressed again just hard enough for the size barely to stand on the edges of the paper like drops of dew when pressed; and it is then pressed enough in that state, and may be left to stand in the press an hour or two, when it will be in a fit state to hang up to dry, as above. But it should be observed, as to paper hung up after it is sized, that, if cold sharp air or very drying wind occurs in the spring or summer, cloths should be hung inside the shutters of the drying-house to be drawn close when the paper is first hung up, and for ten or twelve hours after.

III. FINISHING OF PAPER.—After the paper has been sufficiently dried for the last time, it is carried to the building where it is examined, finished, and pressed: this is called the *Sol*. Women are here employed to remove all damaged and imperfect sheets: it is then put into the *dry-press*, and squeezed with a most immense force, to render the paper flat, and give it a good surface. The lever of this press is fifteen or eighteen feet long, and ten or twenty people are employed at the last to work it; though they sometimes use *Sampson*, that is, a windlass like a crane, with which they purchase the lever of the screw; but this excessive labour is altogether avoided, and a much greater pressure given, by using Mr. Bramah's ingenious hydrostatic press, instead of the screw-presses, which consume a great portion of the power in friction. For a description of this, see the article *MECHANICS*, vol. xiv. p. 761.

The dry-press, of whatever form, is generally made large enough to hold two packs of ordinary paper at once, placed side by side. When the compression is judged sufficient, the heaps of paper are carried back to the table, and *parted*, that is, the whole turned, sheet by sheet, in such a manner that the surface of every sheet is exposed to a new one; and in this situation they are again brought to the press. It is in extending these two operations sometimes to four or five times, or as often as the nature of the paper requires, that the perfection of the paper consists. If the stuff is fine, or the paper slender, the parting is less frequently repeated. In this operation it is necessary to alter the situation of the heaps with regard to one another every time they are put under the press; and also, as the heaps are highest towards the middle, to place small pieces of felt at the extremities, in order to bring every part of them under an equal pressure. A single man, with four or five presses, may part all the paper produced by two vats, provided the previous pressing is well performed. The work of the parting generally lasts about two days, on a given quantity of paper.

The paper is now *sorted* into different lots, according

to its quality and faults, after which it is made up into quires. The person who does this must possess great skill, and be capable of attention, because he acts as a check on those who separate the paper into different lots. He takes the sheets with the right hand, folds them, examines them, lays them over his left arm till he has the number requisite for a quire, then brings the sides parallel to one another, and places them in heaps under the table. An expert workman, if proper care has been taken in assorting the lots, will finish in this manner 6000 quires in a day. The paper is afterwards collected into reams of 20 quires each, and for the last time put under the press, where it is continued for ten or twelve hours, or as long as the demand of the paper-mill permits.

More recent Improvements.—The operation of moulding the sheets of paper has, for some years past, been performed by a patent-machine which produces it an *endless and continued sheet*, instead of moulding them separately one by one; and this it does with such accuracy and dispatch, that many paper-makers have procured machines, notwithstanding the great expense of erection, and the premium which they are obliged to pay the patentees for working them. The first idea of this curious machine was brought from France by Monsr. Didot; but it was perfected here by our countryman Mr. Donkin; and we think it one of the most important inventions, as applied to the manufactory of paper, which has been produced since the fourteenth century, when the method of making paper from linen rags was first discovered. Messrs. Henry and Sealy Fourdrinier, and John Gamble, were the proprietors of this invention, for which they obtained several patents during its progressive stages of improvement; but an act of parliament was passed in 1807, to extend the usual term of all these patents to fifteen years from that period; and they then enrolled a specification in the records of Chancery, detailing the machine in its most improved state. But they have since parted with their property in the invention; and the machine originally built by Messrs. Fourdrinier and Co. now belongs to Mr. Nicholls, in whom the patent has been vested. It is situated at Two Waters, a village in Hertfordshire, two miles south-south-west from Hemel Hempstead, at the union of the river Gade with Bulborne-brook, and adjoining the Grand Junction Canal. By this machine, and appendant apparatus, every part of the process is conducted without the intervention of manual labour; and it cannot fail of exciting surprise in the spectator, on beholding the rag first washed; then beaten or reduced to pulp; and, lastly, conducted through pipes to the reservoir of the machine, which constantly feeds itself, and, in a very few seconds, produces a paper so perfect in all its parts, that it is wound off upon a reel, exactly like a web of cloth. The paper thus manufactured is superior in quality, firmer in texture, and more parallel, than any ever made by hand: the machine is capable of working up half a ton of rags in one-day, and of making the whole, if required, into a single sheet of paper! Indeed a single sheet of paper has been made of seven hundred and fifty yards in length, without one pin-hole or break, and of a texture resembling in fineness the spider's web. But we shall give a more detailed and satisfactory description of the process from the patent itself.

The pulp, having been brought, in the usual manner, to due consistence, by the admixture of water, kept in motion in the vat by means of what are denominated *hogs*, is let out through several circular apertures in front of the vat, which can be narrowed or widened at pleasure, by means of a sliding plate. These apertures admit the pulp into a trough, which has a low side, or lip, and over the edge of this it flows, in a continued cascade, or even sheet: this trough of the vat is placed at one end of the machine, so that the stream of pulp falls upon a wire-cloth, or web, of many yards in length, the ends of which being united together, it is extended horizontally, in the manner of a jack-towel, over two rollers, one of them

placed close under the lip or mouth of the vat, so that the stream of pulp descends as little as possible. The wire is also supported by several other parallel rollers, that it may not hang down or bag, but be kept as level as possible, and by a very ingenious contrivance is kept extended in breadth to a proper tension; it therefore represents a table of several yards in length, which, by the revolution of the rollers, is kept in continual motion from the vat towards the end of the machine. The pulp is kept within bounds upon this table, according to the width intended to be given to the paper, by two pieces or rulers of wood, exactly parallel with each other, and also with the line of motion of the wire. Between the wire itself and these rulers are placed two endless straps of leather, as wide as the rulers, and revolving with the same velocity as the wire, but over different rollers. Similar rulers, and endless straps, are also placed in contact with the lower surface of the wire, so that the wire is confined between them on each side, and the liquid pulp thus prevented from running off on the sides, and they act as decks to the mould. As they move together, they occasion no friction to destroy the wire. Near that part of the wire upon which the pulp falls from the lip in the vat, there is placed a flap of oiled silk, or other material, to prevent the pulp from running back towards the vat over the roller of the wire.

As the wire revolves upon its rollers, and carries the pulp along upon its surface from the vat to the other extremity, it is conducted between two rollers, fitted up in the manner of a rolling-mill, which cause a pressure upon the pulp and paper to force out the water, and are therefore called the *wet-press*. In order to guard the pulp, which before passing between the rollers is in a soft state, from being dislodged, or otherwise injured, by the upper roller coming immediately in contact with it, a revolving endless web of felt is applied. This is made of the same width as the endless wire, but not so long, and it is extended, like that, upon rollers situated above the wires; it is likewise brought between the rollers of the wet-press, so that its under surface falls upon the surface of the pulp, or paper, and defends it from the action of the upper cylinder: the wire and the felt are thus brought into contact with the paper between them, and the required pressure is given by means of screws, which increase or diminish the distance of the large compressing rollers; and these, being covered with flannel cloth, or felt, are prevented from injuring the wire-webbing, as well as producing a better effect upon the paper than naked cylinders would do.

To prevent the water thus pressed out of the pulp from running back upon the paper, the wire is not only made to descend before it passes the wet-press, but there is also placed a small roller resting upon the wire, as near the press as possible; and some part of the water is previously got rid of, by both the wire and felt, with the pulp between them, passing through a small pair of rollers, to the axis of the upper of which rollers are hung weights, in order to give a slight pressure. The water that drains from the pulp is collected into a trough, and returned to the vat by means of a scoop-wheel instead of a pump, which might form the paper-stuff into lumps or rolls, by the mutual friction or rubbing of any parts of the apparatus against each other; and the reason for returning the water into the vat, is to prevent the loss of a considerable portion of the paper, stuff, blue, size, &c. which would otherwise be sustained by its running to waste.

It is evident then, that, if motion is given in the proper direction to the wet-press cylinders, having both the web and wire thus compressed between them, they will be drawn along by them, and caused to revolve upon their respective rollers; and that, as long as these webs continue so to revolve, and the pulp continues supplied and running upon the surface of the under web, so long will the machine continue making a sheet of paper of continually increasing length. But as the paper, even after

having passed between the rollers of the wet-press, is not of that consistency and strength as would allow of its being removed from the machine and cut in sheets, the new-made paper is caused to detach itself from the wire, at the moment it comes to the extreme roller, over which the wire revolves, and is immediately received upon a second web of felt, which is, like the former, stretched by two principal rollers and other subordinate ones. By the revolution of this web, which must have the same velocity as the former, the paper is brought between two rollers of brass or other hard metal, which are turned perfectly smooth, and placed some distance from the wet-press cylinders, but exactly parallel to them; and, after passing through them, the paper is received and wound upon a reel, or roller, which is from time to time removed, and others applied in their room as they are filled with paper.

This is the general action of the machine; but there are a number of very ingenious movements, which we have not mentioned. The *shaking-movement* of the mould, which is so necessary to make the pulp coagulate into paper, is, in this machine, given to the wire thus: the frame of the roller on which the wire is extended at the end near the vat, is so placed on the top of upright legs, which are movable on centres, as to admit the roller and wire with the deckle-traps to move sideways a small quantity, and to return, in the manner of vibration, by the action of a crank. The number of these vibrations, or shakes, necessary in a given time, and the space passed through by the wire in each, will vary according to the quality and preparation of the pulp. The number, however, seems, by observation, to be limited to one or two hundred per minute; and the space, between a quarter of an inch and an inch. To enable the paper-maker readily to give a proper velocity to the crank according to his judgment, the same is turned by a small independent water-wheel, the velocity of which, and consequent number of vibrations, are regulated, at pleasure, by the quantity of water admitted upon the wheel. The sliding-plate in the vat, which admits the pulp to flow out as first mentioned, is regulated by a screw, by which the circular aperture may be opened or shut in any intermediate degree, so that the quantity of pulp required to run from the vat to the wire, may by this be regulated, and so adjusted to the velocity of the wire, as to produce a sheet of paper of any required thickness. The whole machine is turned by a water-wheel, which is preferable to any other power, as by it is obtained the most regular and uniform motion, and such as is best adapted for this purpose, though other first-movers might be used.

As the paper is drawn off the endless wire by the motion of the revolving web of felt, it is necessary to have the riggers, or band-wheels, which communicate the motion from the rollers of the dry-press to those of the wet-press, made upon an adjustable principle, or capable of having their diameters increased or diminished, as occasion requires, whilst the machine is at work. By this adjustment, an exact correspondence is obtained between the velocity of the revolving wire and that of the revolving felting; for, should one exceed the other in the smallest possible degree, the paper would either be torn asunder, or carried round upon the under side of the web, and be spoiled. It is effected by a very ingenious application of an expanding rigger.

The machine will make paper of any required *width* also, by diminishing the distance between the deckles upon the wire; and for this purpose, the rollers over which the deckle-traps are constructed are adjustable upon their spindles. The long sheet of paper, thus obtained, is unrolled from the reel upon a cutting-table, having grooves, with steel edges, placed at a proper distance; and thus the sheets, of the usual sizes, are cut off, by means of steel cutting-wheels running into the grooves of the table, and pressed down by a loaded carriage. The reel of paper is placed parallel to these grooves, which are

so much longer than the utmost width of the sheet, as is sufficient to let the carriage be retained on either side while a sheet is taken off the table, and fresh paper drawn on; in doing which, care is taken to keep the edges of the sheet at right angles to the grooves, for which purpose, direction-lines are drawn upon the table. We have been informed by those who have seen these machines at work, that this method of cutting has been abandoned; and they are now worked with reels made adjustable to the required width of the sheet, and, when a sufficient quantity is wound on it, is cut off by a knife, which, by cutting through the folds, divides the paper into separate sheets, which are ready for the operation of the second press. The machines are constructed with a cloth, so wide, that the continual sheet is cut up into two, and sometimes three, in width, by which means it produces an immense number of sheets in a short time; but the greatest advantage is in making very large sheets, which it will do to almost any extent in length, and as much as two yards in width.

But even this curious machine has been greatly improved upon by Messrs. Dickinson and Co. whose mills are situated a little lower down, between the villages of Two Waters and King's Langley. They have an air-pump, which acts on the machine in such a manner as to supersede the *shake* there described as so necessary; and, instead of the wire several yards in length whereon the pulp is described as running, it runs into a cylinder, and from thence on to the felt; which reduces the size of the machine so much that it occupies but little more room than a mangle, while the others take up a space of ten or twelve yards in length. Many other improvements are made in these machines, (which we cannot fully explain, as no description of them is published, and we have only the imperfect observation of a person who had the pleasure of seeing them;) one of which is, the original machines require the eye of some person constantly on the paper in its progress, lest it should break or become thin and uneven; but these have a small bell so fixed, that the least imperfection causes it to ring; therefore the man whose duty it is to attend the machine can be employed in cutting the paper from the roller at the same time. Mr. G. Dickinson, we believe, obtained a patent for a picking-machine, which was fixed so as to pick the paper while in its progress to the roller at the end of the machine; but, since that, Mr. Dickinson has invented a new method of cleansing the pulp itself, by bringing it through a body of water; which method produces a paper much cleaner and better than can otherwise be produced, and effects a very material saving of labour and materials.

The paper is now ready for the market. Not quite so; for, previous to its quitting the mill, or warehouse, the proprietors must pay the

DUTIES ON PAPER.—The principal act by which the excise-duties on paper are now collected, is the 43 Geo. III. c. 69. By the 43 Geo. III. c. 81. more duties were added to those imposed by the former act; and by other subsequent statutes other duties increase the whole amount; and the particulars may be found in the schedules annexed to the several acts. We shall here subjoin some more permanent regulations.

Paper which hath paid the duty may be exported, and also books; and drawbacks are to be allowed subject to the regulations prescribed in several acts; as 26 Geo. III. c. 78. 34 Geo. III. c. 20. 43 Geo. III. c. 69. sched. G. The officer attending the packing of paper for exportation, shall take off the stamps from each ream or bundle; and any person obstructing him in this service shall incur a forfeiture of 50l. (26 Geo. III. c. 77.) By 49 Geo. III. c. 98. certain importation-duties of customs are also payable upon papers; but old rags, old ropes or junks, or old fishing-nets, may be imported duty free, (11 Geo. I. c. 7.) By 32 Geo. III. c. 54. officers of the customs shall cause any printed, painted, or stained, paper, that is imported, to be marked; and counterfeiting or forging the mark

mark or number, subjects to a forfeiture of 100l. and counterfeiting or forging any stamp or seal for making the impression, incurs a forfeiture of 500l. and any person who shall sell paper with such counterfeit stamp, knowing the same, shall forfeit 50l. By 34 Geo. III. c. 20. the importation of books for sale, first printed in this kingdom, and reprinted in any other, incurs forfeiture of the same, and also 10l. and double the value of such book; provided this shall not extend to any book that has not been printed or reprinted in this kingdom within twenty years before the same shall be imported, &c.

Every maker of paper or pasteboard, and every paper-stainer, shall take out a license from the office of excise, annually, for which he shall pay 2l. on pain of forfeiting 20l. (24 Geo. III. c. 41. 43 Geo. III. c. 69. sched. A.) All brown paper, made of old ropes or cordage only, without separating or extracting the pitch or tar from them, and without any mixture of other materials, shall be deemed paper of the *second class* or denomination, and be chargeable with the duty accordingly; and all other paper whatever (glazed paper for clothiers and hot-pressers excepted) shall be deemed to be of the *first class* or denomination. (42 Geo. III. c. 94.) No paper shall be painted or stained for hanging, except that for which the duty on paper of the first class hath been charged, duly stamped, &c. (41 Geo. III. c. 8.) Nor is the maker to diminish any paper before it be charged, under the penalty of 50l. and also such paper. Pasteboard is to be made of paper charged, and unused for any other purpose, on pain of 100l. together with forfeiture of the same, and utensils, &c. employed in making it. (42 Geo. III. c. 94.) By the same act, the maker of pasteboard shall produce to the officers all such paper as he intends to use for pasteboard, duly wrapped and stamped, after twenty-four hours' previous notice, on pain of 100l. nor shall any maker of pasteboard be a paper-maker, nor manufacture within a quarter of a mile of a paper-manufactory, on pain of 100l. Places of making or keeping paper, pasteboard, mill-board, scale-board, or glazed paper, all utensils and materials employed, shall be entered, on pain of forfeiture, and also of 50l. (34 Geo. III. c. 20.) All paper shall be made up into quires, each quire consisting of 24 sheets, and such quires shall be made up into reams of 20 quires each; and all pasteboard, &c. shall be made up in parcels, each parcel containing even dozens of sheets, of one and the same denomination, and of equal dimensions, and not less than 24, nor more than 72, such sheets in every parcel; tied up, &c. in wrappers, and marked with the class of paper to which it belongs, the number of the reams made by the maker during the current quarter, &c. &c. on penalty of 200l. and forfeiture. (42 Geo. III. c. 94.) Every maker may make his paper into quires without folding, provided that such quires, when made up into reams, be separated by a slip of coloured paper placed between each quire, and visible on the outside of the ream, and that the outside quires of each ream consist of not less than 20, nor more than 24, sheets, at the option of the maker. Every maker, whose mill or work-house is situated in any city or market-town, who shall have any paper, pasteboard, &c. to be weighed, and charged with the duty, shall give 24 hours (elsewhere 48 hours) previous notice, in writing, to the officer of excise, who shall attend; and such maker, or his servant, shall produce to the officer all such paper, pasteboard, &c. duly tied up, that the duty may be charged previous to removal; stamps shall be provided by the commissioners of excise; and, if any person shall counterfeit such stamps, and sell with such counterfeits, knowingly, he shall be adjudged guilty of felony, and subjected to transportation, as a felon, for seven years. 47 Geo. III. sess. 2. c. 30.

Paper-makers are enjoined to give notice to the proper officers of their names, places of abode, store-houses, &c. and to make regular daily entries of the number of sheets made by them, which entries are to be sworn to every six weeks, on penalty of 50l. and the duty shall be

paid in six weeks after entry, on pain of double duty. 34 Geo. III. c. 20.

Paper-makers are forbid to remove or to conceal their paper, &c. till the officer has taken account thereof, on penalty of 50l. and forfeiture of the paper, &c. (24 Geo. III. c. 18. 34 Geo. III. c. 20. 42 Geo. III. c. 94.) nor shall the paper, &c. be removed in less than 24 hours after charged, under the same penalty. Any paper may be removed from one mill to another, upon giving 48 hours notice, in writing, to the officer. Paper that has been stamped and charged, is to be kept separate from other paper, and also paper of one class from that of another, on pain of 50l.

Persons molesting officers in the execution of this act (34 Geo. III. c. 20.) incur a penalty of 100l. and the penalties and forfeitures shall be appropriated, one moiety to the king, and the other moiety to the informer.

There is a drawback of the duties on paper exported; and also for books printed at Oxford or Cambridge, in the Latin, Greek, Oriental, or Northern, languages; and also for Bibles, Testaments, Psalm-books, or Books of Common Prayer, printed either in those universities, or by the king's printer, under certain conditions. 43 Geo. III. c. 69. sched. C.

Pasteboard, made of paper that hath paid the duty, shall not be charged with farther duty. (34 Geo. III. c. 20. 42 Geo. III. c. 94.) Allowance shall be made on paper damaged, for which the duty hath been paid; upon seven days' notice: and allowance shall be made to clothiers and hot-pressers; on certain conditions. 42 Geo. III. c. 94. 43 Geo. III. c. 69.

Stained paper (besides the duty paid for the paper before staining) is subject, by the former acts, to a duty of 1 $\frac{1}{4}$ d. a yard square. 43 Geo. III. c. 69.

Of the different Kinds of Paper; and the Methods of preparing it for various Purposes.

Papers are of various kinds. With regard to colour, they may be divided into white, blue, brown, &c. With regard to quality, into superfine, fine, second, bastard, &c. With regard to use, into writing, printing, pressing, cap, cartridge, copy, chancery, post, &c. With regard to dimensions, into pot, foolscap, crown, demy, medium, royal, super-royal, imperial, elephant, atlas, &c.

Pot is the name of the smallest kind of paper: it was so called from having had originally the device of a flower-pot for the water-mark. At present the water-mark in most kinds of paper is the maker's name with the date of the year.—*Post*, large or small, is chiefly used or intended for writing letters to go by the post.—*Demy* is that most commonly used for printing books, though the other larger sorts are occasionally employed for splendid works. The present Encyclopædia is printed upon *medium* paper.

BLOTTING-PAPER is paper not sized, and in which therefore ink readily sinks or spreads. It is used in books of account, &c. in lieu of sand, to prevent blotting and disfiguring the opposite page. The same kind is likewise used by apothecaries in filtering juices, and other matters.

DRAWING-PAPER. The paper used for drawing, or for coloured maps, is in some mills made from one kind of white stuff, either fine or middling; in others from a mixture of three or four kinds of stuff of different colours. The Dutch were, not long ago, almost wholly in possession of this manufacture. The same qualities are necessary in this paper as in that for writing: the grain, however, must be a little more raised, although softened by the exchange; for, without this grain, the pencil would leave with difficulty the traces of the objects. Great care is also necessary in the sizing of this paper, that the drawing be neatly performed, and also that the sinking of the ink or colours into the irregularities of the stuff be prevented.

Painters prepare their paper for drawing, and give it a dark ground, which spares them much labour of the pencil.

cil afterwards in those places where shade is necessary. For this purpose they take white paper, and pass over it a sponge which has imbibed water impregnated with soot, leaving the light places to be formed afterwards. This is called *bistered paper*. They use also a kind of paper for drawing, which is called *trinted paper*. A light colour is passed over the whole ground, which deprives the paper of its original brightness, and makes the light places of the print appear more in relief, and more luminous.

Tracing-paper.—The method most common and most convenient for copying a print is to use oiled paper. The manner of preparing this paper is to take that which is thin and smooth, known commonly by the name of *serpent-paper*, and moisten it with a composition, two parts of the oil of walnuts and one part of the oil of turpentine mixed well together. A sheet of pasteboard and a sheet of paper are laid on a smooth table; above them are placed two sheets of paper to be prepared; and a layer of the oil applied to the uppermost is sufficient to penetrate both. This may be done to any number of sheets, and a strong sheet of pasteboard is placed over the whole. The heap is afterwards submitted to the press, under which it remains for two or three days, till the oil is completely dry. Paper prepared in this manner serves to copy very readily and exactly all kinds of figures and plans; because, being altogether transparent, all the parts of the drawing, whether of light or shade, are easily distinguished through it.

In the year 1812, the Society of Arts voted a premium to Mr. Cathery, of Mead-row, Lambeth, for the invention of a tracing-paper for engravers and painters, of which the following is the method of preparation: Take one quart of the best rectified spirits of turpentine, and put to it a quarter of an ounce of sugar of lead finely powdered; shake it up, and let it stand a day and night; then pour it off, and add to it one pound of the best Canada balsam; set it in a gentle sand-heat, and keep stirring it till it is quite mixed, when it will be fit for use. Then lay your paper on a smooth board, and, with a large brush, brush your paper over very even with the mixture, and then hang it upon lines to dry; and it will be fit for use in about four days.

This paper, says Mr. Cathery, "will be of great use to engravers, as it will not turn yellow, as the tracing-paper now in general use is apt to do; which takes off the transparency and prevents the artist from seeing the drawing or painting that is under it so plain as he could wish, particularly if the drawing or painting is very delicate, or of a yellowish colour. It is very transparent; and, as the pencil will mark better on this than it will on the yellow paper, it will be the better for those that trace on the ground that is laid on the copper by means of a point and a coloured paper under it, as they will see the tracing plainer; and, if laid on the copper-plate that has a ground on it, and passed through a printing-press, the marks of the pencil will adhere quite perfect to the ground; and, as the tracing-paper is dry, it will not stick to the ground, and tear it up, as the other paper will sometimes, on account of its being fresh made; for, if kept long, it will turn yellow and thick. The longer my paper is made the better it is, and keeps clear and white. I can make and sell it at the same price as the paper which is now made. You may trace or write with a pen and ink on it, if the ink has a little ox-gall put into it." The same gentleman received a premium of twenty guineas the year preceding, for his method of fixing black and white chalk drawings.

MARbled PAPER is a sort of paper variously stained, or painted as it were with divers colours; made by applying a sheet on the surface of a liquor wherein colours diluted with oil or ox-gall are suspended.

The manner of making it is thus: A trough is provided of the shape and dimensions of a sheet of the paper to be marbled, and about four fingers deep; this is made

of lead or wood well joined, and pitched or primed to contain the liquor. For the liquor, a quarter of a pound of gum tragacanth is macerated four or five days in fair water; this they stir from time to time, and add to it daily fresh water, till it be of a consistency somewhat thinner than oil; then they strain it into the trough.

The colours to be applied are—For blue, indigo ground up with white lead, or Prussian blue and verditer may be used. For green, indigo and orpiment, the one ground and the other tempered, mixed and boiled together with common water; or verdigris, a mixture of Dutch pink and Prussian blue, or verditer, in different proportions. For yellow, orpiment bruised and tempered; or Dutch pink and yellow ochre. For red, the finest lake, ground with raspings of Brasil wood, which has been prepared by boiling half a day; or carmine, rose-pink, vermilion, and red-lead; the two latter of which should be mixed with rose-pink or lake, to bring them to a softer cast. For orange, orange-lake, or a mixture of vermilion, or red-lead, with Dutch pink. For purple, rose-pink and Prussian blue. Into all these colours, properly ground with spirit of wine, they put a little ox or fish gall, which is two or three days old; and, if the colours dilate not of themselves sufficiently, they add more gall; on the contrary, if they spread too much, the gall is over-dosed, and must be corrected by adding more of the colour without gall.

For the operation of *marbling*, when the gum is well settled in the trough, they extend a sheet of paper and plunge it very shallow into the liquor, suddenly lifting it out again, in order to stir up and raise the subsiding gum towards the surface, and for the more universal impregnating of the liquor. This done, and all the colours ranged in gallipots on the table, where also the trough is placed, they begin by dipping a brush of hog's hair into any colour, commonly the blue first, and sprinkle it on the surface of the liquor: if the colour has been rightly prepared, it will dilate itself duly therein. This done, the red is applied in the like manner, but with another pencil: after this the yellow: lastly the green. For white, it is made by only sprinkling fair water mixed with ox-gall over the liquor. When all the colours are thus floating on the liquor, to give them that agreeable cambletting which we admire in marble paper, they use a pointed stick; which, being applied by drawing it from one side of the trough to the other, with address, stirs up the liquor and fluctuating colours; then with a comb, made of wood, about five inches long, with brass teeth, about two inches in length, and a quarter of an inch distant from each other, taken by the head with both hands, they comb the surface of the liquor in the trough, from one extreme to another, permitting only the teeth to enter: this, being performed with a gentle and uniform motion, makes those clouds and undulations on which the beauty of the paper depends.

If it be farther desired to have the colours lie in any other fantastical posture, representing serpents, or the like, it is effected with the pointed stick above mentioned, by drawing it over what has been already combed; but this must be done with a dextrous hand, and with a shallow dip into the liquor, circling, as if you would draw some flourish, or figured letter.

Lastly, the colours being in this posture, the operator displays and applies on them a sheet of white moistened paper; to do which, artist-like, requires a sleight only to be obtained by practice; because the surfaces of the liquor and the paper are to meet equally in all parts; which done, before the colours have time to soak through, which, unless the paper be very thick, will be in the space of two or three pulses, he lifts up the paper nimbly, and with an even hand; and then, after spreading it awhile on a board, hangs it on a line to dry; which, when sufficiently done, they first rub it with a little soap, and then polish it with a marble stone, ivory knob, or glass polishers, or with a burnisher of jasper or agate.

Some

Some attempts have been made to enrich the marbling, by mixing gold and silver with the colours; which succeeded well in many attempts in the French king's library, though the expense has hindered the practice from obtaining.

PAPIER MACHÉ.—Mr. Boyle first observed, that paper, besides its common uses, may be made into frames for pictures, fine embossed work, and other parts of furniture; or into snuff-boxes, toys, &c. For this purpose, a convenient quantity of cuttings of white or brown paper may be steeped for two or three days in water, till it becomes very soft; then, reducing it by the mortar and hot water into a thin pulp, it is laid on a sieve to draw off its superfluous moisture; then, putting it into warm water wherein a considerable quantity of fresh glue or common size has been dissolved, it may afterwards be put into oiled moulds to acquire the designed figure; and, when taken out, may be strengthened, as occasion requires, with plaster, or moistened chalk; and, when dry, painted or overlaid with a mixture of size and lamp-black, and afterwards varnished.

These hints have since been improved into a regular manufacture, both in France and England, under the name of *papier maché*. The black varnish for these toys, according to Dr. Lewis, is prepared as follows: Some colophony, or turpentine boiled down till it becomes black and friable, is melted in a glazed earthen vessel, and thrice as much amber in fine powder sprinkled in by degrees, with the addition of a little spirit or oil of turpentine now and then: when the amber is melted, sprinkle in the same quantity of farcocolla, continuing to stir them, and to add more spirit of turpentine, till the whole becomes fluid; then strain out the clear through a coarse hair bag, pressing it gently between hot boards. This varnish, mixed with ivory black in fine powder, is applied, in a hot room, on the dried paper paste; which is then set in a gently-heated oven, next day in a hotter oven, and the third day in a very hot one, and let stand each time till the oven grows cold. The paste thus varnished is hard, durable, glossy; and bears liquors hot or cold.

PAPER HANGINGS.—There are various kinds of paper-hangings, of which some are made in the representation of stucco-work, for covering ceilings, or the sides of halls, stair-cases, passages, &c. and others in imitation of velvet, damask, brocades, chintzes, or such silks and stuffs as are employed for hanging rooms. The principal difference in the manufacture lies in the grounds; some of which are laid in varnish, and others in the common vehicles for water-colours. The kind of paper employed for this use is a sort of cartoon, manufactured for the purpose, which must be stamped before it is painted.

1. For common designs done with water only, the following are most proper: For red, lake, vermilion, rose-pink, and red-ochre: for blue, Prussian blue, verditer, and indigo: for yellow, the yellow-berry wash, Dutch pink, and yellow-ochre: for green, verdigris, or a mixture of the blue colours with the yellow colours, particularly with the yellow-berry wash: for orange, vermilion, or red lead, with Dutch pink: for purple, a wash made of logwood, or a mixture of the lake, or rose-pink, with deep-coloured Prussian blue, or with indigo: for black, ivory-black, and, in some nicer cases, lamp-black: for white, whiting; and for the heightenings, white-lead. Where great brightness is required, the lake should be used for the crimson red, and Prussian blue for the blue; but for many purposes, rose-pink used alone for the crimson red, and indigo mixed with whiting for the blue, will answer the purpose with much less expense. The lake, rose-pink, Prussian blue, and Dutch pink, intended for this use, should be procured in a moist state.

2. The colours used in varnish may be the same as those used in water; but for this purpose, those just mentioned should be obtained dry. As for the vehicles of the colours; when water is used, it must be inspissated with size and gum arabic, or Senegal. When burnish is used,

it must be formed of oil of turpentine, and the resins and gums which will dissolve in that menstruum.

With respect to the *grounds* for paper-hangings, those that are laid in water, are made by mixing whiting with the size above mentioned, and laying it on the paper, with a proper brush, in the most even manner. Nothing more is necessary, when the ground is to be left white; and the paper, being hung on a proper frame till it is dry, is fit to be painted. When coloured grounds are wanted, the same method must be pursued; and the ground of whiting first laid: except that, in paler colours, a second coating may sometimes be spared, by mixing some strong colour with the whiting. But, where a greater force of colour is wanted, the pigment or colouring substance must be tempered with the proper vehicle, and then spread over the white coat. The varnish-grounds are made much in the same manner, by mixing the proper colour with the varnish, and spreading it on the paper.

There are three methods by which paper-hangings are painted: the first by printing on the colours; the second by using the stencil; and the third by laying them on with a pencil, as in other kinds of painting.

1. When the colours are laid on by *printing*, the impression is made by wooden prints; which are cut in such manner, that the figure to be expressed is made to project from the surface, by cutting away all the other part. This, being charged with the colours tempered with their proper vehicle, by letting the print gently down on a block, on which the colour is previously spread, conveys it from thence to the ground of the paper, on which it is made to fall more forcibly by means of its weight, and the effort of the arm of the person who uses the print. The manner of doing this, when more particularly explained, is thus. The paper, being properly prepared by a ground of whiting, colour, or varnish, is laid on a block, on which a piece of leather is strained. The colour, mixed with its proper vehicle, is spread on another piece of leather, or oil-cloth, laid on a flat block, somewhat larger than the print; which is done by a boy or man who attends for that purpose; and, having the colour by him in a pot, spreads it with a brush on the block betwixt every stroke and impression the printer makes. The print is previously cut in such manner, correspondently to the design of the painting, that there shall be a projection on the surface answering to every part, where that colour intended to be conveyed by this print is necessary. The printer then takes the print either in his right hand, or, when too heavy to be so managed, in both, and drops it gently on the block, just charged with colour; from whence he again immediately raises it in the most perpendicular direction, and lets it fall, in the strongest though most even manner he can, on the paper; increasing the force by all the additional velocity he can give the print. When this is done, the sheet printed is immediately taken off the block, and hung up to dry; and, another being put in its place, the same operation is repeated, till the whole quantity of paper is printed. It is easy to conclude, that there must be as many separate prints as there are colours to be printed; and they are to be used successively in the same manner as the first. But, where there are more than one, great care must be taken, after the first, to let the print fall exactly in the same part of the paper as that which went before: otherwise the figure of the design would be brought into irregularity and confusion, for want of *register*, as letter-press printers call it. In common paper of low price, it is usual, therefore, to print only the outlines, and lay on the rest of the colours by stencilling; which both saves the expense of cutting more prints, and can be practised by common workmen, not requiring the great care and dexterity necessary to the using of prints.

2. The manner of *stencilling* the colours is this: The figure, which all the parts of any particular colour make in the design to be painted, is to be cut out, in a piece of

thin leather, or oil-cloth. These pieces of leather, or oil-cloth, are called stencils; and, being laid flat on the sheets of paper to be printed, spread on the table or floor, are to be rubbed over with the colour, properly tempered, by means of a large brush. The colour passing over the whole, is consequently spread on those parts of the paper where the cloth or leather is cut away, and give the same effect as if laid on by a print. This is nevertheless only practicable, without great care, in parts where there are only detached masses, or spots of colours; for, where there are small continued lines, or parts that run one into another, it is difficult to preserve the connection or continuity of the parts of the cloth, or to keep the smaller corners close down to the paper; and therefore, in such cases, prints are preferable. Stencilling is indeed a cheaper method of ridding coarse work than printing; but, without such extraordinary attention and trouble as render it equally difficult with printing, it is far less beautiful and exact in the effect. For the outline of the spots of colour want that sharpness and regularity that are given by prints; besides the frequent extralinations, or deviations from the just figure, which happen by the original misplacing of the stencils, or the shifting the place of them during the operation.

3. *Pencilling* is only used in the case of nicer work, such as the better imitations of the India paper. It is performed in the same manner as other paintings in water or varnish. It is sometimes used only to fill the outlines already formed by printing; where the price of the colour, or the exactness of the manner in which it is required to be laid on, render the stencilling or printing it less proper: at other times it is used for forming or delineating some parts of the design, where a spirit of freedom and variety, not to be had in printed outlines, are desired to be had in the work.

Flock Paper is a kind of paper-hanging, lately invented, which is embossed by means of chopped cloth. The paper designed for receiving the flock is generally first prepared with a varnish-ground of a proper colour; and it is not uncommon to print some mosaic, or other small running figure, in colours, on the ground, before the flock is laid on: this may be done with any pigment of the colour desired, tempered in varnish, and laid on by a print cut for the purpose.

The manner of laying on the flock is either by means of a print or by a stencil. But, as the stencil can execute nothing but detached parts, and consequently is unfit for all designs where running work, scrolls, or other more complicated ornaments, are introduced; it is extremely confined with respect to the nature of the designs for which it can be employed; and the print is therefore most generally preferred.

The method of laying on the flock by means of a print is this: A wooden print being cut in such manner, that the part of the design, which is intended for the flock, may project beyond the rest of the surface, the varnish is put on a block covered with leather, or oil-cloth, and the print is then used to lay the varnish on all the parts where the flock is to be fixed. The sheet, thus prepared by the varnished impression is now to be removed to another block or table; and to be strewed over with flock; which is afterwards to be gently compressed by a board, or some other flat body, to make the varnish take the better hold of it. Then the sheet is to be hung on a frame till the varnish is perfectly dry; at which time the superfluous part of the flock is to be brushed off by a soft camel's-hair brush, and the proper flock will be found to adhere in a very strong manner. When the stencil is used, the same method is to be pursued; the varnish for holding the flock being laid on by that instead of a print; the flock afterwards strewed upon it, as in the other case.

The usual method of preparing the flock is, by cutting woollen rags, or pieces of cloth, with the hand, by means of a large bill or chopping-knife. But it is much

more easily and better done by a machine; which may be worked by a horse-mill, at the same time such mill is employed for cutting diamonds, or any other similar purpose. In such case, the construction of that part of the machine, which is made for the cutting the flock, is this: A box is made for containing the rags or cloth to be cut, which is open at the top, and of such size as may best suit the quantity of rags that the force employed can cut. A blade is also to be made, the length of which is to be equal to the breadth of the box; and it should be strong, and must be charged with as great a weight as the force employed can be made to raise with a quick motion. The box, being filled with the rags or cloth to be cut, is placed under the blade, and made to move by hitches after the stroke of the blade is given, just so far as where it is proper the blade should again cut the cloth or rags; while at the same time, the blade is lifted up, and let fall on the cloth, which it cuts through, till by successive strokes, and the progressive motion of the box under it, the whole quantity of cloth or rags in the box has been cut. The box must then be turned, so that one of the sides may become the front; and the operation must be repeated; by which means the cloth or rags, having been cut both ways, will be reduced to the state in which the matter is called flock; and fit to be employed for the purpose of paper-hangings.

There is a kind of counterfeit flock-paper, which, when well managed, has very much the same effect to the eye as the real, though done with less expense. The manner of making this sort is, by laying a ground of varnish on the paper; and, having afterwards printed the design of the flock in varnish, in the same manner as for true, instead of the flock, some pigment or dry colour, of the same hue with the flock required by the design, but somewhat of a darker shade, being well powdered, is strewed upon the printed varnish, and produces nearly the same appearance.

PAPER-ROOFS.—In some parts of Devonshire, though slate is by no means difficult to be procured, a substitute for that sort of covering is getting very much into use, which is prepared in the following manner: Three parts of whiting, five of sand, one of pounded charcoal, and one of bone-ashes, to a barrel of common tar, to which are added four pounds of black resin; the two last materials are to be melted together, and, when boiling, the other ingredients are to be added in small quantities, keeping them constantly stirred and in motion over the fire, until the whole mass becomes of a consistence fit for use. Then the roof, being previously covered over with sheathing-paper securely nailed down, is to be carefully and evenly spread with the liquid hot from the copper, to the thickness of about three quarters of an inch; which will cost, at the cauldron, about thirty-five shillings for each square of ten feet. The same measure of the common slate-roof will cost about thirty-two shillings. The roofs for this sort of composition are pitched very flat, and, from the lightness of the scantling which is necessary in their construction, come considerably cheaper than those required for carrying slate or tiles.

Mr. Loudon, whose great improvements in farm-buildings have made his name celebrated, has published a more detailed account of this kind of roof, particularly as used by himself at Tew-lodge in Oxfordshire. These roofs, as noticed above, are very flat, being raised no higher than what is sufficient for throwing off the water; Mr. L. allows two inches and a half of rise for every foot of base. The thickness of the timber for the couples depends on the sort employed, and the width of the house. Where deal is used, one inch and a half will be sufficient for the depth and width of a rafter of twenty feet. Of other sorts of wood the proportion must be different. The rafters, if of deal, may be made two inches square; if of other wood, proportionally stronger. They are placed about eighteen inches apart, and are nailed to the couples.

The

The thin boards for receiving the paper, if of deal, one-quarter or five-eighths of an inch is sufficient thickness; Scotch fir may be half an inch. These boards are made tolerably straight at the edges, and nailed on, not as boards for slates, in a horizontal direction, but in a direction from the eaves to the ridge of the roof, across the rafters. The advantage of this mode is, that, in case of warping, they are not liable to retain the water. They should project an inch over the lower or cornice rafter. Where there is no occasion to walk above, nor any chance of a mischievous person thrusting a pointed instrument through from below, as in the case of barns, churches, granaries, &c. common plaster-laths may be substituted, nailed on exactly as the boards, and forms the cheapest variety of paper-roof.

As to the sort of paper, any strong coarse paper will do. That used by button-makers is, perhaps, the best; unless a sort made on purpose by Mr. Swann, of Ensham, Oxfordshire.

For the preparation of the paper, a boiler, or cauldron, three feet wide and two deep, is required, and must be built over a furnace in the usual manner. This is to be filled, within six inches of the top, with tar and pitch, in the proportion of three parts of tar to one of pitch. The fire being applied, when it begins to boil the paper is immersed in it, one sheet at a time; and, as it is taken out, laid on a stack or pile, with a proper inclination to drain dry. A little grease of any sort is put between each sheet to prevent their adhering together. The mixture is kept hot during the operation, which must be repeated in a day or two, when the paper is dry. The whole process requires to be conducted under cover.

In nailing on the paper, begin at the eaves, and allow three inches for being turned down and nailed underneath the ends of the boards, which boards project an inch over the first rafter. If the paper is common coarse wrapping-paper, it is laid on much the same as slate, so that when finished it will remain double thickness all over the roof. If button-board paper, or that manufactured by Mr. Swann, which comes cheaper than button-paper, one sheet in thickness will frequently suffice; only each sheet, as laid down, must be made to overlap the one previously laid three inches on the two sides next it. Every sheet requires four nails; the proper nails are brads, one inch in length, with heads half an inch in diameter.

The composition to be laid on the paper consists of two parts of tar to one of pitch, thickened to the consistence of paste with equal parts of powdered charcoal and whiting or lime. It is previously well boiled, and kept constantly stirred; while still boiling, it is carried out in iron potsfulls, and instantly spread or painted over the roof with a hempen mop. This must be done with expedition, as it speedily cools, and gets hard. When properly laid on and dry, the joints of the paper are totally concealed and covered one eighth of an inch in thickness by this composition, which appears of a smooth and glossy black, inclining to blue. Strewing sand, forge-dust, or smithy-ashes, over the pitch as soon as laid on, by a large dredge-box, forms a thicker coating, and renders it less liable to melt with the sun and run off, or to blaze if the building should catch fire.

The advantages of this species of roof, says Mr. Loudon, are, its economy, durability, and elegance.

"The economy results, not merely from the lightness of the requisite timbers of the roof, but from the comparatively slender walls which will suffice for supporting it. At Tew, I found it cost from four pence to ten pence per square foot, all expenses included. A square foot of a roof, so flat as this, is reckoned to cover as much level surface as one foot and five sixteenths of a foot of roof raised to the ordinary pitch; so that, besides being cheaper per foot than the common roofs, five feet in sixteen is saved altogether. I found that a stone slated roof (at Grovash, the sort common in Oxfordshire) required fourteen feet of surface-covering, when a papered roof, with a rise of two inches to the foot, would only take ten feet

and a quarter; a difference of thirty per cent. in quantity. One rafter necessary for each stone flat roof would make three for a paper one. What the saving may be on walls of buildings so roofed, must depend on whether stones, brick, stud-work, or weather-boarding, is employed. Least saving can be made when the walls are built of stone, and the height only one story; as from the coarseness of the materials the walls must unavoidably be made of considerable thickness.

"Their durability may be inferred from the nature of the surface exposed to the air. We have no common substance indeed more durable than pitch, excepting lead. Proof, however, can be had from different buildings erected and roofed in this way many years ago; such as the church at Dumfermline, the prepared roof of which has stood forty years without requiring any repairs; the roofs of several warehouses at Greenock, Deal, Dover, Canterbury, &c. which have stood from ten to twenty years. Farm-houses in Scotland are frequently roofed in this way. The extensive mills, offices, and dwelling-house, at Ensham, have been covered with it, by Mr. Harris of Oxford; and Mr. Swann, of Ensham, informs me, that a roof of paper put up at his mill at Wolvercot, near Oxford, has been now done thirteen years, and never required the least repairs; whilst a blue slated roof adjoining has been a continual plague, from the slates being in that exposed situation; and indeed so great has been the damage sustained in consequence, that he has an intention of taking off the slates and covering it with paper. This will prove what will at first appear rather paradoxical, viz. that a light paper roof is less liable to be blown away than a heavy slate one.

"The flatness of those roofs being greater than that of slate, their resemblance to that material in colour, and their projection at the eaves, communicate ideas of lightness and Doric simplicity, unfelt in viewing any other species of roofs. In this respect, and in every other, my opinion is so decidedly in their favour for farm-buildings, churches, warehouses, and such edifices as do not require constant fires in them, that I should not use tile, even if it were to prove considerably cheaper. For slight movable edifices, such as Dutch-barns, sheep-houses, field-racks, &c. no roofs can be more appropriate.

"The only objections I have ever heard made to these roofs are, the danger of their being blown off by high winds, and their liability to accidents by fire. In regard to the last objection they seem to me not so liable to be set fire to as thatch. Pitch (especially if coated over with sand or smithy ashes) will not be lighted by a spark, nor even the application of a slender flame, as will that material; though, on the other hand, when lighted, it will unquestionably burn with greater velocity than any species of thatching. The other objection may readily be prevented by the builder. Before the roofs at Tew Lodge were finished, and through the carelessness of an unworthy man, who undertook part of them by the job, I had an accident by high wind, but none has happened since they were completed. I have been thus particular in describing the manner of constructing these roofs, to prevent their being confounded with some other modes of applying paper and composition which have proved unsuccessful, and nearly as expensive as the best slate-roofs."

PAPER, *adj.* Any thing slight or thin.—There is but a thin *paper* wall between great discoveries and a perfect ignorance of them. *Burnet*.

To **PAPER**, *v. a.* To register :

He makes up the file
Of all the gentry ; and his own letter
Must fetch in him he *papers*. *Shakespeare's Hen. VIII.*

To pack in paper.—To furnish a room with paper hangings.

PAPER-BOOKS, in law, are the issues in law, &c. upon special pleadings, made up by the clerk of the papers, who is an officer for that purpose. Upon an issue in law, it is termed the *Demurrer-book*. The clerks of the papers of the court of King's Bench, in all copies of pleas and paper-books made up by them, shall subscribe to such paper-books the names of the counsel who have signed such pleas, as well on behalf of the plaintiff as defendant ; and in all paper-books delivered to the judges of the court, the names of the council who signed these pleas are to be subscribed to the books by the clerks or attorneys who deliver the same. 2 *Lill. Abr.* 268.

PAPER-CREDIT, *f.* Property circulated by means of any written paper-obligation :

Blest *paper-credit* ! last and best supply,
That lends corruption lighter wings to fly ;
Gold, imp'd by thee, can compass hardest things,
Can pocket states, can fetch or carry kings. *Pope*.

PAPER-FACED, *adj.* Having a face as white as paper.—Better thou hadst struck thy mother, thou *paper-faced* villain. *Shakespeare*.

PAPER-KITE, *f.* A paper machine to resemble a kite in the air.—He [Arbutnot] was so neglectful of his writings, that his children tore his manuscripts, and made *paper-kites* of them. *Warton's Essay on Pope*.

Though now he crawl along the ground so low,
Nor weeting how the muse should soar on high,
Wistheth, poor starv'ling elf ! his *paper-kite* may fly.
Shenstone.

PAPER-MAKER, *f.* One who makes paper.

PAPER-MILL, *f.* A mill in which rags are ground for paper. See **PAPER**.—Thou hast caused printing to be used ; and, contrary to the king and his dignity, thou hast built a *paper-mill*. *Shakespeare*.

PAPER-MONEY, *f.* Bills of exchange, bank and promissory notes.—Whether the abuse of banks and *paper-money* is a just objection against the use thereof? *Bp. Berkeley's Quærist*.

The substitution of paper in the room of gold and silver money replaces a very expensive instrument of commerce with one much less costly, and sometimes equally convenient. Circulation comes to be carried on by a new wheel, which it costs less both to erect and maintain than the old one. When the people of any particular country have such confidence in the fortune, probity, and prudence, of a particular banker, as to believe that he is always ready to pay upon demand such of his promissory notes as are likely at any time to be presented to him, those notes come to have the same currency as gold and silver money, from the confidence that such money can at any time be had for them.

If we examine what the most celebrated and judicious authors have written respecting paper-money, we shall find that scarcely any of them have adverted with sufficient precision, and in a sufficiently decided and distinct manner, to the points of difference which exist between paper-money issued by government, and which it is rendered obligatory upon the people to receive, and that species of paper-money which consists in the notes of

the bank, or of bankers, payable to the bearer on demand, and which pass current for the sums specified in them. Of the former kind were the assignats and mandats issued by the government of France during the first years of the revolution ; the paper-money issued in America, before and during the war with this country ; that which was issued by the Dutch during their long and arduous struggle for independence ; and, generally speaking, the paper-money which most of the governments on the continent of Europe have found themselves compelled to issue during the French revolutionary wars. It will be sufficiently evident, from the slightest consideration of these two species of paper-money, that they differ completely and essentially in their nature, and that we shall be led far astray from the truth in our discussions on paper-currency, if we infer, from what has taken place respecting the one species, what will probably or must necessarily take place respecting the other species.

I. Of COMPULSORY PAPER-MONEY.

The paper-money issued in general by the governments on the continent of Europe, contains no promise to pay either on demand or at the termination of a limited and specific period ; it is, in reality, nothing more than paper stamped with the amount of the sum for which it is to pass current, and with such marks or signatures as may serve to distinguish what is genuine from what is forged. Here, then, we at once perceive an essential difference between government-paper and bank-paper : the former is in fact, strictly speaking, *paper-money* ; or, in other words, paper issued as money instead of the precious metals ; the latter is not, strictly speaking, paper-money, though thus denominated in general and popular language, but a written obligation to pay a certain sum of money on demand. Another striking and essential difference between these two species of currency arises from the distinction just pointed out : it is plain, that, if the written obligation to pay on demand is given by persons who are of undisputed and established credit, few will be disposed to refuse such written obligation, and therefore this species of paper currency will be received without compulsion, and, where the credit of the issuer or issuers is undoubted, equally as metallic money. But the reverse must be the case with regard to government paper-money : it contains no obligation to pay metallic money, and therefore will never be preferred to the latter, or taken, unless in cases where there is no alternative. With respect to bank-paper, it is sought after ; the taking of it is a matter of choice : with regard to government-paper, it is compulsory on the people ; the government which issues it, tenders it in payment of the debts which it may have contracted, and it is taken, only because, if it is refused, no other payment will be made. It may, however, be remarked, that another cause operates, in some degree, towards the acceptance and circulation of compulsory government-paper ; for, though this paper contains no obligation or promise to pay in metallic currency, yet, as all governments necessarily receive large sums from their subjects in taxes, the unwillingness of the people to receive this compulsory money is in some measure removed, by the conviction that part of it will be taken back by government in payment of taxes. It will be no difficult matter to perceive what, in almost every case, must be the consequence of an issue of compulsory government-paper : as long as any government confines itself to a metallic currency, there is some check to the extravagance and carelessness of its expenditure ; for, if it be extravagant or careless, it will experience great difficulty in replacing the money it has thus expended ; but, on the other hand, if it substitute compulsory paper-money in the room of a metallic currency, there can be no check to its carelessness or extravagance.

Money, of whatever it is composed, whether of metal or paper, like every other commodity, depends, for its value, on the proportion between it and the commodities for

for which it is exchanged : if this proportion is altered or deranged, the value of the money will be altered : if, while the quantity of money remains the same, the quantity of the commodities is diminished, the money must necessarily bear a larger proportion to them than it previously did ; and, consequently, its power to purchase them will be diminished : strictly speaking, however, this cannot, with propriety and precision of language, be denominated a depreciation of the currency, as the variation in its value or power of purchase, arises entirely from a change in the quantity of commodities, and not, in the smallest degree, from any alteration in the quantity of the currency. But if, while the quantity of commodities continues stationary, the amount of the circulating medium is increased, the consequence already pointed out will equally ensue ; that is, the power of the currency to purchase commodities will be diminished ; and the currency, therefore, so far as it is considered in relation to commodities, will be depreciated. But in all countries where a compulsory government-paper is issued, the metals, even when coined, soon are regarded solely as commodities, and are affected, equally with all other commodities, by the increased issue of the paper-currency. As, therefore, there is no check to the issue of government-paper, and extravagant or careless expenditure calls for increased issue, a depreciation of such paper necessarily ensues ; and each stage in the depreciation occasions a further issue, which in its turn increases the depreciation ; for, when the government perceives that one thousand pounds in paper-money, for instance, will no longer command the same quantity of the commodities which it needs that it would formerly do, but that one thousand and fifty pounds are requisite for this purpose, it is compelled to increase its issue of paper-money in this proportion ; and this increased issue, again raising the price of commodities, requires a still larger issue, the next time that the government has occasion to make a purchase.

On the first issue of compulsory government-paper, it is received with reluctance : metallic money is preferred to it ; and, where it can be procured, a premium is willingly given for it ; or, in other words, the compulsory government-paper is at a discount. But, if this is the case at the first issue of it, and when the amount is comparatively small, we may easily conceive what will be the consequence, if a larger and constantly-increasing quantity is forced on the people : this increasing quantity must act, not only in the manner which we have already described, towards its own depreciation, by the same process in which all commodities are depreciated by increase, but it will also operate towards its own depreciation in another manner. The very first issue of a compulsory government-paper is a sufficient proof of an impoverished and embarrassed government ; and every future issue, especially if the amount of the issue be increased, is a proof that the poverty and embarrassment of the government are increasing : but it is utterly impossible, that, while the poverty and embarrassment of a government are increasing, the confidence which the people repose in it can remain stationary : it must diminish, and a diminution of public confidence in a government displays itself in no respect so unequivocally and materially, as in the estimate which is formed of the value of the paper-currency. Here, then, we perceive the real and full state of the case, whenever a government increases the issue of its compulsory paper : a larger quantity of a currency, on its first circulation received with reluctance, and only because no other mode of payment could be obtained, is issued ; the increased issue, of itself, would necessarily diminish the value of the currency, but this consequence is increased by the suspicion which such a measure on the part of government creates, that the finances of government are on the decline ; hence, from the operation of both these causes, viz. an increased issue, and diminished confidence, a depreciation of the compulsory government-paper must necessarily ensue.

There is still another subject incidentally connected

with paper-currency, on which it may be proper to say a few words, before we proceed to the second division of this article. By many, bills of exchange, or exchequer-bills, payable only at a certain time, and bearing interest, are considered as paper-currency ; and it is contended that an increase in the issue of them has exactly the same effect as an increase in the issue of government or bank paper. This notion, though certainly plausible, and maintained by writers of considerable acuteness and knowledge on the subject of political economy, a little reflection will serve to convince us is erroneous and unfounded. We have only to reflect on the nature and operations of currency, to be convinced that bills of exchange and exchequer-bills do not form a part of it ; and, indeed, that notes bearing interest, are by that very circumstance excluded from the character and operations of currency ; and that the increased issue of these, so far from tending to depreciate the value of money, must rather operate to raise it. Bills of exchange, and exchequer-bills, are brought into the market, not for the purpose of employing them in the purchase of commodities, but for the purpose of sale ; and they are generally bought by those who wish to put out their money to interest : hence they may operate on the rate of interest, but they cannot operate on the price of commodities, unless it be, as has been already stated, to lower the price of commodities, or, in other words, to raise the value of money. That they may have this effect will appear from the following considerations : Let us suppose that the money and commodities in any market bear a certain proportion to one another, and that this proportion is disturbed, by the introduction, either of a greater quantity of some of the commodities formerly in the market, or by the introduction of some new commodity ; it is plain that in either case, if the quantity of money continue the same, its value or power of purchase will be increased, since it will now exchange, not merely for the commodities formerly in the market, but also, in addition, for the increased quantity of the old commodities, or for the new commodities. If, instead of a new commodity properly so called, we suppose that a person comes into the market, wishing to borrow money, and offering such a rate of interest as secures to him part of that money which used to be expended in the purchase of commodities ; in this case, also, the value of the money, or its power to purchase, must be increased, since it will now command, not only the commodities it formerly did, but also the interest offered for the sum wished to be borrowed. But in this question, it is a matter of mere indifference in what manner the interest to be paid is promised or secured ; whether in the usual way, or by bills of exchange, or by exchequer-bills. The general fact and consequence are precisely the same in all cases : if bills of exchange or exchequer-bills are brought into the market, they are brought, not to purchase commodities with, but for sale ; and, if they are sold for part of that money which used to be expended in the purchase of commodities, it is evident that the price of these commodities must be lowered, not raised, by the introduction of these bills of exchange, or exchequer-bills ; and consequently, that as their nature and operation is that of commodities, not of circulating medium, their issue cannot lower the value of money, but must, in some degree, tend to raise it.

II. OF PAPER-MONEY PAYABLE ON DEMAND.

Bank-notes have very generally, but very erroneously and improperly, been denominated the representatives or symbols of coin. This is one, among many other instances of vagueness and confusion of ideas, arising from the injudicious and careless use of metaphorical language, which has so much retarded the advance of the science of political economy. What precise or clear idea can we attach to the term representative of coin ? or how can bank-notes be so denominated ? It has been justly remarked, " that the most accurate representatives of coin are well-fabricated counterfeits ; yet every man, when he knows

5 E them,

them, refuses them in payment." A bank-note does not represent coin; nor is it circulated and received on that account; but it is an obligation on the part of the person or persons who issue it to pay, on demand, a certain quantity of gold or silver. A common cheque upon a banker, which nobody ever dreamed of calling a representative of money, is just as much a representative of it as bank-notes; nay, in fact, the order which the manufacturer, on the Saturday night, puts into the hands of one of his workmen, to get from his clerk the wages of the week, is a representative exactly of the same description. The only real difference in practice is, that the one obligation generally passes but through one or a few hands, till it comes upon the obligee: the other passes through many hands, each accepting it as a satisfactory security for the valuable commodity which it is an order to receive.

With regard to the effects of paper-money, they may be considered under two heads: the effect it produces on the price of commodities, and the effect it produces on the metallic currency along with which it circulates. Mr. Hume entertained the notion that paper-money raises prices; whereas Mr. Adam Smith, referring to what he considers as a general fact in the theory of circulation, that every addition of paper to the currency displaces an equivalent quantity of gold, holds an opposite opinion. This notion of Smith, however, must be received with some limitation: if, by an addition of paper to the currency in any country, the price of any commodity is raised in that country so high as will pay for its importation, it will be imported, and part of the metallic currency will probably be employed to pay for the commodity thus imported. But, whenever the addition made to the currency by paper-money is employed in the production of commodities, and the increase in the quantity of these commodities is in the same proportion as the increase to the currency, by the addition of paper-money, there will be no reason for exporting gold; and the whole currency, consisting of the precious metals and of paper, will be no more than is necessary to circulate the increased quantity of commodities in the market. In considering this branch of the subject in a more extended sense, it will be necessary to look to the effect produced on the value of the precious metals, in the general market of the world, by the addition of paper to the currency of any particular country, in cases where that addition, not producing a corresponding increase in the quantity of commodities, enhances their price, and thus leads to the exportation of gold from the country where the paper-currency is issued. In these cases, the same exportation of gold, which remedies the temporary rise that takes place in the particular country where paper has been issued, has a tendency to increase the supply of precious metals in the general market of the world, and thus to occasion a general rise of prices in which that particular country must participate. The whole quantity of bullion, of which Great Britain has spared the use by adopting a different medium of domestic exchange, is added to the general stock of the mercantile commonwealth, as much as if an equal quantity had been brought additionally from America; and the saving of that annual loss which would have been occasioned by the waste of British coin, is equivalent to an increase in the annual produce of the mines.

On the whole, with respect to the effect of a paper-currency on the price of commodities, and on the precious metals with which it circulates, it may be remarked, that it must vary according to the circumstances under which the paper-currency is emitted, and the quantity which is thrown into the market; and these variations in its effects will more properly be considered under the next head, viz.

III. ADVANTAGES AND DISADVANTAGES OF PAPER-MONEY.

1. The first advantage resulting from the use of a paper-money, which occurs to the observation of a person reflecting ever so superficially on the subject, is, that by the

substitution of paper in the room of gold and silver money, a very expensive instrument of commerce is replaced by one much less costly. So far the substitution of paper-money must be advantageous to the community. The currency of a country is a part of its capital, which may be considered as unproductive: it is, indeed, necessary to carry on the operations of its commerce, but it does not, strictly speaking, increase that commerce; it is, therefore, of the utmost importance, that this instrument, thus unproductive, should be procured and kept in action with the least possible expense. But, where gold and silver alone are employed as the currency of a country, they must either be obtained directly from the mines at great labour or expense, or purchased by commodities on which the same quantity of labour and expense has been laid out. Again, if in a country, the currency of which consisted entirely or principally of gold and silver, a paper-currency is introduced, it is evident that a part of its former metallic currency will be set at liberty, and may be expended in the purchase of foreign commodities. Paper-currency, as we have already shown, is in fact only an obligation to pay on demand a specific sum of gold and silver; it therefore might be inferred, that the substitution of paper for gold and silver would not set at liberty any portion of the latter, since it would be necessary to retain the whole, in order to answer the demands of those who brought the paper-currency for payment. But the fact is, that a comparatively small proportion of gold and silver is required to answer the demands occasioned by a very extensive paper-circulation; those who issue bank-notes soon ascertain, with sufficient and perfectly-secure precision, the exact amount of gold and silver which it is necessary or prudent to keep by them, and the rest is employed in the purposes of commerce.

Whatever evils may have resulted from an injudicious and superabundant issue of paper-money, there can be little doubt that this species of currency has been of great service in increasing the produce and extending the commerce of the country. Let us suppose an instance of common occurrence, and of no intricacy or complication in its detail: A gentleman possesses a large estate, that is in a great measure in an uncultivated and unproductive state: he does not possess the capital adequate to the full improvement of it; and yet there can be no doubt, that if sufficient capital were laid out upon it, in a judicious and skilful manner, not only the owner, but the community, would be greatly benefited. In a country destitute of paper-currency, he would experience great, perhaps insurmountable, difficulties, in borrowing the requisite capital; whereas, in a country possessed of a paper-currency, the means of improvement would be easily obtained, and a great increase of produce, and consequently of wealth, would be added to the public stock. Whoever has watched the progressive improvement of Great Britain, not only in the extended and superior cultivation of her soil, but in the increase of her manufactures and commerce, must be convinced that the rapid and great advances she has made in wealth within these few years, have been in a great measure owing to her paper-currency.

The following passage from Smith's *Wealth of Nations* will set the advantages of a paper-currency, perhaps, in a still clearer light. "It is not by augmenting the capital of the country, but by rendering a greater part of that capital active and productive than would otherwise be so, that the most judicious operations of banking can increase the industry of the country. That part of his capital which a dealer is obliged to keep by him unemployed, and in ready money, for answering occasional demands, is so much dead stock, which, so long as it remains in this situation, produces nothing, either to him or to his country. The judicious operations of banking enable him to convert this dead stock into active and productive stock; into materials to work upon, into tools to work with, and into provisions and subsistence to work for;

for; into stock which produces something, both to himself and his country. The gold and silver money which circulates in any country, and by means of which the produce of its land and labour is annually circulated and distributed to the proper consumers, is, in the same manner as the ready money of the dealer, all dead stock. It is a very valuable part of the capital of the country, which produces nothing to the country. The judicious operations of banking, by substituting paper in the room of a great part of this gold and silver, enable the country to convert a great part of this dead stock into active and productive stock; into stock which produces something to the country. The gold and silver money which circulates in any country may very properly be compared to a highway, which, while it circulates and carries to market all the corn and grain of the country, produces itself not a single pile of either. The judicious operations of banking, by providing, if it may be allowed so violent a metaphor, a sort of waggon-way through the air, enable the country to convert, as it were, a great part of its highways into pastures and corn-fields, and thereby to increase very considerably the annual produce of its land and labour. The commerce and industry of the country, however, it must be acknowledged, though they may be somewhat augmented, cannot be altogether so secure, when they are thus, as it were, suspended upon the Dædalian wings of paper-money, as when they travel about upon the solid ground of gold and silver. Over and above the accidents to which they are exposed from the unskilfulness of the conductors of paper-money, they are liable to several others, from which no prudence or skill of those conductors can guard them."

2. The disadvantages and evils of paper-money, indeed, arise from the same causes which produce its advantages and benefits: we must never forget, that the foundation of paper-money is *credit*; that it is, in fact, an obligation to pay on demand a certain sum of metallic currency. Credit does not create capital, it only sets that portion of capital in operation, which would otherwise be inactive: the person who gives credit, in reality gives part of his capital, which he has not the disposition or the means to employ: and the person who receives credit or capital, by employing his industry and skill along with his borrowed capital, is enabled to repay it, and the stipulated interest. So long as the credit of the lender is good, and the repayment of the borrower punctual or undoubted, so long a paper-currency thus established, if not pushed too far, must be beneficial to the lender, the borrower, and the nation at large. But let us suppose that, from any cause, confidence in the paper-money of a country was destroyed or shaken, and we shall immediately perceive the disadvantages and evils of this species of currency, as compared with a metallic currency. Where the commercial transactions of a country are entirely carried on in a metallic currency, opinion has no room for operation: no confidence is reposed; commodities are sold, not for what may or may not be worth the value which they represent or promise, but for what possesses absolute and intrinsic value. No circumstance will point out and exemplify the difference between a paper and a metallic currency so clearly and strikingly, as the invasion, or dread of invasion, in the countries in which they respectively exist. If a country, the currency of which consisted principally or entirely of paper, were actually invaded, or threatened with invasion, or even if its internal state were convulsed or disturbed, or its finances considerably disarranged, its paper-currency would be immediately affected: its value would fall, in proportion as the confidence reposed in it was diminished: people would prefer metallic currency for this strong and obvious reason, that whoever had possession of the country, whatever change took place in its government, or into whatever circumstances of political or financial embarrassment and confusion it was thrown, the value of the metallic currency would

remain unchanged, whereas the value of the paper-currency would be subject to constant variation, and might probably be totally destroyed.

It is sometimes objected to a paper-currency, that, by exchanging commodities for it, we in fact get nothing valuable; whereas, when we sell our commodities for gold or silver, we obtain something of real and intrinsic value: but this observation amounts to nothing, provided the *credit* of the paper-currency be good; it is, indeed, founded on the erroneous idea, that when we sell our commodities, we look for any thing else in the money which we receive, but the certainty that it will be taken from us at an undiminished value. When a person sells a quarter of wheat for five pounds, it must be a matter of perfect indifference to him, whether he receives five pounds in silver, or five pounds in paper, provided he is convinced that, in the purchase of what he may want, the latter will go as far as the former: in selling his wheat he is never disturbed by the idea, that five pounds in silver have intrinsic value, i. e. value as metal, while the five pounds in paper possess no intrinsic value; the power each possesses over commodities is all he regards, and, if that power be equal, their value, for all the purposes he needs them for, is equal in his estimation.

It has also been objected to paper-currency, that its use is solely confined to transactions of domestic traffic; and consequently that a country, which has no other species of currency, must go to a foreign market to purchase commodities at a great disadvantage. The fact is undoubted, that, generally speaking, a paper-currency is without value in a foreign country; but the inference by no means follows, that on this account foreign commodities must be purchased by a country which possesses only a paper-currency at a great disadvantage. On the first establishment of a paper-currency, the very reverse must be the case; or, to speak more correctly, the establishment of a paper-currency setting loose a portion of the metallic currency, this may be employed in purchasing a larger quantity of foreign commodities than the country could afford to purchase while this metallic currency was necessary for the circulation of its internal commerce. But, even after a paper-currency is established, foreign commodities may be purchased at an equally-cheap rate as they were while the currency was metallic; for, in the first place, foreign commodities are seldom purchased by the coin of the country purchasing, but either by bullion, or the interchange of commodities; and secondly, while a bank-note for a guinea will exchange for a guinea, it will always command, indirectly, the same quantity of foreign commodities, as could be purchased if the currency were entirely metallic.

But the objection to paper-currency, urged most frequently and with the most confidence, arises from the extreme facility with which it may be increased, the strong temptations to increase it, and the evils to the community to which an improper increase must give rise. This objection naturally leads us to consider the nature and process of the checks to the over issue of bank-paper, when it is payable on demand.

3. It may be proper first to consider what is meant by an *over-issue of paper-money*: the term is too often used without any clear and definite idea being attached to it. When the quantity of circulating medium, whether metallic or of paper, is increased in a country, the increase either operates to the production of a great quantity of commodities, that is, is usefully employed, or it merely operates to raise the prices of the commodities already in existence: before, therefore, the addition of any sum to the circulating medium can be said to be an over-issue or not, the effects produced by it must be traced and ascertained: if a correspondent addition to the quantity of commodities has taken place, there cannot be said to be an over-issue of currency; but, if no such correspondent addition has taken place, as the sum added to the currency

rency cannot be inactive or unapplied, a rise of price must take place, and then an over-issue may justly be said to have occurred. Those who sell as well as buy, probably will not be much or long injured by this rise, since any addition to the currency is not long in adjusting itself to the various commodities in the market; and, consequently, if some commodities are bought dearer, other commodities are sold dearer: but those persons, whose whole property consists in money, are injured, when there is an over-issue of the currency; i. e. when an addition to the currency does not produce a correspondent addition to the commodities in the market. While the currency is entirely metallic, they are in a great measure guarded from a sudden or violent over-issue, and consequently, from a sudden or violent rise of prices, or depreciation of money, their sole property; since, before any great addition can be made to the circulating medium, additional labour must have been bestowed on the mines. But, where paper-currency is established, the case at first sight seems different; the value of their property, i. e. money, is at the mercy of all who can issue bank-notes. If, however, we investigate what actually takes place, where there is a paper-currency *payable on demand*, we shall find that the property of the moneyed man is guarded as effectually, though not so directly, as if the currency were metallic.

Let us suppose a large addition to be made to the paper-currency of any particular district in this country. This addition operates either to the rise of prices solely, or to an increase in the quantity of commodities; in the latter case, the moneyed man has no cause to complain; there is indeed more money in his neighbourhood, but, as there are also more goods, the value of his money is not affected. On the other supposition, that the increase to the paper-currency raises the price of commodities, let us see what will occur: those commodities, the price of which is raised, will be purchased in another district, where they have not undergone a similar rise; but, before they can be purchased, the local notes must be exchanged for such as are current in the district where the purchase is to be made; or, in other words, some part of the over-issued notes will return to the bank which issued them. This will be a sufficient proof and warning to the bank, that they have issued more notes than the commercial transactions of the district required; and as, on notes almost immediately returned, the expense in manufacturing them, and their proportion of the establishment, must far exceed the profit made on them while they were in circulation, the bank will be careful in future not to over-issue their notes.

A process similar in all its steps, and in its result, will take place, if the Bank of England, while subject to be called upon for cash-payments, should over-issue their notes: the over-issued notes will either spread themselves over the country, for the purchase of such commodities as have become cheaper in the country than in London, by the addition to the circulating medium, or they will be returned to the Bank of England for gold, wherewith to go to a foreign market.

Thus it would appear that the property of the moneyed man is rather more secure, and better protected from depreciation, in a country, the currency of which consists of paper payable on demand, than in a country, the currency of which is entirely metallic; since, in the former country, the real and well-understood interest of those who issue the paper-money must lead them most carefully to avoid any over-issue; whereas in a country, the currency of which is entirely metallic, though no addition to it, sufficient to raise the prices, can long remain in it, yet it may both remain longer than an over-issue of paper money, and be repeated more frequently.

4. We now come to consider, lastly, the state of bank-paper, *when not payable on demand*, so far as regards its over-issue, and its supposed depreciation arising from this or other causes.

The suspension of cash payments in the Bank of England, in the beginning of the year 1797, forms a most memorable era in the history of the science of political economy; and the undiminished confidence, which after this measure was, and is, reposed in the Bank-of-England notes, has shaken to the foundation many favourite theories in this most intricate and delicate science. By some it is alleged, that the confidence in Bank-of-England paper remained the same, even after the suspension of cash-payments, because there was a general and well-founded belief, that the Bank was able to pay all its notes in specie; but something more than mere ability would seem necessary to inspire or continue confidence. Of what moment is it to the holder of a Bank-of-England note, to be told that the Bank can pay it in specie, if he knows that they will not, and that he cannot compel them? By others it was argued, that the confidence was still continued, because it was expected, that in a short time cash-payments would be resumed. This consideration might have operated on some persons at the time of the imposing the restriction; but afterwards it could have no weight, as the expectation that cash-payments would soon be resumed, were till very lately utterly banished from the mind of every man; and yet no diminution of confidence took place. The continued confidence, without diminution, in the Bank-of-England paper, after they were relieved from the obligation to pay in cash, seems to have arisen from the following circumstances. All the principal merchants, and government itself, declared their willingness to receive bank-paper as before; the mass of the nation were content with this; for, though intrinsic value is indispensably necessary at first to give circulation, yet, in process of time, that circumstance is never adverted to, except by those whose business it is to watch the variations in the value of the metals of which the money is formed. The nation at large knew, that the Bank would no longer pay in cash; but they also knew, that Bank-of-England paper, though thus deprived of its intrinsic value, would be received the same as before by all those to whom their principal or most common payments were to be made: as, therefore, the bank-paper still retained the character and uses of money, the alteration in its intrinsic value was not adverted to.

With respect to the danger of over-issue, when cash-payments are suspended, it is argued, that it is merely chimerical; since no one will pay interest to the Bank for money, from which he does not expect to derive more profit than the interest he pays; and consequently, as all issues are made for commercial purposes, they will not be carried to a greater extent than the state of commerce requires. But it may be very true, that there are no issues, but what the state of commerce requires, and what will produce, or are expected to produce, a profit to the borrower; and yet there may be an over-issue of bank-paper; or, in other words, an issue that will raise the price of commodities; since, in many instances, the profit expected by the borrower may arise from this increase of prices. Let us suppose a merchant wishes to buy largely cotton, corn, or any other commodity, and for this purpose gets his bills discounted at the Bank-of-England: his speculations succeed, and he makes a large profit; in this case, the price of the cotton or corn is necessarily increased by the greater sum brought into the market for the purchase of it, by means of the discount afforded by the Bank-of-England: there is a real commercial transaction; and yet, as there is no increase in the quantity of commodities, but a mere transfer, the bank-notes issued for this purpose ought to be considered an over-issue, that is prejudicial to the property of the moneyed man, though advantageous to the bank and the merchant.

It is evident that paper-money, when not payable in cash on demand, must be more liable to depreciation from any doubt respecting the security of the country, than if it could be converted into cash at pleasure; but

how far it is liable to depreciation from other causes, is a question on which there is much difference of opinion. If, as we have endeavoured to show, there may be an over-issue, i.e. such an issue as will raise the price of commodities, the price of gold and silver bullion must rise as well as all other commodities; but, when the bullion-price of the metals rises above the mint-price, the coin will soon be regarded only as a commodity, and will, in spite of all laws and penalties, be bought and sold as such. When a difference in the estimated value of paper-currency takes place, from whatever causes it may arise, one of two effects must follow: either the paper-currency and the metallic-currency will be equally current, each at its respective value; or the metallic-currency, being regarded solely as a commodity, will disappear. Where depreciation has occurred from want of confidence, it has generally happened, that the paper and metallic-currency have circulated together, each at its own value; but where depreciation has taken place, from an increase in the quantity of paper, from a diminution in the quantity of the precious metals, or from an increased demand for them, it has generally happened, that the metallic-currency, being regarded solely as a commodity, has disappeared.

These two different effects may easily be accounted for. A rise in the price of bullion, occasioned by an over-issue of paper, by a diminished supply of bullion, or by an increased demand for it, is only known to, and acted upon by, comparatively a few people. The great mass of the nation, as has been already observed, in receiving or paying money, do not advert in the slightest degree to the character or value of the money as bullion, but solely to its character and value as a means of interchanging commodities; the variations in its bullion-value, therefore, are unheeded both in their payments and receipts; they are, however, constantly and carefully watched by all whose business consists in dealing in bullion; and, as soon as the bullion-value of coin exceeds its mint-value, it disappears from circulation by their means. The case is widely different, when there is any alarm respecting the credit of the paper-currency; in this all are immediately and deeply concerned; all are eager to exchange it for the precious metals; and under these circumstances, as the precious metals, in their character of coin, can thus be exchanged for as much paper as they could command as bullion, there is no temptation to withdraw them from circulation.

It is not just, therefore, to infer, that the paper-currency of a country is not depreciated, because two prices do not exist, if the other effect of depreciation, viz. the disappearance of the precious metals, has taken place; each circumstance marks depreciation, but of a different kind, and arising from different causes. On the other hand, is it not fair to infer, that the credit of the paper-currency, or in other words, a difference of value between the paper-currency and the coin it promises to pay, may arise, like a difference of value between any other two commodities, from the quantity of the one being increased, or the demand for it being diminished, or from the quantity of the other being diminished, or the demand for it being increased? See Smith's *Wealth of Nations*; Thornton on *Paper Credit*; and our article *BANK*, vol. ii. p. 674-8.

PAPER-OFFICE, (in the palace of Whitehall,) is an ancient office, where all the public writings, matters of state and council, proclamations, letters, intelligences, negotiations of the king's ministers abroad, and generally all the papers and dispatches that pass through the offices of the secretaries of state, are lodged, and disposed in the way of library. It was chiefly from this noble repository that bishop Burnet had materials for his *History of the Reformation*.

PAPER-OFFICE, sometimes called *Paper-mill*; an office, or room, in the Court of King's Bench, where the records belonging to that court are deposited.

VOL. XVIII. No. 1251.

PAPES'CENT, *adj.* Containing pap; inclinable to pap. —Demulcent, and of easy digestion, moistening and solvent of the bile, are vegetable sopes; as honey, and the juices of ripe fruits; some of the cooling, lactescent, *papescent*, plants; as cichory and lettuce. *Arbutnot on Aliments*.

PA'PESS, *f.* [from *pape*, Fr.] A female pope.—The man, as ill as he loves marriage, will needs make a match betwixt his Gratian's pope Stephen, and his pope Joan. *Io Hymen!* Was ever man so mad to make himself part-time with his own shame? Was the history of that their monstrous *papes* of our making? *Bp. Hall's Honour of the Marr. Clergy*.

PA'PHIA, one of the names of Venus.

PA'PHIAN, *adj.* Belonging to Paphos; applied to Venus. See **PAPHOS**.

PAPHLAGONIA, in ancient geography, a province of Asia Minor, situated on the Euxine Sea, between Bithynia to the west, and the gulf Amifenus towards the east; to the south was Galatia. When other divisions were introduced, such as the province of the Hellespont, &c. the name of Paphlagonia disappeared. The river Parthenius served for a considerable time as a boundary between Paphlagonia and Galatia. Towards the east the mouth of the Halys served as a limit to Paphlagonia on that side. In the interior of the country were the Heneti or Veneti, regarded as the progenitors of those who afterwards passed over into Italy; they occupied the parts towards the north. In the centre of Paphlagonia was a province called *Domanitis*, which included a considerable town under the name of Germanicopolis, (*Kastamoni*.) This country is called *Pylemenia* by some. *Paphlagones*, the people, are mentioned by Homer, and therefore of no small antiquity; he calls them a brave people; while Lucian stigmatizes them as superstitious and silly. Borchart derives their name from *Phaleg*.

PAPHOS, in ancient geography, two adjoining islands on the west side of the island of Cyprus; the one called *Halle Paphos* (Strabo, Ptolemy, Pliny); the other *Nea Paphos*; and, when mentioned without an adjunct, this latter is always understood. Both dedicated to Venus, and left undistinguished by the poets (Virgil, Horace). Hence Venus is furnished *Paphia*.

Pausanias relates, that the Arcadians, in returning from the war of Troy, were cast by a tempest on the isle of Cyprus. Agapenor, their chief, founded a colony at Paphos, and there erected a temple in honour of Venus, about 1184 B.C. In this temple was an oracle, which was consulted by Titus, in his way to compliment Galba upon his elevation to the empire. When Cato was sent to the isle of Cyprus, he was assured by Ptolemy, that if he retired without opposition he should want neither money nor honour, and that the Roman people would confer upon him the profitable and honourable post of chief priest of Venus. The first town that bore the name of Paphos was in the interior of the country; the second, Neo Paphos, was on the sea-coast; here the goddess of beauty was particularly worshipped; and all male animals were offered on her altars, which, though a hundred in number, daily smoked with a profusion of frankincense. The inhabitants were very effeminate and lascivious, and the young virgins were permitted by the laws of the place to get a dowry by prostitution.

The abbe Mariti, in his *Travels through Cyprus*, gives the following account of the island of Paphos. "It is situated (says he) on the southern side of the isle of Cyprus. It contained the celebrated temple of Venus; which, together with the city, was destroyed by an earthquake, so that the least vestige of it is not now to be seen. A lake in the neighbourhood, which even in summer overflows with stagnant and corrupted water, renders the air in some degree unwholesome. On the western coast is the New Paphos, called by some of the modern geographers *Bafos*; a name which is unknown in the island of Cyprus. That we may not positively ascribe to the latter

ter every thing that history tells us of Paphos in general, it may not be here improper to mention that it has been several times destroyed. This city had a port, where vessels trading upon the coast, still cast anchor: but this happens only in summer; for, being exposed to every wind, it is extremely dangerous. The bottom of it is full of sharp rocks; which sometimes destroy the cables so much, that mariners are obliged to keep them afloat on the surface of the water, by means of empty casks fixed to them at certain distances. In the neighbourhood there are two castles; one on the borders of the sea, and the other on the summit of a little hill: but the latter is at present in ruins. The government of Paphos consists of a *digdaban*, or commissary; a *cadi*; and an *aga*, who presides over the custom-house. Of all the Christian edifices, there is none remaining but the church of St. George, in which service is performed by the Greek ministers. The productions of this part of the island, which are all of an excellent quality, are silk, barley, and other kinds of grain. To discover the origin of the Old and New Paphos, would be carrying light into the midst of the thickest darkness. When we have added conjecture to conjecture, we are still in the same situation. As this is an attempt superior to my abilities, I shall leave it to the divining, though uncertain, knowledge of our antiquaries. I must, however, observe, that in this island St. Paul by his eloquence converted Sergius, a Roman proconsul: here likewise he conferred the deaconship on his disciple and colleague Titus, who soon after suffered martyrdom. Paphos was an episcopal city in the time of the Lusignans; and it is still the seat of a bishop, who is suffragan to the archbishop of Nicosia. On the western side of the island there are a great number of scattered villages; but they are not worthy of notice, being either abandoned or in ruins."

Mr. Bruce informs us, that in the neighbourhood of this place many silver medals of excellent workmanship are dug up; but that they are of little estimation among antiquarians, being chiefly of towns, of the size of those found at Crete and Rhodes, and in all the islands of the Archipelago. There are some excellent Greek intaglios, generally upon better stones than usual in the islands; particularly some heads of Jupiter, remarkable for bushy hair and a beard of excellent workmanship, and worthy of any price. All the inhabitants of the island are subject to fevers, but especially those in the neighbourhood of Paphos. The same traveller observes, that Cyprus was very long undiscovered; for, though ships had been sailing on the Mediterranean 1700 years before Christ, and though the island is only a day's sailing from the continent of Asia on the north and east, and little more from that of Africa on the south, it was not known at the building of Tyre, a little before the Trojan war, that is, 500 years after the neighbouring seas had been navigated. It was covered with wood at its first discovery; and our author is of opinion, that it was not well known even at the time of the building of Solomon's temple; because we do not find that Hiram king of Tyre, though just in its neighbourhood, ever had recourse to it for wood; though the carriage would undoubtedly have been easier from thence than to have brought it down from the top of Mount Lebanon. Eratosthenes informs us, that in ancient times the island was so overgrown with wood, that it could not be filled; so that they first cut down the timber to be used in the furnaces for melting silver and copper; that after this they built fleets with it: but, finding even this insufficient, they gave liberty to all strangers to cut it down for whatever purpose they pleased; and not only so, but they gave them afterwards the property of the ground they had cleared. Matters are now quite altered; and the want of wood is a principal complaint in most parts of the island. About Acamas, however, on the west side of the island, the wood is still thick and impervious, inhabited by large stags and wild boars of a monstrous size.

PA'THUS, a son of Pygmalion, by a statue which had been changed into a woman. See PYGMALION.

PA'PIA, *f.* in botany. See LAMIUM.

PA'PIAN-POPÆ'AN LAW, in Roman antiquity, was enacted by the consuls M. Papias Mutilus, and Q. Popæus Secundus. This law obliged all men to marry at a certain age, established great exemptions and privileges in favour of those that had children, and laid heavy fines on all who after a certain age continued single. It was also called the *Julian law*, because it had been published by the order of Augustus, who was of the Julian family. The severity of this law was mitigated by Tiberius.

PA'PIAS, bishop of Hierapolis, a city of Phrygia, is placed by Cave under the year 110; but, according to others, he flourished about the year 115 or 116. How long he lived is uncertain. Stephen Gobar, as quoted in Photius's Codex, asserts that he died a martyr; and the author of the Alexandrian Chronicle affirms that he suffered at Pergamos during the severe persecution in the reign of Marcus Aurelius; but, since neither Eusebius nor Jerome mention this circumstance, it must be admitted to be at least of doubtful authority. Irenæus speaks of him as a hearer of John, and companion of Polycarp; and by John seems to intend the apostle and evangelist. Eusebius, however, and Jerome, observe, that Papias "does by no means say, that he heard or saw any of the holy apostles, but only, that he received the things concerning the faith from those who were well acquainted with them; that he received the apostles' sayings from those who conversed with them; and that he was a hearer of Aristion, and John the presbyter." The character which they give of Papias is, that he was a good man, but very credulous, and of mean abilities, who delighted much in hearing and telling stories, and relating miracles which he learned from tradition. He was the first who propagated the famous notion concerning the *Millemium*, or personal reign of Jesus Christ upon earth for a thousand years after the resurrection, when he believed that the elect should be gathered together at Jerusalem, and enjoy all the felicity imaginable during that period. Papias was the author of "An Explication of the Oracles of the Lord, in five books;" of which we have now nothing left, excepting the fragments which are preserved in the writings of Irenæus and Eusebius. These are chiefly valuable on account of the testimony which they afford to the genuineness of the Gospels of St. Matthew and St. Mark, and of the first Epistles of St. Peter and St. John. *Cave's Hist. Lit.* vol. i. *Lardner's Cred.* vol. i.

PA'PIER-MACHÉ. See the article PAPER, p. 359.

PAPIGOHA'VEN, a bay on the east coast of Scotland, and county of Caithness: one mile north of Wick.

PAPIL'IO, *f.* [Latin.] The BUTTERFLY; in entomology, a genus of insects of the order lepidoptera. Generic characters: Antennæ thickening towards the extremity, commonly terminating in a knob or clavated tip; wings, when sitting, erect and meeting upwards. They fly in the day-time; and are thus distinguished from the moths, which fly in the night.—Conjecture cannot estimate all the kinds of *papilios*, natives of this island, to fall short of three hundred. *Ray.*

There is no class of insects which has been more accurately examined, or whose history has been more fully detailed, than that of the butterfly and moth. Two large volumes have been dedicated solely to this tribe by the indefatigable Reaumur.

The larvæ of butterflies are universally and emphatically known by the name of *caterpillars*, and are extremely various in their forms and colours; some being smooth, others beset with either simple or ramified spines, &c. and some are observed to protrude from their front, when disturbed, a pair of short tentacula or feelers, somewhat analogous to those of a snail.

A caterpillar, when grown to its full size, retires to some

some convenient spot, and, securing itself properly by a small quantity of silken filaments, either suspends itself by the tail, hanging with its head downwards, or else in an upright position, with the body fastened round the middle by a proper number of filaments. It then casts off the caterpillar skin, and commences *chrysalis*, in which state it continues till the inclosed butterfly is ready for birth, which, liberating itself from the skin of the *chrysalis*, remains till its wings, which are at first very short, weak, and covered with moisture, are fully extended; this happens in the space of about a quarter of an hour, when the animal suddenly quits the state of inactivity to which it had been so long confined, and becomes at pleasure an inhabitant of air. It is then that the insect enters upon a more enlarged sphere of action, with increased powers: he ranges from flower to flower, darting his rostrum into their nectaria for the delicious stores they contain. Then too, in the full possession of every faculty granted to his race, he prepares to multiply and perpetuate it. This last and most considerable metamorphosis is attended with a greater change in the economy of the animal than any of the preceding; not only the skin, but the teeth, jaws, and cranium, are left behind. The large artery which passes along the body may be considered as a succession of different hearts employed in circulating the blood, which is at that important æra observed to flow in a different direction from what it did before, like the fœtus of a quadruped after birth. Formerly it circulated from the extremity to the head: it now pursues a course directly opposite.

It is well known that the wings of butterflies are covered with a coloured powder; this powder, when examined through a microscope, is discovered to be nothing but an assemblage of feathers of the most elegant structure, erected on the surface of the wings, which gives them a great resemblance to the coloured plumes of large birds. How very minute must be the vessels which convey the fluids to the extremities of these feathers! and how curiously must the nutritive function of these animals be distributed! And, as their nourishment is only the most exquisite juices of flowers, how fine must be the terrestrial particles contained in that nectar, and which is spread over the extremities and surface of these feathers! See farther under the article ENTOMOLOGY, vol. vi. p. 834, 5, 6.

Insects have been long divided into two categories, according to the structure of their mouths, some having teeth well developed and which can divide solid food, while others have trunks or suckers adapted for liquids only. There are even some which, at different periods of their lives, assume both these forms of mouth; and in which a metamorphosis changes into suckers, when in their perfect state, what were masticators in their state of larvæ: such, for instance, are the *butterflies*, which feed by a double trunk only, generally spiral, which they unroll in order to introduce it into the bottom of the corolla of flowers to suck the nectar; whereas *caterpillars*, which are butterflies not yet developed, have their mouths armed with strong teeth, with which they cut the hardest leaves. Thus it has been supposed, that the caterpillar, in taking the wings, the long legs, and the beautiful antennæ, of the butterfly, also took its trunk and lost entirely its teeth. M. Savigny, the member of the Institute of Egypt, has proved, by some delicate and accurate observations, that this is not the case entirely; but that Nature, in this as well as in many other cases, confines herself to altering certain parts in order to develop others from them; thus producing effects entirely opposite by these simple changes of proportion. He has discovered, at the basis of the trunks of the butterfly, two organs of extreme minuteness, but which nevertheless represent the teeth of the caterpillar; at the back of the support of this same trunk, he found two very small filaments, which appeared to him to be analogous to the maxillary palpæ, so that the two laminæ of which the trunk is com-

posed are, according to M. Savigny, the points of the maxillæ extremely elongated, i. e. of the lower pair of grinders. Finally, the great feelers known to all naturalists are the palpæ of the lower lip. The two small maxillary feelers had been already perceived in some kinds of night-butterflies or moths; but we are indebted to M. Savigny for the information that they exist in the whole family. *Proceedings of the French Institute*, 1814.

Some of the species of butterflies are gregarious, and live in society during every stage of their existence; others live in that state during one period of their lives only. The duration of their life is various according to the weather; its warmth accelerates every step of their progress, and cold retards all their developments: a worm produced in a certain period of the summer lives only for three months, while the same species, if hatched a little later in the season, lives another year; hence Reaumur devised a method of prolonging the lives of these animals greatly beyond their natural course.

Butterflies of every species are extremely prolific; a single female at one birth produces several hundred eggs; and the most wonderful particular in the history of these insects, is the precautions by which they provide for the security of the young; some tear off the down from their own bodies to supply them with a covering.

Various insects prey upon the butterfly, or hasten the approach of its dissolution. A certain species of fly makes its way into its body, while yet a worm, and there deposits its eggs; and, although this worm continues, to live, and be metamorphosed into a *chrysalis*, no butterfly is produced from it; those internal parts that were essential to its preservation being consumed by the larvæ of the fly. From the great fecundity and variety of the insects of this genus, they probably would soon cover the surface of the earth, did not nature provide a bar to their increase; by multiplying their enemies: hence they are destined to become the food of a great number of animals of various kinds, some of which swallow them entirely, others macerate their bodies; while many accomplish their destruction by gradually sucking their juices. A single pair of sparrows, in order to supply themselves and their young, may destroy, as is supposed 3360 butterflies in a week.

The vast number of species belonging to this genus, and the variety and richness of their colouring afford ample scope to the painter for the exercise of his art. It was chiefly of these insects that Madame Merian exhibited those exquisite drawings that constitute the peculiar merit of her work. It is principally in America, the East Indies, and China, that those species are found which constitute the ornament of our collections. From the policy of the latter country, the ladies are circumscribed in their amusements; there they domesticate various species of this tribe of insects, and make their economy and manners the principal study of their lives; large glass apartments, furnished with proper food, being fitted up for the accommodation of these animals.

The papilionaceous insects in general, soon after their enlargement from the *chrysalis*, and commonly during their first flight, discharge some drops of a red-coloured fluid, more or less intense in different species. This circumstance, exclusive of its analogy to the same process of Nature in other animals, is peculiarly worthy of attention from the explanation which it affords of a phenomenon sometimes considered, both in ancient and modern times, in the light of a prodigy; viz. the descent of red drops from the air; which has been called a shower of blood: an event recorded by several writers, and particularly by Ovid, among the prodigies which took place after the death of the great dictator:

Sæpe facies visæ mediis ardere sub astris,

Sæpe inter nimbos guttæ cecidere cruentæ.

With threatening signs the lowering skies were fill'd.
And sanguine drops from murky clouds distill'd.

This

This highly-rational elucidation of a phenomenon at first view so inexplicable, seems to have been first given by the celebrated Peirese, who with his own eyes observed the vestiges of an appearance of this kind in France in the year 1608, and was clearly convinced of its real origin, viz. the discharge above mentioned from a species of butterfly, which happened during that season to be uncommonly plentiful in the particular district where the phenomenon was observed. The same idea was also entertained by Swammerdam, though he does not appear to have verified it from his own observation.

The prodigious number of species in this genus, 1157, has made it absolutely necessary to divide the whole into sections or sets, instituted from the habit or general appearance, and, in some degree, from the distribution of the colour on the wings. This division of the genus is conducted by Linnæus in a peculiarly elegant and instructive manner, being an attempt to combine, in some degree, natural and civil history, by attaching the memory of some illustrious ancient name to an insect of such or such a particular cast.

The first Linnæan division consists of the *Equites*, distinguished by the shape of their upper wings, which are longer, if measured from their hinder angle to their anterior extremity, than from the same point to the base. Some of this division have filiform or sharpened antennæ, in which particular they resemble moths, but may generally be very clearly distinguished by their habit or general shape. The *Equites* are either *Troes*, Trojans, distinguished by having red or blood-coloured spots or patches on each side their breasts; or *Achivi*, Greeks, without red marks on the breast, of gayer colours in general than the former, and often having an eye-shaped spot at the inner corner of the lower wings.

The next division consists of the *Heliconii*. These are distinguished by the narrowness of their wings, which are also, in general, of a more transparent appearance than in the other divisions; their upper wings are also generally much more oblong than the lower, which are short in proportion.

The third division is called *Parnassii*. These have the wings entire; the upper ones round.

The fourth division consists of the *Danaï*, (from the sons and daughters of Danaus.) They are divided into *Danaï candidi*, or those in which the ground-colour of the wings is generally white; and the *Danaï festivi*, in which the ground-colour is never white, and in which a greater variety of colour occurs than in the *candidi*. The wings of the Danaï are of a somewhat rounder shape than those of the *Heliconii*, or less stretched out.

The fifth section consists of the *Nymphales*, and is distinguished by the edges of the wings being scalloped or indented: it is subdivided into the *Nymphales gemmati*, in which eye-shaped spots are seen either on all the wings, or on the upper or lower pair only; and into the *Nymphales phalerati*, in which no ocellated spots are visible on the wings, but, in general, a great variety of colours.

The sixth section contains the *Plebeii*. These are, in general, smaller than the preceding kinds of butterflies, and are subdivided into *Plebeii urbicola*, or those in which the wings are marked by semi-transparent spots; and *Plebeii rurales*, in which the spots or patches have no transparency.

The arrangement made by Fabricius is upon the same principle, but something varied in the detail and subdivisions; and this last distribution is adopted by Dr. Turton in his translation of Gmelin's Linnæus. It is not our intention to insert the whole of this immense catalogue; but to select such of the species as possess any remarkable particularity, either of colour or form, and which may claim to be illustrated by the engravings which accompany the article; on which last particular it may be necessary to premise, that several of the most beautiful species have been already represented, in the course of the

work, in connexion with the plant or flower which they are known to inhabit.

I. *EQUITES*, Horsemen or Knights. *a. Troes*, Trojans.

1. *Papilio Paris*: black; wings tailed, that is, furnished with a pair of lengthened processes, black; the lower ones with a large blue spot and purple eye, and seven lunules beneath. It is found in China, and other parts of Asia; and is represented on the annexed Plate, at fig. 1.

2. *Papilio Hector*: wings tailed, black, both surfaces of the same colour; the upper pair with an uninterrupted white band; lower ones with numerous crimson spots. The thorax is red on each side. It is a native of the East Indies, and feeds on the *Aristolochia*, or birthwort.

3. *Papilio Afcanius*: wings tailed, black, with a common white band, both surfaces alike; the lower ones clouded red. It inhabits Brazil.

4. *Papilio Antenor*. This is a very large species, measuring six inches and a half in extent of wings. Its colour is black, with numerous cream-coloured spots and patches; and the under wings, which are tailed, are edged with a row of red crescent-shaped spots. It is a native of India. See fig. 2.

5. *Papilio Troilus*: wings tailed, black; the upper ones with pale marginal spots; lower ones with pale spots above, and fulvous ones beneath. Found in North America. See fig. 3.

6. *Papilio Ilioneus*: wings tailed, black; the lower ones with a bluish border, fulvous at the angle of the tail, with red spots beneath. It inhabits Georgia.

7. *Papilio Glaucus*: wings tailed, brown; the lower ones blue-black, fulvous at the angle of the tail, with yellow lunules beneath. It inhabits America.

8. *Papilio Palinurus*: wings tailed, black, with green-gold specks, and a common blue-green band. It is found at Tranquebar.

9. *Papilio Crinis*: wings tailed, black, with green-gold specks, and a common blue-green band; the lower ones beneath with green, blue, and cinereous, lunules. It is found in Africa.

10. *Papilio Deiphobus*: wings tailed, black, the base beneath spotted with red; the lower ones with seven red and almost angular spots. It is found in divers parts of Asia.

11. *Papilio Peleus*: wings tailed, black; the upper ones with a white band; the lower pair with white marginal lunules, and two red dots. It is found in India.

12. *Papilio Asterias*: wings tailed, black, with two macular bands; angle of the tail fulvous, with a deep black dot. Found in America. This is shown at fig. 4.

13. *Papilio Phorbanta*: wings tailed, black, spotted with blue; lower ones with an interrupted white band beneath. Found in the island of Cayenne.

14. *Papilio Philenor*: wings tailed, black; the lower ones with a greenish gloss, and seven eye-like spots beneath. It inhabits America. See fig. 5.

15. *Papilio Cyrus*: wings tailed, black, the margin spotted with white; lower ones with a white macular band, and marked beneath with seven red lunules. A specimen is preserved in the British Museum.

16. *Papilio Achates*: wings tailed, black, rufous at the base, both surfaces nearly of the same colour; the lower ones with a white spot divided into eight parts. It is found in China.

β. There is a variety of this species named *Papilio Alcenor*, with brown wings, black at the base; the upper ones with a rufous spot; lower ones with white spots.

17. *Papilio Priamus*: wings indented, silky; upper pair above green, with a black disk and edge; lower ones with from four to six black spots. This, says Dr. Shaw, should take the lead, not only from the corresponding dignity of the name, but from the exquisite appearance of the animal itself, which Linnæus considered as the most beautiful of the whole papilionaceous tribe. It measures more than

than six inches from wing's end to wing's end. The upper wings are velvet-black, with a broad band of the most beautiful grass-green, and of a satiny lustre, drawn from the shoulder to the tip, and another on the lower part of the wing, following the shape of that part, and of a somewhat undulating appearance as it approaches the tip; the lower wings are of the same green colour, edged with velvet-black, and marked by four spots of that colour, while at the upper part of each, or at the part where the upper wings lap over, is a squarish orange-coloured spot; the thorax is black, with sprinklings of lucid green in the middle; and the abdomen is of a bright yellow or gold-colour. On the under side of the animal the distribution of colours is somewhat different, the green being disposed in central patches on the upper wings, and the lower being marked by more numerous black, as well as orange, spots. It is a very rare insect, and is a native of the island of Amboyna.

18. *Papilio Astryanax*: wings indented, black, both surfaces of the same colour; the upper ones with a striate white band, including a smaller one; lower ones spotted with black. It is found in India.

19. *Papilio Anchises*: wings indented, black, both surfaces alike; lower ones with seven ovate scarlet spots.

20. *Papilio Sarpedon*. This is a highly-elegant species; the wings are of a lengthened shape, and the lower pair are stretched downwards into a pointed process; the whole animal is black, with a broad interrupted sea-green stripe, or band, passing through all the wings; on the lower part is also a border of crescent-shaped green spots.

21. *Papilio Polydamus*: wings indented, black, bronzed with a spotted yellow band; the lower ones with flexuous red lunules beneath. This is found on the *Aristolochia anguicida*.

22. *Papilio Æneas*: wings indented, black; upper pair with a green spot above; lower ones with a red palmate spot. It is found in India.

23. *Papilio Polymnestor*: wings indented, black, both surfaces nearly of the same colour; lower pair bluish towards the tip, and spotted with black and white. Found in divers parts of Asia.

24. *Papilio Panthous*: wings indented, black, both surfaces uniform; upper pair spotted with white; lower ones with white spots, including some black ones. It is found in India.

β. Upper wings clouded; lower ones with yellow spots.

25. *Papilio Pandarus*: wings slightly indented, both surfaces nearly alike, blackish spotted with white; lower pair yellow, with seven black eyes; the pupil blue. It inhabits India.

26. *Papilio Helena*: wings indented, black, both surfaces alike; common disk of the second pair of a brilliant gold-colour. It inhabits Surinam.

27. *Papilio Cressia*: wings indented; upper pair hyaline, with two black spots; lower ones black, with a white spot. It is found in New Holland.

28. *Papilio Harmonia*: wings scalloped, white; both surfaces alike; upper pair with a black spot; under ones with a brown margin and five white dots. It inhabits New Holland.

β. *Equites Achivi*. Greeks.

29. *Papilio Ripheus*: wings with six tail-like processes, black with green bands; lower ones with a large red patch, inclosing two black dots. It inhabits Coromandel.

30. *Papilio Leilus*: wings tailed, both surfaces alike, black with a shining green band, and numerous narrow stripes. This is an American insect.

31. *Papilio Achilles*: wings indented; above black, with a broad blue band; beneath brown, with ocellate spots. A large and beautiful species, from America. Fig. 6. Plate II. is a view of the under part; the caterpillar from which this insect is produced has been represented on the ENTOMOLOGY, Plate I. fig. 13. vol. vi.

VOL. XVIII, No. 1251.

32. *Papilio Menelaus*: wings indented; above highly polished, blue; beneath clouded brown, with ferruginous eyes. This may be considered as one of the most splendidly beautiful of the butterfly tribe. Its size is large, measuring, when expanded, about six inches; and its colour is the most brilliant silver-blue that imagination can conceive, changing, according to the variation of the light, into a deeper blue, and in some lights to a greenish cast: on the other side it is entirely brown, with numerous deeper and lighter undulations, and three large ocellated spots on each wing. It is a native of South America, and proceeds, according to Madame Merian, who has figured it in her work on the Surinam Insects, from a large yellow caterpillar, beset with numerous upright sharp black spines. It changes into an angular chrysalis, of a brown colour, and distinguished by having the proboscis projecting in a semicircular manner over the breast: from this chrysalis, in about fourteen days, proceeds the complete insect, as represented at fig. 7.

33. *Papilio Ulysses*: wings tailed, black, with a blue radiating disk; lower pair with seven ocellate spots beneath. This species is found in Asia.

34. *Papilio Diomedes*: wings tailed, black; the disk unequally radiate with blue; the lower ones with blue lunules. It inhabits India.

35. *Papilio Podalirius*: wings tailed, both surfaces nearly alike, yellowish, with double brown bands and margin; lower ones with five blue ocellate spots, and a reddish line beneath. This is found in our own country, and other parts of Europe. Mr. Donovan has given a representation of it, which we have copied at fig. 8.

36. *Papilio Sinon*: wings tailed, black, with green entire band, stripes, and dots; lower ones with a red line underneath. It is found in India, and is half the size of the *Podalirius*.

37. *Papilio Chiron*: wings tailed, black, barred with brown; underneath white, on the fore part with ferruginous streaks. It inhabits India.

38. *Papilio Melibœus*: wings tailed, brown; upper pair with a red stripe, lower ones with two; beneath shining blue. It inhabits Surinam.

39. *Papilio Homerus*: wings tailed, black, with a yellow band; lower ones yellowish underneath, with seven eyes. It inhabits America.

40. *Papilio Machaon*. This is an insect of great beauty, and may be considered as the only British species of *Papilio*, excepting the *Podalirius*, belonging to the tribe of Equites. It is commonly known among the English collectors by the title of the *swallow-tailed butterfly*; and is of a beautiful yellow, with black spots or patches along the upper edge of the superior wings; all the wings are bordered with a deep edging of black, decorated by a double row of crescent-shaped spots, of which the upper row is blue, and the lower yellow. See fig. 9. The under wings are tailed, and are marked at the inner angle or tip with a broad red spot, bordered with blue and black. The larva, or caterpillar, of this species, feeds principally on fennel, and other umbelliferous plants; and is sometimes found on rue. It is of a green colour, encircled with numerous black bands, spotted with red; and is furnished on the top of the head with a pair of short tentacula of a red colour, which it occasionally protrudes from that part. In the month of July it changes into a yellowish-grey angular chrysalis, affixed to some part of the plant, or other neighbouring substance; and from this chrysalis, in the month of August, proceeds the complete insect. It frequently happens that two broods of this butterfly are produced in the same summer; one in May, having been in the chrysalis state all the winter; the other in August, from the chrysalides of July.

41. *Papilio Theristes*: wings tailed, yellow, with a black border; lower ones with yellow lunules. It is found in America. A specimen is found in Dr. Hunter's museum.

42. *Papilio Ajax*: wings tailed, both surfaces alike, brown

brown with yellow bands; lower ones beneath with red streaks, and fulvous at the angle of the tail. Found in North America.

43. *Papilio Agamemnon*: wings tailed; black spotted with green; lower ones with three rufous lunules beneath. It inhabits Asia.

44. *Papilio Orestes*: wings slightly tailed, above black, beneath yellowish, all of them with a snowy disk and two black bands. It inhabits Africa.

45. *Papilio Pylades*: wings indented, snowy, with a black border dotted with white; angle of the tail with a rufous eye. This also is an African insect.

46. *Papilio Tyndareus*: wings indented, black spotted with green; lower ones varied beneath with green, brown, and red, the base dotted with black.

47. *Papilio Œdipus*: wings very entire, above black, immaculate; beneath brown, with about three eyes on the upper, and five on the lower, ones. It inhabits Russia.

48. *Papilio Phocion*: wings entire, above brown, immaculate; lower ones beneath with yellow streaks, and three oblong eyes. It is preserved in the British Museum.

49. *Papilio Terminus*: wings entire, brown, with a rufous patch; upper pair with a single eye above, lower ones with four. Found in New Holland. A specimen is preserved in the museum of the late sir Joseph Banks, bart. president of the Royal Society, whose recent death the friends of science have great cause to lament.

II. HELICONII. Upper wings oblong; lower ones rounded.

50. *Papilio Horta*: wings entire, red, upper one hyaline at the tip, lower ones beneath whitish dotted with black. This is an inhabitant of Africa.

51. *Papilio Quirina*: wings entire, hyaline; disk of the lower pair fulvous, specked with black. This is found at Madrás. See Plate III. fig. 10.

52. *Papilio Calliope*: wings entire, yellow; upper pair with three black streaks; lower ones with three black bands. It inhabits India.

53. *Papilio Terpicore*: wings entire, fulvous; lower pair dotted with black. It inhabits Asia.

54. *Papilio Polymnia*: wings entire; upper pair with black spots, and tip and yellow band; lower ones with three black bands, the middle one ferrate. This is found in America.

55. *Papilio Hippodamia*: wings entire, upper pair black, with three hyaline bands; the lower ones are likewise hyaline.

56. *Papilio Irene*: upper wings black, with yellow spots, and a fulvous line at the base; lower ones fulvous, edged with black. It inhabits America.

57. *Papilio Sappho*: wings entire, both surfaces alike, black-blue; upper pair with a white band; lower ones edged with white. Inhabits Jamaica.

58. *Papilio Urania*: wings entire, brown, with a white disk; lower ones with two eyes each. This is found in India.

59. *Papilio Thales*: wings nearly entire, and alike on both surfaces, black, with red rays at the base; the upper pair is spotted with yellow. It inhabits Surinam.

60. *Papilio Aspasia*: wings entire, black, with hyaline streaks and spots; lower ones yellow at the base. It inhabits Tranquebar.

61. *Papilio Melpomene*: wings entire, black; upper pair with a red band; lower ones with red dots at the base beneath. It inhabits America.

62. *Papilio Clio*: wings entire, brown; upper pair spotted with white; lower ones with a white band. It inhabits America. This species is represented on the lower part of the engraving of MULLER, vol. xvi. being an inhabitant of that plant.

63. *Papilio Thalia*: wings entire, brown; upper pair spotted with yellow; lower ones striate. It inhabits India.

64. *Papilio Camoena*: wings nearly entire, brown; dotted with black; lower ones with a red band. It inhabits Africa; and is represented at fig. 11. of the annexed Plate.

65. *Papilio Persphone*: wings entire, brown dotted with black; upper pair with a white spot; margin of the lower ones black, immaculate.

66. *Papilio Parrhasia*: wings entire, black; upper pair with a four-cleft fulvous and hyaline spot; lower ones with a fulvous band, beneath yellow with black dots and lines.

67. *Papilio Pasiphae*: wings entire, brown, varied with white, with black spots and margin. It inhabits Guinea.

68. *Papilio Marcia*: wings entire; upper pair brown, immaculate; lower ones yellowish, dotted with black. This, and also the two next, are found in Africa; and specimens are preserved in sir Joseph Banks's museum.

69. *Papilio Cœcilia*: wings white, in the middle dotted with black; margin of the lower ones black; beneath it is dotted with white.

70. *Papilio Euterpe*: wings entire, black, with a fulvous band and white dots. It inhabits America.

71. *Papilio Erato*: wings entire, black; upper pair spotted with yellow and red at the base; lower ones are striate with red. This is found in India.

III. PARNASSII. Wings entire; the upper ones rounded.

72. *Papilio Apollo*: wings entire, white, spotted with black; lower ones with four eyes above and six beneath. This is a native of many parts of Europe, but has not been observed in these islands. It is something larger than the common great cabbage-butterfly. The caterpillar is black, with small red spots, and a pair of short retractile tentacula in front; it feeds on orpine and some other succulent plants, and changes into a brown chrysalis, covered with a kind of violet-coloured powder.

73. *Papilio Phœbus*: wings entire, both surfaces alike, white spotted with black; lower ones with three red spots circled with black. It is found in the wilds of Siberia.

74. *Papilio Mnemosyne*: wings entire, white, with black nerves; upper pair with two black marginal spots. It inhabits Europe.

75. *Papilio Cratægi*: wings entire, white, with black veins. This is sometimes called the *hawthorn-butterfly*, and is well known in this country. It is of the size of the common cabbage-butterfly, and is seen in the months of June and July. See the Plate, fig. 12.

76. *Papilio Andromache*: wings entire, both surfaces alike, dotted with black; the upper pair is dusky and naked; the lower ones yellowish. It is found in New Holland.

77. *Papilio Mandane*: wings oblong, entire; the upper pair is hyaline, with black veins; the lower ones black, with a white band. It inhabits Africa.

78. *Papilio Piera*: this species has semi-transparent wings, the lower pair marked with two ocellated spots. See fig. 13. It is a native of South America.

79. *Papilio Nereis*: wings scalloped, brown; lower ones with a snowy band; the disk is fulvous, with two black eyes. It inhabits America.

80. *Papilio Andromeda*: wings hyaline, white; lower ones red at the tip, with a single eye in each. It is found in India. See fig. 14.

81. *Papilio Diaphanus*: wings entire, hyaline, white; the margins brown. It inhabits Jamaica. See fig. 15.

IV. DANAI. *a. candidi*; wings mostly white.

82. *Papilio brassicae*: wings rounded, entire, white; the tips of the upper pair brown; and, in the male, there are two black spots in the middle of each wing. This, which is shown at fig. 16, is the common large white butterfly known in our gardens; it proceeds from a yellowish caterpillar freckled with bluish and black spots, and which changes during autumn into a yellowish-grey chrysalis, affixed

affixed in a perpendicular direction to some wall, tree, or other object, some filaments being drawn across the thorax, in order the more conveniently to secure its position. The fly appears early in the spring, and is seen almost through the summer.

83. *Papilio rapæ*: wings entire, white; upper pair tipped with brown; male with a brown spot on each; female with three brown spots on the upper, and one on the lower, pair. This is common in our own country. See fig. 17.

84. *Papilio Castalia*: wings entire, white; above immaculate, beneath yellowish at the base. A native of India.

85. *Papilio Sylvia*: wings entire, white; tip of the upper pair brown, with a fulvous spot beneath. Inhabits Sierra Leone. A specimen is in Sir Joseph Banks's museum.

86. *Papilio Argante*: wings entire, fulvous; beneath speckled with ferruginous. It inhabits Brasil.

87. *Papilio Argia*: wings entire, white; upper pair black at the tip. It inhabits Sierra Leone.

88. *Papilio Nephte*: wings scalloped, white; upper pair edged with black. This is shown at fig. 18. It inhabits China.

89. *Papilio Amathonte*: wings rounded, white tipped with black; margin of the upper pair beneath nut-brown. Inhabits America.

90. *Papilio Phileta*: wings entire, grey; upper pair above white, tipped with brown. It is a native of America.

91. *Papilio Libythea*: wings entire, white; upper pair brown at the base of the rib, and at the tip. Found in India.

92. *Papilio Calypso*: wings entire, upper pair with a black dot and tip; lower ones beneath yellowish, the margin dotted with black. This is a native of Sierra Leone.

93. *Papilio Daplidice*: wings entire, white, with a brown margin, beneath marked with yellowish-white and green. It inhabits Europe and Africa, and is common here.

94. *Papilio Cneora*: wings entire, white; the margin black, with a streak of dots. It inhabits India.

95. *Papilio Nerissa*: wings entire, white, with a black margin; beneath with black veins. It is a native of China.

96. *Papilio Demophile*: wings white, with two brown bands and margin; lower ones beneath flesh-colour. It inhabits India.

97. *Papilio Vanessa*: wings entire, white; upper pair with a brown exterior margin and black dot; lower ones with brown streaks. It inhabits America.

98. *Papilio Hecabe*: wings entire, yellow; the outer margin black; beneath dotted with brown. A native of India.

99. *Papilio Agave*: wings entire, yellow; tip of the upper pair above black; beneath chestnut-brown. It is found at Cayenne.

100. *Papilio Cardamines*: wings entire, white; upper pair of the male, with a large bright orange patch, including two black; the lower ones beneath marbled with green; the female is without the orange tip. See fig. 19.

101. *Papilio Dorothea*: wings entire, white; upper pair black at the tip; lower ones beneath with yellow bands, speckled with black.

102. *Papilio Nina*: wings entire, white; upper pair with a black spot and tip; lower ones beneath speckled with green. This is an Indian insect.

103. *Papilio Nyfa*: wings entire, white; the lower ones beneath brown, with a white dot and six yellow lunules. It is a native of New Holland.

104. *Papilio Muta*: wings entire, white; lower ones with a black dot in the middle; beneath yellow, with two black dots. It is found in many parts of India.

105. *Papilio Chloris*: wings entire, white, tipped with black; lower ones beneath fulvous with a broad black margin. This is an African insect.

106. *Papilio Rhodope*: wings entire, white, both surfaces nearly alike; upper pair yellow; lower ones white; all black on the outer margin. It is found in Sierra Leone.

107. *Papilio Leucippe*: wings entire; upper pair red, edged with black; lower ones yellow. It is a native of Amboyna.

108. *Papilio Glaucippe*: wings entire, white; upper pair tipped with black; lower ones beneath cinereous, with brown waves. It is found in Asia.

109. *Papilio Eudoxia*: wings entire, white, edged with black; beneath fulvous at the base and spotted with black at the margin. This is found in Sierra Leone.

110. *Papilio Danaë*: wings white; upper pair saffron at the tip, with a black band and margin; beneath with an abbreviated moniliform streak.

111. *Papilio Enippe*: wings yellow; underneath they have a yellow ocellar brown dot; on the upper pair six, on the lower ones seven. It inhabits China.

112. *Papilio Evippe*: wings entire, yellowish; upper pair tipped with black; lower ones white beneath. It is found in Asia.

113. *Papilio Charmione*: wings entire, both surfaces alike, white with a black border; which on the upper wings has two yellow spots, and one on the lower. A native of Johanna island.

114. *Papilio Phronima*: wings entire, white; base of the rib and tip black; lower ones beneath yellowish, with two darker bands. This and the next are natives of America.

115. *Papilio Psamathe*: wings entire, white; tip of the upper pair black spotted with white; lower ones beneath greenish with two darker bands, the foremost incurved.

116. *Papilio Hyale*: wings entire, yellow, the tip black, spotted with white; lower ones with a fulvous spot, a silvery dot, with a smaller contiguous one beneath. In the male, the margin of the wings is immaculate; in the female it is spotted.

117. *Papilio Nicippe*: wings entire, fulvous tipped with brown; upper pair with a black lunule on each side; the lower ones beneath speckled with red. This is found in Virginia.

118. *Papilio Eubule*: wings entire, yellow, the margin dotted with black; the lower ones beneath with a double silvery ferruginous dot. A native of Carolina.

119. *Papilio Rhamni*: wings entire, angular, yellow; each with a dot in the middle. A handsome insect; an inhabitant of Europe; shown at fig. 20.

β. Danai feliivi; wings variegated.

120. *Papilio Cypris*: wings entire, black, with two white bands; those of the upper pair oblique, of the lower ones punctate. It inhabits America.

121. *Papilio Diocletianus*: wings entire, black; upper pair with an interrupted white band; lower ones with white lines at the base, and a double row of dots at the tip. A native of the East Indies.

122. *Papilio Claudius*: wings entire, black; upper pair with a blue gloss, and dotted with white; lower ones with white lines. It inhabits Tranquebar.

123. *Papilio Damocles*: wings entire; upper pair black; lower ones brown with a white disk. It inhabits Asia and Africa.

124. *Papilio Radamanthus*: wings entire, black, with a blue gloss; upper pair with a marginal white spot; the lower ones with a white spot and four lines. It is a native of Asia.

125. *Papilio Zoilus*: wings entire, black; upper pair with three white spots, lower ones with a white disk. It is a native of New Holland.

126. *Papilio Syphax*. In this the wings are entire and black; the upper pair has a white band, the lower ones a marginal red one.

127. *Papilio Evalthe*: wings entire, black; upper pair with two yellow bands; the lower ones are marked with a yellow

a yellow band and red spots, beneath red with a yellowish macular band. It is a native of India.

128. *Papilio Phalaris*: wings entire and brown; the lower pair with two macular white streaks.

129. *Papilio Galanthis*: wings entire; above black, with fangineous bands; upper pair with two white dots at the tip.

130. *Papilio Hesperus*: wings scalloped, brown with black waves; upper pair with white dots.

131. *Papilio Archippus*: wings scalloped, fulvous, with black veins, the margin black, dotted with white; upper pair with fulvous spots at the tip. It is a native of America.

132. *Papilio Plexippus*: wings entire, fulvous, with dilated black veins; the margin black, with white dots; upper pair with a white band at the tip. It inhabits America.

133. *Papilio Eriippus*: wings entire, dull testaceous, the edge black dotted with white; disk of the lower ones immaculate, beneath with black veins and white dots. A native of China.

134. *Papilio Mifippus*. The wings of this are scalloped, and fulvous; the edge black, dotted with white; lower ones with a black curve. Found in America.

135. *Papilio Chrysippus*: wings entire, fulvous; the margin black, dotted with white; disk of the lower ones white, with black dots. See fig. 21.

136. *Papilio Alcippus*: wings entire, fulvous; the margin black, dotted with white; disk of the lower ones white, with black dots. Native of America.

137. *Papilio Diocippus*: wings scalloped, fulvous, with a common black border dotted with white; lower ones beneath with three black dots, and a streak of white ones behind. It inhabits India.

138. *Papilio Gilippus*: wings entire, both surfaces alike, fulvous spotted with white; the margin black, with white dots. It inhabits America.

139. *Papilio Hegefippus*: wings entire, both surfaces alike, black spotted with white; base of the upper pair fulvous, of the lower ones with white lines.

140. *Papilio Darius*. The wings are entire, brown; upper pair spotted with white, lower ones with a black curve beneath. It inhabits Brasil.

141. *Papilio Codomannus*. The wings entire, black, with red bands; lower ones beneath with angular yellow lines and blue dots. It inhabits Brasil.

142. *Papilio Hydaspes*: wings entire, brown, with a blue gloss; lower ones beneath yellow, with annular black lines, and three blue dots. A native of Brasil. A specimen is preserved in sir Joseph Banks's museum.

143. *Papilio Jaius*: wings entire, brown; disk of the lower ones white, with a blue eye above, and two beneath. A native of India.

144. *Papilio Orion*: wings scalloped; upper pair falcate, rufous; the tip black, with a marginal white spot. Found at Surinam.

145. *Papilio Cocytus*: wings falcate; above black, the hind margin cinereous. It inhabits Siam; and a specimen is in sir Joseph Banks's museum.

146. *Papilio Odin*: wings entire, dusky, with a single angle; lower ones beneath with a pair of black sub-ocellate dots on each side. It inhabits China.

147. *Papilio Dido*: wings indented, oblong, black, spotted with green; lower ones with a bluish band, and seven transverse spots. It is a native of America.

148. *Papilio Eurinome*: wings indented, black spotted with white; lower ones white at the base. It inhabits India: so also do the two following.

149. *Papilio Philomela*: wings scalloped, black spotted with white; lower ones radiate, with yellow at the base.

150. *Papilio Lais*: wings indented, black, with bluish stripes, beneath brown. Found in India.

151. *Papilio Enothrea*: wings indented, black, with a green disk; beneath black, with a white costal dot. It inhabits Sierra Leone.

152. *Papilio Hippias*: wings scalloped, greenish-white, with black border and veins.

153. *Papilio Panope*: wings indented, brown, both surfaces alike, the outer margin spotted with white; angle of the tail fulvous. This and the next are natives of India.

154. *Papilio Jacintha*: wings scalloped, toothed, brown; upper pair with a streak of white dots, lower ones white at the tip.

155. *Papilio Juno*: wings angular, indented, oblong, fulvous, with a black border; lower ones beneath black, with fulvous and silvery spots. Found at Surinam.

V. NYMPHALES. Wings denticulate; the lower ones forming a groove for the reception of the abdomen.

156. *Papilio Jafius*: wings two-tailed, brown, yellowish behind; beneath with a white band. Found in different parts of Africa.

157. *Papilio Pyrrhus*: wings tailed, brown, with a common white band, reaching half-way on the upper pair. It is a native of India.

158. *Papilio Camillus*: wings two-tailed, white, with fulvous bands edged with black; lower ones with a black caudal spot. It is found in Africa, and is in sir Joseph Banks's museum.

159. *Papilio Sempronius*: wings two-tailed, white, the margin black, dotted with white.

160. *Papilio Tiridates*: wings indented, two-tailed, above black spotted with blue; the margin is dotted with white. It inhabits Amboyna.

161. *Papilio Castor*: wings indented, two-tailed, fulvous edged with black; beneath with a white band and white spots, including a black one. This and the next are found in Guinea.

162. *Papilio Pollux*: wings indented, two-tailed, brown with a yellow band; beneath with a white band and spots, including a black one.

163. *Papilio Fabius*: wings indented, two-tailed, brown with yellow bands; the base beneath with black waves; the tip with fulvous dots. It inhabits India, and is in the museum of sir Joseph Banks.

164. *Papilio Miltiades*: wings tailed, brown; lower ones with a white spot, all beneath with a white band and single eye.

165. *Papilio Varanes*: wings tailed, above brown with fulvous and black spots; the base is white. It is an Indian insect.

166. *Papilio Themistocles*: wings tailed, chestnut-brown with brown bands; lower ones with black dots.

167. *Papilio Perianther*: wings tailed, both surfaces alike, white with yellow bands; the tip brown, streaked with white. It is a native of India, and is in the collection of sir Joseph Banks.

168. *Papilio Lycurgus*: wings tailed, black with blue marginal lunules; behind these are five white dots on the lower ones. It is a native of Africa.

169. *Papilio Decius*: wings tailed, with a common white band; lower ones rufous at the tip, with two eyes and two white dots. It is found in Guinea.

170. *Papilio Sabinus*: wings tailed, brown, with a fulvous band; beneath grey, with a white band and ocellar dots. It inhabits Amboyna.

171. *Papilio Palamedes*: wings tailed, black, with yellow marginal lunules; upper pair with a yellow band; lower ones with a macular rufous band. It is found in America; and is in the collection of Dr. Hunter.

172. *Papilio Orontes*: wings tailed, black, with two greenish bands; the tail is white and distant. It is a native of India, as is also the next.

173. *Papilio Ægistus*: wings tailed, undulate with brown and yellow, and about three caudal eyes.

174. *Papilio Solon*: wings tailed, black, with yellowish bands, brown at the base.

175. *Papilio Empedocles*: wings tailed, brown; upper pair with an abbreviated macular green band; lower ones beneath

beneath with two black spots, and a rufous lunule at the angle of the tail. It is a native of India, and in the collection of sir Joseph Banks.

176. *Papilio Euryalus*: wings tailed, black; lower ones blue before the margin, with black spots, including a white pupil. It inhabits Amboyna, as does the next.

177. *Papilio Nifus*: wings tailed, black; upper pair with a fulvous band; lower pair with a submarginal white one.

178. *Papilio Laertes*: wings tailed, brown, blue at the base; lower ones above with five white dots, beneath with four ocellar dots. Found in Surinam.

179. *Papilio Erithronius*: wings indented, black; lower ones with a blue band; beneath green, with a streak of white dots. It inhabits Africa; and is in the museum of Dr. Hunter.

180. *Papilio Ceres*: wings indented, black; upper pair with a white band; disk of the lower ones bluish, with a black dot. It inhabits Sierra Leone.

181. *Papilio Cato*: wings indented, black, with a common greenish disk beneath, dotted with black, and a rufous spot at the base of the lower ones. It inhabits Sierra Leone.

182. *Papilio Philoctetes*: wings indented, brown; lower ones with two eyes, the pupil black, and three white dots. It is found in India, as is the next.

183. *Papilio Lucretius*: wings indented, black, with fulvous bands; beneath with black spots, surrounded with a blue line. Found in Guinea.

184. *Papilio Demophon*: wings indented, above black, with a green band; beneath grey, streaked with white. Inhabits Cayenne. See Plate IV. fig. 22.

185. *Papilio Nestor*: wings indented, brown, with a bright blue common disk, and white spots; beneath with three or four eyes. This species inhabits America.

186. *Papilio Telemachus*: wings indented, brown, with a common blue radiate area, each with eyes beneath. A native of America. See fig. 23.

187. *Papilio Teucer*: wings scalloped, livid brown; beneath clouded, and on the lower ones three eyes, the last very large.

188. *Papilio Automedon*: wings angular, scalloped, brown; beneath livid, with an eye at the angle of the tail. Inhabits Surinam.

189. *Papilio Io*, the peacock-butterfly; so called on account of its great beauty. It is rather a common species in this country. The wings are angular, indented, fulvous, spotted with black, and on each there is a large blue eye. "The ground colour of this insect," says Dr. Shaw, "is orange-brown, with black bars, separated by yellow intermediate spaces, on the upper edge of the superior wings; while at the tip of each is a most beautiful large eye-shaped spot, formed by a combination of black, brown, and blue, with the addition of whitish specks; on each of the lower wings is a still larger eye-shaped spot, consisting of a black central patch, varied with blue, and surrounded by a zone of pale-brown, which is itself deeply bordered with black. The caterpillar is black, with numerous white spots, and black ramified spines: it feeds principally on the nettle, changing to a chrysalis in July, and the fly appearing in August." See fig. 24.

190. *Papilio Almanax*: wings angular, fulvous, spotted with black; lower ones with a larger eye, and a double pupil; all nut-brown beneath. It inhabits Asia. See fig. 25.

191. *Papilio Oenone*: wings denticulate, yellow, edged with black; lower ones blue at the base. This is an Asiatic insect. Fig. 26.

192. *Papilio Ægeria*: wings indented, brown spotted with yellow, upper pair with an eye on each side; lower ones with four eyes above, and dots beneath. This belongs to England, and is described in Lewin's Butterflies. See fig. 27.

193. *Papilio Minerva*: wings indented, fulvous, the tip black, spotted with white; lower ones with five blind

eyes above, and seven pupillate ones beneath. It is a native of America.

194. *Papilio Ocirrhe*: wings indented; above white tipped with brown, beneath brown with two white bands; lower ones with five eyes. A native of Surinam.

195. *Papilio Penelope*: wings slightly indented, brown, with a single eye; lower ones with two beneath. It is found in Surinam.

196. *Papilio Aranea*: wings slightly indented, brown; lower ones bluish, with five eyes beneath. This is found in Surinam.

197. *Papilio Merope*: wings indented, fulvous, with a single eye, and black tip; lower ones beneath cinereous, with three minute eyes. It inhabits New Holland: a specimen of it is in the museum of sir Joseph Banks.

198. *Papilio Artemisia*: wings indented, black; upper pair with white spots, lower ones with white bands, and two silvery eyes beneath. It inhabits America.

199. *Papilio Ianthé*: wings indented, above brown slightly barred with white, lower ones with five blind eyes. It inhabits Cayenne.

200. *Papilio Huntera*: wings subangular, fulvous varied with white and black; lower ones beneath reticulate with white, and with two eyes.

201. *Papilio Blomfieldia*: wings indented, yellow, tipped with black; lower ones beneath brown, waved with white, with four eyes, the middle ones blind. It inhabits Brazil. Specimens of this and the two next are in the museum of sir Joseph Banks.

202. *Papilio Bankia*: wings angular, above brown; disk of the upper pair yellowish, with a black eye, in which is a double pupil. It inhabits New Holland.

203. *Papilio Solandra*, wings angular, brown; upper pair with an eye, and also a contiguous one that is smaller; lower ones with two above and four beneath. It inhabits Otaheite.

204. *Papilio Leda*: wings angular, brown, upper pair with a double eye above, beneath reticulate with grey, and six eyes on the lower ones. It inhabits Sierra Leone.

205. *Papilio Lena*: wings slightly indented, brown; lower ones black behind, with white and blue dots, and eyes beneath. There is a variety with brown hyaline wings, the lower ones with five ocellar white spots. It is found at Cayenne.

206. *Papilio Luna*: wings indented, brown, with darker streaks; lower ones with two eyes, and they all have underneath four white dots.

207. *Papilio Iris*: wings indented, brown, with a blue gloss, and whitish interrupted band on each side; all with a single eye, those on the upper pair above blind. This is described and figured by Donovan and Lewin. See fig. 28.

208. *Papilio Chrysippe*: wings indented, black, with a common rufous patch; lower ones beneath brown, spotted with black. This is a native of New Holland, and is preserved in sir Joseph Banks's collection.

209. *Papilio Cidippe*: wings indented, black, with white spots, and a common rufous patch; the base beneath is testaceous, varied with black and blue. A native of India.

210. *Papilio Penthesilea*: wings indented, black, with white spots, and a common rufous patch; lower ones beneath with yellow bands, and a white one spotted with black. It is a native of India.

211. *Papilio Berenice*: wings indented, black, with a common red band; lower ones beneath spotted with black, white, ferruginous, and yellow. Inhabits Sierra Leone.

212. *Papilio Atalanta*: wings indented, black; upper pair with a red band and white spots, the lower ones bordered with red behind. This, as the *admirable butterfly*, has been described and figured by Donovan, Lewin, and Dr. Shaw; the latter says "it is of the most intense velvet-black colour, with a rich carmine-coloured bar across

the upper wings, which are spotted towards the tips with white; while the lower wings are black, with a deep border of carmine colour, marked by a row of small black spots; the under surface of the wings also presents a most beautiful mixture of colours; the caterpillar is brown and spiny, feeds on nettles, and changes into a chrysalis in July, the fly appearing in August." See fig. 29.

213. *Papilio Urticæ*: wings angular, fulvous spotted with black; upper pair with three black dots, the inner one square. It inhabits this country, and has been described and figured by Donovan and Lewin. The larva is spinous, varied with brown and green, head black; pupa toothed, brown with gold dots. This insect and many others of the same genus, as the *Atalanta*, *Polychloris*, *Io*, &c. soon after their enlargement from the chrysalis state, discharge a few drops of reddish-coloured fluid, which, in places where they have appeared in large numbers, has had the appearance of a shower of blood, and, having of course been greatly magnified, the fact has been recorded by writers as a prodigy ominous of some extraordinary event. See fig. 30.

214. *Papilio Clytemnestra*: wings angular, black; beneath spotted with white; upper pair with a yellow band on each side. Inhabits Surinam.

215. *Papilio Dirce*: wings angular, brown; upper pair with a yellowish band, beneath undulate with black. Found in various parts of India, as is the next species.

216. *Papilio Iſis*: wings indented; upper pair black, with a red spot on the disk; all of them with green lines beneath.

217. *Papilio Progne*: wings indented, fulvous, with black dots and margin, the latter dotted with white; beneath grey. Found in South America.

218. *Papilio Ariadne*: wings angular, fulvous, with undulate black streaks; upper pair with a white marginal dot. Found in the island of Java.

219. *Papilio Clytia*: wings indented, black; outer margin of the upper pair spotted with white; lower ones with a triple row of white and yellow spots. This and the next are natives of India.

220. *Papilio Cocytia*: wings scalloped, indented, brown; lower ones bluish at the tip. It inhabits India.

221. *Papilio Meleagris*: wings slightly indented, dotted with white, above brown, beneath yellowish. It inhabits Africa.

222. *Papilio Melantha*: wings indented, above brown dotted with white, beneath pale chestnut. It inhabits Guinea. A specimen is to be seen in Sir J. Banks's museum.

223. *Papilio Leucothoe*: wings indented, above brown, with three white bands; beneath yellow, with three white bands marked with black. It is found in divers parts of Asia.

224. *Papilio Medea*: wings indented, falcate, black, with three macular yellow bands; angle at the tail red. A native of Surinam.

225. *Papilio Blandina*: wings indented, above brown, beneath yellow, with two blue streaks and dots marked with black on the lower ones. This and the next are found in Sierra Leone.

226. *Papilio Hostilia*: wings indented, brown; the base fulvous dotted with black; upper pair spotted with yellow at the tip.

227. *Papilio Nauplia*: wings slightly indented, both surfaces nearly alike, black; upper pair with four white spots above, lower ones with a white band. It inhabits South America.

228. *Papilio Amphione*: wings indented, black clouded with blue; upper pair with a white band on each side; lower ones beneath radiate with red. It inhabits South America.

229. *Papilio Alcmena*: wings indented, black, with an interrupted blue band, each with seven white marginal dots.

230. *Papilio Agatha*: wings indented, above fulvous, beneath glaucous, lower ones with one black dot above, and three beneath.

231. *Papilio Laura*: wings angular, indented, brown, with a common band, which is fulvous on the upper half, and snowy on the lower; lower ones beneath silvery with a snowy band. It inhabits Jamaica.

232. *Papilio Lydia*: wings indented, yellow, black above the margin; beneath with a streak of black dots. It inhabits Surinam.

233. *Papilio Iphicla*: wings indented, above brown, with a common white ferruginous spot at the angle of the tail. Found in South America.

234. *Papilio Veronica*: wings indented, above greenish, beneath ferruginous, with a paler band. It is found in Guinea.

235. *Papilio Nærea*: wings indented, above brown, spotted with white beneath, with white spots surrounded with a red line. There is a variety of this species, wings slightly tailed, black; upper pair with two red spots, disk of the lower ones edged with red. Natives of India.

236. *Papilio Procris*: wings indented, fulvous, with black spots and a white band, beneath variegated. Inhabits China.

237. *Papilio Erymanthis*: wings indented, fulvous; upper pair black at the tip, with a yellow band; lower ones with black lunules above, and a streak of ocellate dots beneath. Inhabits China.

238. *Papilio Celtis*: wings angular, indented, brown, with fulvous spots, and a single white one; lower ones beneath grey. Found in southern Europe, on the leaves of the *Celtis Australis*, or European nettle-tree. Three different sizes and ages of the caterpillar are noticed and figured by Fuesly. At every change their colours alter. Passing to the chrysalis state, they hang themselves perpendicularly from a leaf; in this state they were first green, afterwards darker, which announced the approaching birth of the butterfly: the wings, within an hour of their coming forth, acquired all their firmness.

239. *Papilio Melissa*: wings indented, brown; lower ones beneath marbled with grey. It is found in America.

240. *Papilio Paphia*. This is an highly-elegant insect, of a fine orange-chestnut colour above, with numerous black spots and bars, beneath greenish, with narrow silvery undulations on the lower wings, and black spots on the upper. It proceeds from a yellowish-brown spiny caterpillar, living principally on nettles. This insect is generally found in the neighbourhood of woods. See fig. 31.

241. *Papilio Cytheræa*: wings crenate, brown; upper pair with a fulvous band; lower ones with a common silvery one; beneath with a lanceolate silvery band. It is found in India.

242. *Papilio Aglaia*: wings indented, fulvous, spotted with black; beneath it has twenty-one silvery spots. This is found in England and other parts of Europe.

243. *Papilio Cybele*: wings indented, fulvous, spotted with black; beneath thirty-four silvery spots.

244. *Papilio Idalia*: wings indented, fulvous, spotted with black; beneath with thirty-seven silvery spots.

245. *Papilio Diana*: wings indented, brown, with a common black disk; lower ones beneath with nine silvery spots.

246. *Papilio Adippe*: wings indented, fulvous, spotted with black; beneath (in the female only) there are twenty-eight silvery spots. This is an English insect; and has been called the *great pearl-butterfly*, but Fuesly ascertained that the female only can claim that name: "Large veins spread upon the upper surface of the upper wings, and the want of a line of silvery spots at the lower part of the under wings," are the peculiar characters of the male. When the worm or caterpillar has attained the full size, it passes into chrysalis state. It has been generally called the *violet-worm*, but it is now said to inhabit

only the pansy, *Viola tricolor*. It weaves a covering for itself, and remains suspended by the tail; but it previously winds some threads round its own body, probably to keep off flies and the ichneumon-insect, which are its enemies. De Geer has omitted to notice this circumstance. The butterfly appears in its perfect state at the end of a fortnight. Finally, from whom the above particulars are taken, begins his "Archives upon the History of Insects" with a Dissertation upon this species. It was long supposed to be a variety of the *P. Aglaia*.

247. *Papilio Euphrosyne*: wings indented, pale, fulvous spotted with black; beneath with nine silvery spots.

248. *Papilio Selene*: wings indented, fulvous, spotted with black; lower ones beneath, with twelve silvery spots; a distinct black dot at the base and streak behind. This is found at Kiel.

249. *Papilio vanillæ*: wings indented, yellow spotted with black; thirty silvery spots beneath. Inhabits America, chiefly on the plant called *Epidendrum vanilla*, whence the name. This butterfly is shown in its perfect state on the ENTOMOLOGY, Plate I. fig. 6. vol. vi. two of its fecundated eggs are shown magnified at fig. 9. and at fig. 11. Plate II. is represented the caterpillar of the same.

250. *Papilio Sophoræ*: wings entire, brown, with a ferruginous band; lower ones beneath chestnut-brown, with two eyes. It inhabits America; and is represented on the upper part of the engraving of MULLER, vol. xvi.

VI. PLEBEII, or Common People. *a. rurales*, of the country.

251. *Papilio Cupido*: lower wings six-toothed; tailed; beneath whitish, with silvery spots. It inhabits America.

252. *Papilio Cnidus*: wings six-toothed, tailed, white, with a black border; lower ones with silvery spots beneath. A native of Surinam.

253. *Papilio Pythagoras*: wings three-tailed, with a yellow border; beneath black, varied with white, and a white band in the middle. It inhabits India.

254. *Papilio Amor*: wings three-tailed, brown, the disk beneath variegated, and a golden streak behind on the lower ones. It inhabits India.

255. *Papilio Hesioidus*: wings three-tailed, black with a blue disk, beneath white, with a common greenish streak, and two silvery dots at the angle of the tail. It is found in India.

256. *Papilio Timon*: wings three-tailed, greenish at the base; beneath white, with an abbreviated red band on the lower ones. It inhabits America; a specimen is in Dr. Hunter's museum.

257. *Papilio Faunus*: wings three-tailed, brown, beneath white, with two fulvous streaks. It inhabits Africa.

258. *Papilio Hymen*: wings three-tailed, brown, spotted with white beneath; upper pair white above. It inhabits Africa; and is to be seen in Sir Joseph Banks's museum.

259. *Papilio Pindarus*: wings nearly three-tailed, blue with a black border; beneath brown, with silvery and fulvous spots. Inhabits India.

260. *Papilio Pelion*: wings nearly three-tailed, blue with gold dots and a brown border. It inhabits America.

261. *Papilio Vulcanus*: wings two-tailed, above brown, with fulvous spots; beneath variegated with fulvous, yellow, and silvery streaks. It is a native of India.

262. *Papilio Ganymedes*: wings two-tailed, bluish, with a brown border; beneath greenish, at the base with gold dots. It inhabits India.

263. *Papilio Mars*: wings two-tailed, brown; lower ones with a rufous spot and two white dots, and an oblique band beneath. A native of America.

264. *Papilio Iocastes*: wings two-tailed, brown, two approximate waved darker streaks, and a double black spot at the angle of the tail. This and the two following are found in India.

265. *Papilio Atys*: wings two-tailed, brown with a blue disk; beneath cinereous with brown veins, the base with a fulvous spot, and white dots.

266. *Papilio Sophocles*: wings two-tailed, black, with a common blue disk; beneath white, with waved yellowish streaks, the lower ones with a fulvous dot at the tip.

267. *Papilio Euripides*: wings two-tailed, with a blue disk; beneath brown, with an abbreviated white streak on the upper pair, and two angular rufous streaks and marginal ocellar spots on the lower ones.

268. *Papilio Anacreon*: wings two-tailed, brown; beneath waved with white, and a macular fulvous streak behind. This and the next species are natives of India.

269. *Papilio Thales*: wings two-tailed, black, with blue lunules beneath, lower ones beneath with an abbreviated sub-marginal gold band.

270. *Papilio Endymion*: wings two-tailed; beneath green, with rufous and gold specks; lower ones with a black streak and red band.

271. *Papilio Venus*: wings two-tailed; lower surface of the upper pair green, speckled with gold; of the lower ones gold, spotted with green and black. There is a variety of this species, of which the wings are three-tailed, bluish, tipped with black; beneath golden, speckled with black.

272. *Papilio Sphinx*: wings two-tailed, bluish; beneath cinereous, with a double black spot at the angle of the tail. This and the next are natives of India.

273. *Papilio Melibœus*: wings two-tailed, bluish, with a brown border; beneath yellowish, with brown streaks on the upper pair, and black ones on the lower; angle of the tail black, with blue rings.

274. *Papilio Mæcenæ*: wings two-tailed, black, with a blue disk beneath, with chestnut-brown clouds. It inhabits China.

275. *Papilio Tyrtæus*: wings two-tailed, brown; lower ones beneath with a waved white streak, and black marginal lunules, the middle ones rufous. This and the next are natives of India.

276. *Papilio Xenophon*: wings two-tailed, brown, with a yellow disk; beneath cinereous, with a white streak in the middle, joined to a brown one.

277. *Papilio Marfyas*. A very beautiful exotic species, a native of India, and of a most exquisite lucid blue colour, edged with black, and farther ornamented by having each of the lower wings tipped with two narrow black tail-shaped processes. This is represented at fig. 32.

278. *Papilio Phorbas*: wings tailed, brown, with a white disk; beneath white, with cinereous streaks, and two black dots at the angle of the tail. It inhabits India.

279. *Papilio betulæ*: wings slightly tailed, brown; beneath yellowish, with two white streaks on the lower ones. See fig. 33.

280. *Papilio pruni*: wings slightly tailed; above brown, with a red spot at the tip of the lower ones; lower wings beneath, with a fulvous marginal band dotted with black. This and the last species are found in this country.

281. *Papilio spini*: wings tailed, brown; beneath cinereous, with fulvous marginal lunules, and a bluish spot near the tail. It is found in Germany, on the *Prunus spinosa*, hence its specific name.

282. *Papilio quercus*: wings slightly tailed, bluish, edged white; beneath cinereous. A native of England, and other parts of Europe. Fig. 34.

283. *Papilio cerasi*: wings tailed, brown, immaculate; beneath a white streak, and fulvous lunules marked with a black dot on the lower ones. Inhabits Austria.

284. *Papilio acaciæ*: wings tailed, brown; beneath bluish; with a white streak, and fulvous lunules near the tail. This is a Russian insect.

285. *Papilio fedi*: wings tailed, blue, the margin spotted with white; beneath white, with square black spots and a rufous band. Inhabits Germany.

286. *Papilio rubi*: wings slightly tailed; above brown; beneath

beneath green. This is found in our own country, and other parts of Europe.

β. Plebeii urticae; of or near towns.

287. *Papilio exclamatoris*: wings entire, divaricate, brown; upper pair with a yellowish line, and dots under it. Inhabits India.

288. *Papilio comma*: wings entire, divaricate, fulvous with a black line on the upper pair; beneath spotted with white. This is found in England.

289. *Papilio linea*: wings entire, divaricate, fulvous, edged with black. It inhabits Austria.

290. *Papilio colon*: wings divaricate, fulvous, with a brown striate margin and spot in the middle. It inhabits India.

291. *Papilio bixæ*: wings rounded, brown, greenish at the base; lower ones beneath with a yellow band. It inhabits America.

292. *Papilio melvæ*: wings indented, divaricate, brown, with cinereous waves; upper pair with hyaline dots; lower ones with white dots beneath. Inhabits this country. Fig. 35.

293. *Papilio fritillum*: wings entire, divaricate, black, dotted with white. It inhabits Europe.

294. *Papilio vibrius*: wings entire, black; upper pair with three white dots; lower ones tipped with white. Inhabits Surinam.

295. *Papilio pygmaeus*: wings entire, brown, immaculate.

The method of preserving butterflies, for forming a cabinet, has been shown under the article ENTOMOLOGY, vol. vi. p. 844. but, where the very large species are the objects of attention, it will not be amiss to advert to the directions given under NATURAL HISTORY, vol. xvi. p. 602. We shall conclude this article with extracting, from Edwards's Hist. of Birds, vol. ii. a method of taking impressions from butterflies, so as to form a picture.

"Take butterflies, or field-moths, either those caught abroad, or such as are taken in caterpillars and nursed in the house till they be flies; clip off their wings very close to their bodies, and lay them on clean paper, in the form of a butterfly when flying; then have ready prepared gum arabic that hath been some time dissolved in water, and is pretty thick; if you put a drop of ox-gall into a spoonful of this, it will be better for the use; temper them well with your finger, and spread a little of it on a piece of thin white paper, big enough to take both sides of your fly. When it begins to be clammy under your finger, the paper is in proper order to take the feathers from the wings of the fly. Then lay the gummed side on the wings, and it will take them up. Then double your paper so as to have all the wings between the paper. Then lay it on a table, pressing it close with your fingers; and you may rub it gently with some smooth hard thing. Then open the paper and take out the wings, which will come forth transparent: the down of the upper and under side of the wings sticking to the gummed paper, form a just likeness of both sides of the wings in their natural shapes and colours. The nicety of taking off flies depends on a just degree of moisture of the gummed paper: for, if it be too wet, all will be blotted and confused; and, if too dry, your paper will stick so fast together, that it will be torn in separation. When you have opened your gummed papers, and they are dry, you must draw the bodies from the natural ones, and paint them in water-colours: you must take paper that will bear ink very well for this use; for sinking-paper will separate with the rest, and spoil all."

PAPILIONACEOUS, *adj.* [from *papilio*, Lat.]—The flowers of some plants are called *papilionaceous* by botanists, which represent something of the figure of a butterfly, with its wings displayed; and here the petala, or flower-leaves, are always of a difform figure: they are four in number, but joined together at the extremities; one of these is usually larger than the rest, and is erected

in the middle of the flower, and by some called *vexillum* : the plants that have this flower are of the leguminous kind; as pease, vetches, &c. *Quincy*.—All leguminous plants are, as the learned say, *papilionaceous*, or bear butterflyed flowers. *Harte*.

PAPIL'LA, *f.* [Latin.] The nipple.

PAPIL'LAE, *f. plu.* The nipples of the breasts; the dugs of beasts; little protuberances on the tongue; glandules on several parts of the body, so called on account of their resemblance to a pap or nipple.

PAPILLARY, or **PAPIL'LOUS**, *adj.* Having emulgent vessels, or resemblances of paps.—Malpighi concludes, because the outward cover of the tongue is perforated, under which lie *papillary* parts, that in these the taste lieth. *Derham's Phys. Theol.*—The *papillous* inward coat of the intestines is extremely sensible. *Arbutnot on Aliments*.—In botany; somewhat like a nipple; to be distinguished from *verrucosus*, or warty.

PAPILLON' (Philibert), a man of letters, was the son of an eminent advocate at Dijon, where he was born in 1666. He studied first in the Jesuits' college at Dijon, and afterwards at Paris, where he was admitted a bachelor of civil and canon law. Returning to his native province, he embraced the ecclesiastical state, and received priest's orders in 1694. He had previously obtained a canonry of a moderate revenue, but sufficient for all his wants, since his sole ambition was to possess a good library, and to be able to devote himself to the cultivation of literature. The great object of his researches was literary history, especially that of his own province; and, as he was obligingly communicative of his stores, the works of several other writers were enriched by his collections. The principal work of his own, was his "*Bibliothèque des Auteurs de Bourgogne*," which appeared after his death in two volumes folio, 1742 and 1745. This estimable man, whose modest, frank, and amiable disposition, endeared him to all his acquaintance, died at Dijon in 1738.

PAPIMOUAGOU', a lake of Canada: seventy miles north-north-east of Quebec. Lat. 50. N. lon. 69. 20. W.

PAPIN (Denys), an ingenious physician, the son of Nicholas Papin, also a physician, was born at Blois. He took the degree of M.D. and travelled to England, where he was elected a fellow of the Royal Society in December 1680. He passed the following year in London, and published an account of a machine which he had invented and which still bears his name; this was "*The New Digester, or Engine for the softening of bones*;" 4to. 1681. It soon appeared in French, with the title of *La Manière d'Amollir les Os, et de faire cuire toutes sortes de Viandes en peu de tems et à peu de frais*; Paris, 1682. The machine consists of a very strong metal boiler, with an airtight cover screwed down with great force; hence the contained fluid, being incapable of escaping either by evaporation or by bursting the machine, may be heated to a degree far beyond that of boiling water, so as to dissolve the gluten of bones and cartilages. He afterwards improved this digester, and it has since been much employed in chemical and philosophical experiments. He assisted Boyle in various experiments, of which an account is given in the History of the Royal Society. Papin was a Calvinist, and was therefore prevented from returning home by the revocation of the edict of Nantes. He afterwards resided at Marburg, where he taught the mathematics, and published a "*Fasciculus Dissertationum de quibusdam Machinis Physicis*," 12mo. 1696; and, in 1707, he published at Frankfurt, an account of a machine which he had invented for raising water by the action of fire, entitled "*Ars nova ad aquam ignis adminiculo efficacissimè elevandam*."

His father, Nicholas Papin, mentioned above, was author of several works, which, however, are nearly forgotten. Two of them related to the powder of sympathy, which he defended; and one to the discovery of Harvey, which he opposed.

PAPIN,

PAPIN (Isaac), a celebrated French divine, who renounced the protestant faith, and embraced that of Rome, was descended from a respectable family, and born at Blois in 1657. Being intended for the ministry, he was sent to study philosophy and divinity at Geneva; whence he removed to Orleans, in 1679, to perfect himself in the Greek and Hebrew languages under the instructions of the famous Claude Pajon, who was his maternal uncle. In the life of that gentleman we have seen, that he differed in opinion from the majority of his protestant brethren on some disputed points; (see p. 259.) Isaac Papin adopted his uncle's sentiments, and avowed them every where, without ambiguity or reserve. On this account, and because he refused to sign the condemnation of them, when required to do so by the academy of Saumur in 1683, he was not permitted to receive the usual testimonials to his character and qualifications. This treatment created disgust in his mind against the leading men in the protestant party, and, by a natural process, disposed him to view the religious principles of their opponents in a more favourable light than he had done before. In this temper he composed, and published at Bourdeaux, a treatise, entitled "The Faith kept within due Bounds, and reduced to its true Principles;" in which he maintained, that, since the papists professed to embrace the doctrine of the holy scriptures, they were entitled to toleration from the most zealous protestants. He also wrote several letters to the members of the reformed communion at Bourdeaux, in order to satisfy them that they might be saved in the Roman-catholic church, should they become reconciled to it. These publications, as might be expected, exasperated the more zealous protestants against him; and, to avoid the effects of their resentment, he crossed the sea to England, where he was admitted to priest's orders in the year 1686. About the same time he published a work against M. Jurieu, entitled, "Theological Essays concerning Providence and Grace, in which an Attempt is made to disentangle M. Jurieu from all the perplexing Difficulties which present themselves under his System;" in two volumes. This work provoked the malignant resentment of Jurieu, who, understanding that Papin was endeavouring to obtain employment as a professor in Germany, wrote letters every where, to prevent the success of his applications; and, though he obtained the situation of a preacher at Hamburg for a few months, Jurieu found means to procure his dismissal from it. About the same time Mr. Bayle, having met with our author's treatise, entitled *The Faith kept within due Bounds, &c.* reprinted it, with the addition of some pages of new matter. These were attributed by Jurieu to M. Papin, who did not disavow the principal maxims laid down in them, which were condemned by the synod of Bois-le-duc in 1687. During the following year, these principles, and the other distinguishing tenets of our author, were condemned with still greater marks of severity by the French synod at the Hague, where a sentence of excommunication was pronounced against M. Papin. In the mean time he accepted an invitation to fill a professor's chair in the church of the French refugees at Dantzic. He had not been long in this post, before it was proposed to him that he should subscribe and conform to the synodal decisions of the Walloon churches in the United Provinces; but to this he would not consent, because they enforced the belief of sentiments contradictory to his own, particularly the opinion that Jesus Christ died only for the sake of the elect. This refusal gave great offence to the persons who had invited him to Dantzic; and, in six months time after his arrival there, the connexion between them was dissolved. Exasperated at the repeated obstacles which he met with to obtain an honourable settlement among the protestants, and the persecutions with which he was harassed by Jurieu and some of his brother-bigots, M. Papin returned to France, and embraced the Roman-catholic religion, delivering his abjuration into the hands

of Bossuet bishop of Meaux, in the year 1690. Upon this change, Jurieu wrote a pastoral letter to the French protestants, in which he pretended, that M. Papin had ever regarded all religions with equal indifference, and that it was in this spirit that he had become reconciled to the church of Rome. By way of reply to this letter, our author composed a treatise "Concerning the Toleration of Protestants, and the Authority of the Church," which met with the approbation of Bossuet, and was published in 1692. Afterwards M. Papin changed the title of the work, which was rather equivocal, and made some additions to it; but, while he was engaged in forming collections to render it more complete, and in finishing other pieces of the same kind, he died at Paris in 1709, at the age of fifty-two. After his death, his theological pieces, which are chiefly controversial, and all written with ability and shrewdness, were collected together, and published in Holland, in 1713, 12mo. and a third edition of them was printed at Paris, in 1723, in 3 vols. 12mo. with the life of the author prefixed, written by his widow. *Gen. Biog.*

PAPIN'ACHOIS, a river of Canada, which runs into the Saguenay in lat. 48. 24. N. lon. 70. 50. W.

PAPIN'ACHOIS, Indians of Canada, so named from the river. They inhabit from lat. 50. to 51. N. lon. 69. to 71. W.

PAPINIANUS, a celebrated Roman lawyer, was the disciple of Cerebrius Scaevola, under whom Septimius Severus, afterwards emperor, was also brought up. Papinianus succeeded Severus in his office of advocate to the treasury; and was created pretorian prefect by Severus after he had ascended the imperial throne in 194. His profound knowledge of the law, and his incorruptible integrity, gave him great influence during this reign, the rigours of which he softened by his counsels as much as lay in his power. It is affirmed, but apparently upon little authority, that he was related to the empress, Julia Domna. Severus, on his death-bed, particularly recommended his sons Caracalla and Geta to the care of this faithful servant; and he accordingly used all his efforts to preserve that fraternal union between them which soon appeared in danger of dissolution. His remonstrances were so disagreeable to Caracalla, that he was deprived of the post of pretorian prefect; yet the weight of his character induced that emperor to keep him about his person, and treat him as if still in his confidence. When Caracalla had perpetrated the execrable murder of his brother, he strongly urged Papinianus to compose a justification of the action; but received from him the severe reply, "That it was easier to commit a parricide than to defend it; and that it was a second parricide to vilify the memory of the innocent." The monster dissembled the resentment he felt; but when, soon after, the pretorian guards, probably through his instigation, demanded the head of Papinianus, he readily gave him up to their rage, and he suffered under the axe, A. D. 212. This eminent lawyer composed a great number of works, and formed several illustrious disciples. His juridical authority rose beyond that of any of his predecessors; and remained in such consideration, that the emperor Valentinian III. made a decree, that, in cases in which the opinions of judges should be divided, the preponderance should be given to that which should have the support of Papinianus.

PAPI'RA, or PAPYRA, in ancient geography, a town of Asia, in Galatia, upon the route from Paphlagonia to Ancyra, between Vindia and Ancyra; according to the Itinerary of Antonine.

PAPIRE-MASSON. See MASSON (John Papirius), vol. xiv.

PAPIR'IA, *f.* in botany. See GETHYLLIS.

PAPIR'IUS CUR'SOR, the name of two Roman generals and consuls, who distinguished themselves more particularly against the Samnites. See the article ROME.

PA'PISM, *f.* [from *pape*, Fr.] Popery.—The place is long, which deserves to be read for the objection of the universality

universality of Arianism, like to that of *papism* in these last ages. *Bp. Bedell.*

PAPIST, *f.* [*papiste*, Fr. *papista*, Lat.] One that adheres to the communion of the pope and church of Rome.—The principal clergyman had frequent conferences with the prince, to persuade him to change his religion, and become a *papist*. *Clarendon.*

The word *Papist* seems to be considered by the Roman-catholics themselves as a nick-name of reproach, originating in their maintaining the supreme ecclesiastical (and heretofore temporal) power of the pope, *papa*.

This word, *Papist*, came into use soon after the Reformation. From that time, the word *Protestant* was used to denote all descriptions of Christians who were not in communion with the church of Rome; and the word "*Papist*" was used to denote that description of Christians which remained in communion with her. It is to be observed, that, before the laws passed in the late reign, to repeal the principal penal laws in force against the Roman-catholics, the word "*Papist*" had a very extensive signification. In the language of the law, *Papists* are divided into five classes. *The mere Papist* was a person who had done those acts which amounted to legal evidence of *Papistry*; *the reputed Papist* was a person generally considered to have done such acts; *the Popish recusant* was a *Papist* who absented himself from the Protestant church; *the Popish recusant convict* was a *Papist* legally convicted of such absence. Several statutes inflicted the penalties, legally incident to *Popish recusancy*, on the commission of certain acts, and the omission of others, into which the religious principles of Roman-catholics frequently led them; and thus constituted an *indirect recusancy*, the fifth and last species of *Papistry*, if it can be justly called by that name. But "*Papist*" was the general appellation given to the particular denomination of Christians who are the subject of the present article. It was always considered by them to be a term of reproach, and they affected the appellation of Roman-catholics. In the oath, which passed in the year 1791 for the relief of the Roman-catholics, the person who takes it is made to say, "I, A. B. do hereby declare, that I do profess the Roman-catholic religion." Since the passing of that act, the name of Roman-catholic has been generally given them; and it now seems to be their proper legal appellation.

The history of the English Catholics, as a distinct body of Dissenters, begins with the reign of Elizabeth. In the course of her reign, many oppressive, and even sanguinary, laws were enacted against them. The justice and policy of those laws scarcely find at this time a single advocate. But when they were enacted they found their defenders; and, among them, none more able than lord-treasurer Burleigh, who published, or rather caused to be published, in their defence, a book entitled "The Execution of Justice;" in which he attempted to show, that the Catholic priests, executed in the reign of queen Elizabeth, were not executed for their religion, but for treasonable practices. In answer to it, cardinal Allen published his modest "Defence of the English Catholics." The subject was revived in our times by Dr. Sturges's "Reflections on Popery." To those, Dr. Milner opposed his "Letters to a Prebendary;" one of the most successful works that has appeared in defence of the Roman-catholics. A discussion of this controversy would be misplaced in a work like the present. We shall only mention that, by a succession of legislative enactments during the reigns of queen Elizabeth, of the three first Stuart monarchs, and of the three monarchs who filled the throne from the abdication of king James II. to the accession of king George II. the Catholics were subjected to the heaviest pains, penalties, and disabilities. The laws by which they were inflicted may be reduced under four heads.

1. The first are those which subjected them to penalties and punishments for exercising their religious worship; under which head may be ranked the laws respecting their

education, and the ministers of their church. By these laws, if an English priest of the church of Rome, born in the dominions of the crown of England, came to England from beyond the seas, or tarried in England three days without conforming to the church, he was guilty of high treason; and those incurred the guilt of high-treason, who were reconciled to the see of Rome, or procured others to be reconciled to it. By these laws also, *Papists* were totally disabled from giving their children any education in their own religion: for, if they educated their children at home, then, for maintaining the school-master, if he did not repair to church, or was not allowed by the bishop of the diocese, they were liable to forfeit 10l. a-month, and the school-master was liable to forfeit 40s. a-day; and, if they sent their children for education to any school of their persuasion abroad, they were liable to forfeit 100l. and the children, so sent, were disabled from inheriting, purchasing, or enjoying, any lands, profits, goods, debts, duties, legacies, or sums of money. Saying mafs was punishable by a forfeiture of 200 marks; hearing it by a forfeiture of 100. See 1 Eliz. c. 2. 23 Eliz. c. 1. 27 Eliz. c. 2. 29 Eliz. c. 6. 35 Eliz. c. 2. 2 Jac. I. c. 4. 3 Jac. I. c. 4. 5. 7 Jac. I. c. 6. 3 Car. I. c. 2. 25 Car. II. c. 2. 7 & 8 W. III. c. 27. 1 Geo. I. c. 13.

2. Under the second head, were those laws which punished the English communicants with the church of Rome, for not conforming to the established church. These are generally called the Statutes of Recusancy. It should be observed, that absence from church alone, and unaccompanied by any other act, constituted recusancy, in the true sense of that word. Till the statute of 35 Eliz. c. 2, all nonconformists were considered as recusants, and were all equally subject to the penalties of recusancy. That statute was the first penal statute made against *Popish Recusants* by that name, and as distinguishing from other Recusants. From that statute arose the distinction between Protestant and *Popish Recusants*; the former were subject to such statutes of recusancy as preceded that of the 35th of queen Elizabeth, and to some statutes against recusancy made subsequently to that time; but they were relieved from them all by the Act of Toleration in the first year of king William's reign. From 35 Eliz. c. 2, arose also the distinction between *Papists*, and persons professing the popish religion, and *Popish Recusants*, and *Popish Recusants convict*.

By the statutes against *popish recusants convict*, they were punishable by the censures of the church, and by a fine of 20l. for every month during which they absented themselves from church; they were disabled from keeping arms in their houses; from maintaining actions, or suits at law or in equity; from being executors or guardians; from presenting to advowsons; from practising in the law or physic; and from holding offices, civil or military; they were subject to the penalties attending excommunication; were not permitted to travel five miles from home, unless by licence, upon pain of forfeiting all their goods; and might not come to court, under pain of 100l. A married woman, when convicted of recusancy, was liable to forfeit two-thirds of her dower or jointure: she could not be executrix or administratrix to her husband, or have any part of his goods; and during her marriage she might be kept in prison, unless her husband redeemed her at the rate of 10l. a-month, or the third part of his lands. *Popish recusants convict* were, within three months after conviction, either to submit and renounce their religious opinions, or, if required by four justices, to abjure the realm; and, if they did not depart, or if they returned without a licence, they were guilty of felony, and were to suffer death as felons. See the statutes referred to under the former head.

3. As to the penalties or disabilities attending the refusal of Roman-catholics to take the Oath of Supremacy, the Declaration against Transubstantiation, and the Declaration against Popery; it must be premised, that the Roman-catholics make no objection to take the Oath of Allegiance,

Allegiance, (1 Geo. II. c. 13.) or the Oath of Abjuration, (6 Geo. III. c. 53.) With respect to the Oath of Supremacy, by 1 Eliz. c. 1, the persons therein mentioned were made compellable to take the oath of supremacy contained in that act. By the third of James I. c. 4, another oath was prescribed to be taken, commonly called the "Oath of Allegiance and Obedience." These oaths were abrogated by the first of William and Mary c. 8. and a new oath of allegiance, and a new oath of supremacy, were introduced, and required to be taken in their stead. The statute made in the second session of the first year of Geo. I. c. 13. contains an oath of supremacy, in the same words as the oath of supremacy required to be taken by the first of king William and queen Mary. By that oath persons are made to swear, "That no foreign prince, person, prelate, state, or potentate, hath, or ought to have, any jurisdiction, power, supremacy, pre-eminence, or authority, ecclesiastical or spiritual, within the realm." It was required to be taken by the persons therein named; it might be tendered to any person, by any two justices of the peace; and persons refusing the oath so tendered, were adjudged to be popish recusants convict, and to forfeit and be proceeded against as such. This was the *constructive recusancy* referred to above. It was not the offence itself of recusancy, which, as we have already observed, consisted merely in the party's absenting himself from church; it was the offence of not taking the oath of supremacy, and the other oaths prescribed by the act of 1 Geo. I. the refusal of which was, by that statute, placed on the same footing as a legal conviction on the statutes of recusancy, and subjected the party refusing to the penalties of those statutes. This was the most severe of all the laws against Papists; as it restrained them from practising the law as advocates, barristers, solicitors, attorneys, notaries, or proctors, and from voting at elections.

With respect to receiving the sacrament of our Lord's supper; by 13 Car. II. (commonly called the Corporation Act,) no person can be legally elected to any office relating to the government of any city or corporation, unless, within a twelvemonth before, he has received the sacrament of the Lord's supper according to the rites of the church of England; and he is also enjoined to take the oaths of allegiance and supremacy, at the same time that he takes the oath of office; or, in default of either of these requisites, such election shall be void.

As to the Declaration against Transubstantiation, by 25 Car. II. c. 2. (commonly called the Test Act,) all officers, civil or military, are directed to take the oath, and make the declarations against transubstantiation, in the court of King's Bench or Chancery, the next term, or at the next quarter-sessions, or (by subsequent statutes) within six months after their admission; and also, within the same time, to receive the sacrament of the Lord's supper, according to the usage of the church of England, in some public church immediately after divine service and sermon; and to deliver into court a certificate thereof, signed by the minister and churchwardens, and also to prove the same by two credible witnesses, upon forfeiture of 500l. and disability to hold the office.

With respect to the Declaration against Popery; the act passed in the 30th year of Car. II. stat. 2. c. 1. contains the declaration, and prescribes it to be made by members of either house of parliament, before they take their seats; by it they declare their disbelief of the doctrine of transubstantiation; and their belief that the invocation of saints and the sacrifice of the mass are idolatrous.

4. With respect to the laws affecting their landed property; how this was affected by the laws against recusancy has been already mentioned. By the 11 & 12 W. III. c. 4. it was enacted, that a person educated in the popish religion, or professing the same, who did not, in six months after the age of sixteen, take the oaths of allegiance and supremacy, and subscribe the declaration of 30 Car. II. should, in respect of himself only, and not of

his heirs, or posterity, be disabled to inherit or take lands by descent, devise, or limitation, in possession, reversion, or remainder; and that during his life, till he took the oaths, and subscribed the declaration against popery, his next of kin, who was a protestant, should enjoy the lands without accounting for the profits, and should be incapable of purchasing; and that all estates, terms, interests, or profits, out of lands, made, done, or suffered, to his use, or in trust for him, should be void. By 3 Jac. I. c. 5. 1 W. & M. c. 26. 12 Anne, stat. 2. c. 14. 11 Geo. II. c. 17. Papists, or persons professing the popish religion, were disabled from presenting to advowsons, and other ecclesiastical benefices, and to hospitals and other charitable establishments. By annual acts of legislature, Papists, being of the age of eighteen years, and not having taken the oaths of allegiance and supremacy, were subjected to the burthen of the double land-tax. By a statute made in the second session of the first year of Geo. I. c. 55, they were required to register their names and estates in the manner and under the penalties therein mentioned; and by 3 Geo. I. c. 18. continued by several subsequent statutes, an obligation of enrolling their deeds and wills was imposed on them. Such were the principal penal laws against Roman-catholics at the time of the accession of the house of Brunswick.

To the enlightened and humane temper of the times during the reign of his late majesty, his Roman-catholic subjects are wholly indebted for any appeal of this large and grievous code. Two acts in particular have been already passed for their relief.

1. The first of those acts was passed in the 18th year of his late majesty's reign. It enacted, that so much of the 11 & 12 W. III. as related to the prosecution of popish priests and Jesuits, and imprisoning for life Papists who keep schools, or to disable Papists from taking by descent or purchase, should be repealed as to all Papists, or persons professing the popish religion, who, within six months after the passing of the act, or their coming of age, should take the oath prescribed by the act. This is an oath expressive of allegiance to his majesty, abjuration of the pretender, renunciation of the pope's civil power, and abhorrence of the doctrines of destroying, and not keeping faith with, heretics; and of deposing or murdering princes excommunicated by authority of the see of Rome.

This act was an essential benefit to Roman-catholics; but its best effect in their regard, was its operation on the public mind, by lessening the prejudice generally entertained against them, and bringing them and their fellow-subjects into habits of social intercourse and amity, which the penal code had too much interrupted. It can only be conceived by those who witnessed it, what a sudden and extensive effect, in this regard, was produced by this single act of parliament.

2. A more extensive relief from the penal laws was granted to the English Roman-catholics by an act of the 31st year of the reign of his late majesty. The stat. 31 Geo. III. c. 32. may be divided into six parts. The 1st contains the declaration and oath afterwards referred to in the body of the act, and prescribes the method of taking it. The second is a repeal of the statutes of recusancy, in favour of persons taking the oath thereby prescribed. The 3d is a toleration, under certain regulations, of the religious worship of the Roman-catholics, qualifying in like manner, and of their schools for education. The 4th enacts, that in future no one shall be summoned to take the oath of supremacy prescribed by stats. 1 W. & M. c. 8. 1 Geo. I. stat. 2. c. 13. [but electors of members of parliament in England, still remain bound to take this oath;] or the declaration against transubstantiation; that the stat. 1 W. & M. c. 9. for removing Papists, or reputed Papists, from the cities of London and Westminster, shall not extend to Roman-catholics taking the appointed oath; and that no peer of Great Britain or Ireland, taking that oath, shall be liable to be prosecuted for coming into his majesty's presence, or into the court

or house where his majesty resides, under stat. 30 Car. II. ft. 2. c. 1. The 5th part of the act repeals the laws requiring the deeds and wills of Roman-catholics to be registered or enrolled. The 6th excuses persons acting as counsellors at law, barristers, attornies, clerks, or notaries, from taking the oath of supremacy, or the declaration against transubstantiation.

To state this statute something more particularly: Roman-catholics, who are willing to comply with the requisitions contained in it, must appear at some of the courts at Westminster, or at the quarter-sessions held for the county, city, or place, where they shall reside, and shall make and subscribe a declaration, that they profess the Roman-catholic religion; and also an oath, which is nearly similar to that required by stat. 18 Geo. III. c. 60. the substance of which is stated above. The chief difference in the oath is, that the words of that in stat. 31 Geo. III. c. 32. are stronger, and more adapted to present times and circumstances; and probably intended to be less liable to equivocation or evasion. On this declaration and oath being duly made by any Roman-catholic, the officer of the court shall grant him a certificate; and such officer shall yearly transmit to the privy-council, lists of all persons who have thus qualified themselves within the year in his respective court. The statute then provides, that a Roman-catholic thus qualified shall not be prosecuted under any statute for not repairing to a parish-church, nor shall he be prosecuted for being a Papist, nor for attending or performing mass or other ceremonies of the church of Rome; provided that no place shall be allowed for an assembly to celebrate such worship until it is certified to the sessions; nor shall any minister officiate in it until his name and description are recorded there. And no such place of assembly shall have its doors locked or barred during the time of meeting or divine worship.

And if any Roman-catholic whatever is elected constable, churchwarden, overseer, or into any parochial office, he may execute the same by a deputy, to be approved, as if he were to act for himself as principal. But every minister who has qualified shall be exempt from serving upon juries, and from being elected into any parochial office. And all the laws for frequenting divine service on Sundays shall continue in force; except where persons attend some place of worship allowed by this statute, or the Toleration Act of the *Dissenters*; stat. 1 W. & M. c. 8.

If any person disturb a congregation allowed under this act, he shall, as for disturbing a Dissenting meeting, be bound over to the next sessions, and, upon conviction there, shall forfeit 20l.

No Roman-catholic minister, however, shall officiate in any place of worship having a steeple and a bell, or at any funeral in a church or church-yard, or shall wear the habits of his order, except in a place allowed by this statute, or in a private house where there shall not be more than five persons besides the family. This statute shall not exempt Roman-catholics from the payment of tithes, or other dues, to the church; nor shall it affect the statutes concerning marriages, or any law respecting the succession to the crown. No person who has qualified shall be prosecuted for instructing youth, except in an endowed school, or a school in one of the English universities; and except also, that no Roman-catholic school-master shall receive into his school the child of any Protestant father; nor shall any Roman-catholic keep a school until his or her name be recorded as a teacher at the sessions.

No religious order is to be established; and every endowment of a school or college by a Roman-catholic shall still be superstitious and unlawful.

The declaration prescribed by the act is contained in these words: "I, A. B. do hereby declare, that I do profess the Roman-catholic religion." Till the passing of this act, the persons who were the subject of it

were known in the English law by the name of Papists, reputed Papists, or persons professing the popish religion. As the bill was originally framed, and as it stood, when, having passed the commons, it was brought into the house of lords, the first clause in it directed, that the oath contained in the stat. 18 Geo. III. c. 60, should be taken no longer; but that the oath appointed by the bill should, in future, be administered in its stead, and should give the same benefits and advantages, and should operate to the same effects and purposes, as the oath contained in the stat. 18 Geo. III. c. 60. This clause was altered, in the house of lords, to the form in which it stands in the act. It does not express that the oath contained in it shall entitle the persons taking it to the benefits of the stat. 18 Geo. III. it only expresses that it shall be lawful for Catholics to take the oath prescribed at the places and times, and in manner, therein mentioned. Thus it was uncertain whether persons taking only the oath prescribed by the stat. 31 Geo. III. would be entitled to the benefit of the stat. 18 Geo. III. so as to be relieved from the penalties and disabilities from which the persons taking the oath prescribed by that act, were released by it. The chief of these penalties and disabilities were those which disabled them from taking by descent or purchase: and it was thought advisable for every Roman-catholic, who wished to be secure in the enjoyment of his landed property, to take both the declaration and oath prescribed by the stat. 31 Geo. III. and the oath prescribed by the former stat. 18 Geo. III. But all doubt on this subject is now removed by stat. 43 Geo. III. c. 30. which, after reciting the inconvenience above stated, enacts, "That the declaration and oath contained in the act 31 Geo. III. shall, as to all persons who have made, taken, and subscribed, the same, or who at any time hereafter shall make, take, or subscribe, the same, give the same benefits and advantages, and be and operate to and for the same intents and purposes, as in and by the said act of 18 Geo. III. is enacted, expressed, and declared, of and concerning the oath thereby subscribed."

The statute 1 W. & M. c. 18, (commonly called the Toleration Act,) exempts all Dissenters, except Papists and such as deny the Trinity, from all penal laws relating to religion; provided they take the Oaths of Allegiance and Supremacy, and subscribe the Declaration against Popery, and repair to some congregation registered in the bishop's court, or at the sessions. But there is nothing in this act which dispenses either with the Test-Act or the Corporation-Act, so far as they impose the obligation of receiving the sacrament of our Lord's Supper on persons serving in offices or elected to serve in corporations; and there is nothing in the statute 31 Geo. III. c. 32. which dispenses Catholics from that obligation, in case of their serving in offices, or being admitted into corporations. With respect, therefore, to the Test-Act and Corporation-Act, these are the only statutes which subject the Protestant Dissenters to any penalties or disabilities; to these the Roman-catholics are subject equally with the Protestant Dissenters: there is, therefore, no penalty or disability that affects the Protestant Dissenters, to which Roman-catholics are not subject equally; but there still remain several penalties and disabilities to which Roman-catholics are subject, that do not in any respect whatever affect the Protestant Dissenters.

The principal of these are, that by stat. 30 Car. II. ft. 2. c. 1, Roman-catholics, in consequence of refusing the Oath of Supremacy, or the Declaration against Popery, are disabled from sitting in either house of parliament. By stats. 7 & 8 W. III. c. 27, those who refuse to take the Oath of Supremacy are disabled from voting at elections (in Great Britain;) and by several statutes, Roman-catholics are disabled from presenting to advowsons. This latter is peculiar to them; Quakers, and even Jews, having the full enjoyment of the right of presentation.

By the Militia Acts, previous to 42 Geo. III. c. 90, 91. the oath required to be taken by persons enrolled in the militia

militia of Great Britain, was as follows: "I, A. B. do sincerely promise and swear, that I will be faithful, and bear true allegiance, to his majesty king George, his heirs and successors. And I do swear, *that I am a Protestant*, and that I will faithfully serve in the militia, within the kingdom of Great Britain, for the defence of the same, during the time for which I am enrolled, unless I shall be sooner discharged." In the acts of 42 Geo. III. the words declaring the person to be a Protestant are omitted.

By stat. 31 Geo. III. c. 32. Roman-catholics stand, as to the serving upon *juries*, in the same predicament as the rest of his majesty's subjects. Ministers of Roman-catholic congregations are exempted from serving on juries, by § 8 of the statute.

The first step taken in the late reign to give relief to the Papists in Ireland, was by the acts 1 Geo. III. c. 12 & 13. 3 Geo. III. c. 26. and 13 & 14 Geo. III. c. 25. by which the possessions of Protestants were protected, who derived title from or through Papists.

The next step was by enabling Papists to take leases for 61 years, of not more than fifty acres of unprofitable bog, for the purpose of reclaiming the same. 11 & 12 Geo. III. c. 21.

By 13 & 14 Geo. III. c. 35. an oath of allegiance and a declaration was framed for the Papists, and which they were allowed to take, "in order to give them an opportunity of testifying their allegiance, and to promote peace and industry among the inhabitants." By 17 & 18 Geo. III. c. 49. Papists taking and subscribing this oath and declaration, were empowered to take leases for 999 years at a bona-fide money-rent reserved; and to dispose of the same by will or otherwise. And all lands and tenements whereof any Papist was or should be seized, were declared to be defendible, devisable, and transferrable, as fully as if the same were in the seizer of any other subjects.

By 21 & 22 Geo. III. c. 24. Papists taking oath, &c. required by 13 & 14 Geo. III. are empowered to purchase or take by grant, limitation, descent, or devise, any lands, tenements, or hereditaments, in Ireland, or any interest therein, (except advowsons, and except any manor or borough returning members of parliament,) and to dispose of the same by will or otherwise; and such lands, &c. so purchased or taken, shall be defendible according to the course of the common law; and devisable, and transferrable in like manner as the lands of Protestants. Various minor disabilities are also removed by this act, and 21 & 22 Geo. III. c. 61. and 30 Geo. III. c. 29.

By 32 Geo. III. c. 21. Papists (taking the oath required by 13 & 14 Geo. III. c. 35.) are enabled to be barristers, attorneys, solicitors, or notaries: but not king's counsel. By the same act, marriages of Papists with Protestants is allowed.

By 33 Geo. III. c. 21. the last and most effectual act passed in Ireland for the relief of the Papists, it is enacted, that no subject being a Papist, or married to or educating children Papists, (taking the oath, &c. required by 13 & 14 Geo. III. c. 35.) shall be liable to any penalty or disability, or to any law for limiting, charging, or discovering, their estates, or touching the acquiring of property, or securities affecting it, save such as Protestants are liable to. And all such parts of oaths required to be taken at voting, or to qualify for voting for members of parliament, as deny the so being a priest, &c. shall not in future be required to be taken by any voter; and such Papists shall not be required, previous to voting, to take oaths of allegiance and abjuration.

By the same act, § 7. it is declared lawful for Papists (taking the oath, &c. required by 13 & 14 Geo. III. c. 35. and an additional oath prescribed by this act, 33 Geo. III.) to hold, exercise, and enjoy, all civil and military offices or places of trust or profits under his majesty in Ireland; and to be a member of any lay body corporate, (except Trinity College, Dublin,) without taking oaths of allegiance, supremacy, or abjuration, &c. With the following exceptions; viz. § 9. Papists are not allowed to sit or

vote in either house of parliament, nor to exercise or enjoy any of the following offices, &c. Lord Lieutenant; Lord Chancellor, Keeper, &c. Lord High Treasurer; Chancellor of the Exchequer; Chief Justice, Chief Baron, or Judge, of the Courts of King's Bench, Common Pleas, or Exchequer; Judge of the Admiralty; Master of the Rolls; Secretary of State; Keeper of Privy Seal; Vice Treasurer, or his Deputy; Teller or Cashier of Exchequer; Auditor General; Lieutenant, Governor, or Custos Rotulorum, of Counties; Secretary to Lord Lieutenant; Privy Counsellor; Prime Serjeant; Attorney or Solicitor General; Second and Third Serjeant; King's Counsel; Master in Chancery; Provost or Fellow of Dublin College; Post Master General; Master and Lieutenant-general of the Ordnance; Commander in Chief of the Forces; General on the Staff; Sheriff or Sub-Sheriff of any County; or any Office contrary to the Act of Settlement and the New Rule, under act 17 & 18 Car. II. And by § 10. Papists are declared not to be enabled to exercise any right of presentation to any ecclesiastical benefice.

By 35 Geo. III. c. 21. an academy was authorized to be established for the education of Papists; in consequence of which the College at Maynooth was founded, and has been from time to time supported by grants from parliament.

The Roman-catholics of Ireland and of England have repeatedly presented petitions to both houses of parliament for the repeal of all disabilities whatever, and for placing the Catholic and Protestant religions upon exactly the same footing, by admitting Catholics into both houses of parliament, and into all offices of state. We have argued this question at great length under the article LIBERTY OF CONSCIENCE, vol. xii. p. 589 & seq. See also LONDON, vol. xiii. p. 250, 284, 292, 328.

PAPISTIC, or PAPISTICAL, *adj.* Popish; adherent to popery.—There are some *papistical* practitioners among you. *Whitgift*.—Ornamenting service-books for the old *papist* worship. *Warton's Hist. E. P.*

PAPISTICALLY, *adv.* In the manner of the papists.

PAPISTICALNESS, *f.* The state of being papistical.

PAPISTRY, *f.* Popery; the doctrine of the Romish church.—*Papistry* as a standing pool, covered and overflowed all England. *Ascham's Schoolmaster*.—A great number of parishes in England consist of rude and ignorant men, drowned in *papistry*. *Whitgift*.

PAPIUCHI, a town, of Mexico, in the province of Mayo: 150 miles north of Santa Cruz.

PAPIZED, *adj.* Popish; adhering to popery.—Protestants cut off the authority from all *papized* writers of that age. *Fuller's Holy War*.

PAPLAH, a town of Asia, and capital of a small country dependent upon Thibet; governed by a raja: ninety miles north of Fyzabad. Lat. 28. 10. N. lon. 82. 53. E.

PAPOU'L (St.), a town of France, in the department of the Aude, before the revolution the see of a bishop; four miles east of Castelnaudary. Lat. 43. 20. N. lon. 2. 7. E.

PAPOZZE, a town of Italy: twenty-two miles north-east of Ferrara.

PAPPAW', a town of Prussia, in the palatinate of Culm: ten miles south-east of Culm.

PAPPENBURG, a seaport town of East Friesland, situated on a canal which communicates with the Ems, and belonging to the kingdom of Hanover. Though but a newly-erected town, it contains 19 yards for ship-building, 2 churches, 400 houses, and 3250 inhabitants: 160 vessels belong to this port, the largest carrying 160 lasts, with about 100 small craft: twenty miles south of Emden. Lat. 53. N. lon. 7. 23. E.

PAPPENHEIM, a town of Bavaria, and capital of a county, in the bishopric of Aichstatt, on the Altmühl. The established and universal religion here is Lutheranism: twelve miles north-west of Aichstatt, and fifteen north-east of Donauwert.

PAPPES'CENT, *adj.* [from the Lat. *pappus*, down.] Growing downy, growing pappous.

PAPPING, a town of Austria: one mile north of Eferding.

PAPPON (John-Peter), an estimable man of letters, was born in 1736 at Pujes near Nice. He entered young into the congregation of the Oratory, where he distinguished himself by his writings. He passed a life in tranquillity, exempt from ambition and intrigue; and his spirits were scarcely affected by the loss of a pension from the states of Provence, which constituted his chief support, at the commencement of the revolution. During the reign of terror he took refuge in the department of Puy-de-Dome, whence he afterwards returned to Paris. He died suddenly in 1801, at the age of sixty-five. Of his works the principal are, 1. An Ode on Death, inserted in the collection of the Floral Games of Toulouse. 2. L'Art du Poete et de l'Orateur, 12mo. several times reprinted. 3. Voyage de Provence, 2 vols. 12mo. 1787: a very agreeable performance, full of historical anecdotes. 4. Histoire de Provence, 4 vols. 4to. To this work many documents are annexed from the ancient historians of Provence. For the purpose of discovering new authorities, the author took a journey to Naples, the throne of which was long occupied by the counts of Provence. Among the pieces which he procured was the quittance given by queen Joan to pope Clement VI. for the price of the city of Avignon, which she sold him. This is supposed to afford a refutation of the assertion that the city was the price of the pope's absolution of Joan from the murder of her first husband; but in fact it proves no more than that an offensive bargain and sale passed between them. 5. Pappon also wrote some pieces relative to the French revolution; and, 6. Epoques memorables de la Peste, 2 vols. 8vo. 1800.

PAPPOPHORUM, *f.* [a genus first established by Schreber, and named by him from the Gr. *παππος*, thistle-down, and *φορος*, to bear; in allusion to the peculiar resemblance of the fine aggregate awns of this grass to the seed-down of many syngenesious plants.] In botany, a genus of the class triandria, order digynia, natural order of gramina, or grasses. Generic characters—Calyx: glume two-flowered, two-valved; valves long, linear, somewhat compressed, very thin, acuminate, awnless: outer a little shorter; one floret inferior, larger, sessile, bearded at the base, hermaphrodite: the other superior, less, on a short pedicel, pressed close to the back of the lower one, beardless, neuter; and above this the rudiment of a third. Corolla: glume two-valved, shorter than the calyx: outer valve ovate, ventricose, angular, terminated by several awns (thirteen or fourteen), very long, straight, unequal, spreading, with its edges embracing the inner valve, which is lanceolate, acute, a little longer and narrower than the outer. Nectary two-leaved, very small, with linear leaflets. Stamina: filaments three, capillary. Antheræ oblong. Pistillum: germen ovate; styles two, short; stigmas villose. Pericarpium: none. Corolla incloses the seed, and lets it drop. Seed one, ovate, compressed, diaphanous.—*Essential Character.* Calyx two-valved, two-flowered; corolla two-valved, many-awned. There are five species.

1. Pappophorum alopecuroides: awns thirteen, minutely toothed. Stem branched, three or four feet high, smooth, sheathed with leaves, which are convoluted, awl-shaped, striated, shorter than the culm; the last spathaceous. Panicle erect, subsplined, often a foot and a half long, resembling Alopecurus monspeliacus. Calyx three or four-flowered. Found by Von Rohr at Spanish Town in South America. *Vahl*, iii. 10. t. 51.

2. Pappophorum nigricans: awns nine, feathery; spike compound, somewhat cylindrical, with imbricated lobes; glumes very finely downy; leaves and sheaths naked, roughish. Gathered by Mr. Brown, in the tropical as well as southern parts of New Holland, and at Port Jackson.

3. Pappophorum pallidum: awns nine, feathery; spike compound, somewhat cylindrical, with imbricated lobes; glumes and leaves villous. Native of the tropical part of New Holland, as well as the two following; Mr. Brown having gathered them all in that country.

4. Pappophorum purpurascens: awns nine, feathery, coloured; spike lanceolate, lobed; its branches alternate, racemose; glumes and leaves downy.

5. Pappophorum gracile: awns nine, feathery; spike divided in the lower part, simple above; glumes downy; leaves involute, smooth, as well as the stems. *Brown, Prodr. Nov. Holl.* i. 184.

PAPPO'SE, or PAP'POUS, *adj.* [*papposus*, low Lat. or from the Gr. *παππος*, thistle-down.] Having that soft light down, growing out of the seeds of some plants; such as thistles, dandelion, hawk-weeds, which buoys them up so in the air, that they can be blown any-where about with the wind: and, therefore, this distinguishes one kind of plants, which is called *papposa*, or *papposi flores*. *Quincy*.—Another thing argumentative of providence is, that *pappous* plumage growing upon the tops of some seeds, whereby they are wafted with the wind, and by that means disseminated far and wide. *Ray on the Creation*.—Dandelion, and most of the *pappous* kind, have long numerous feathers, by which they are wafted every way. *Derham*.

PAP'PUS, *f.* in botany, seed-down: the hairy or feathery, sometimes chaffy, radiating crown of the seed, in the natural order of compound flowers, or syngenesious class, such being the true classical acceptance of this Latin word, as well as of the Greek *παππος*, from whence it comes. The use of this part is to waft the seed to a distance, in dry and windy weather, when the pappus is most light and expanded; by which means such plants are widely dispersed. Finally it either slips off, by the drying and contraction of the summit of the seed, as in thistles; or the seed having fixed itself in the earth, the down is broken off by the wind, or some other accidental cause; in either case the seed is left behind, to germinate without further disturbance. The down, having fulfilled its primary destination, often serves a secondary purpose in the economy of nature; being hoarded up by birds, and the smaller quadrupeds, to compose or to line their nests, or winter retreats. Its texture is not such as to render it fit for being woven, by human art, for any use.

Gærtner properly restrains the term *pappus* to compound flowers; though Linnæus and others use it indiscriminately for such, and for the hairy appendages to the top, sides, or base, of other seeds, even when they are inclosed in a capsule; witness Epilobium, Asclepias, and many others. Gærtner uses the word *coma*, when such an appendage is situated at the top of the seed; and *pubes* when it originates from the base or sides, as in Gossypium, the cotton-plant.

PAP'PUS, a very eminent Greek mathematician of Alexandria in the fourth century, is said by Suidas to have flourished in the reign of Theodosius the Great, who presided over the empire from the year 379 to 395. Such of his works as are still extant, show him to have been profoundly skilled in the mathematical sciences. Suidas and Vossius mention several of his productions which are lost, or at least have not yet been discovered; among which are, 1. A Commentary upon Ptolemy's Almagest. 2. An universal Chorography. 3. A Description of the Rivers of Lybia. 4. A treatise on Military Engines, 5. Commentaries upon Aristarchus of Samos, concerning the Magnitude and Distance of the Sun and Moon, &c. 6. He is quoted by Marinus, a disciple of Proclus, in his preliminary observations on the Data of Euclid, who refers to his Mathematical Collections, in eight books, which are yet extant, in the original Greek, excepting the first and part of the second book, among the rare manuscripts in the Bodleian library at Oxford, and in other collections. Of this work, the third, fourth, fifth, sixth, seventh, and eighth, books, were translated into Latin,

by

by Frederic Commandini of Urbino, and published with a commentary by the editor, Guido Ubaldi, 1588, folio. In 1644, father Mersenne gave a kind of abridgment of them, in his *Synopsis Mathematica*, containing only such propositions as could be understood without figures. At length, the whole of what remains of the Mathematical Collections, was published at Bologna, in 1660, folio, by Carol. Manoleffi, who seems to have spared no labour to render his edition complete and excellent, availing himself of the assistance of very able Greek scholars, and profound mathematicians. On the English reader Dr. Hutton has conferred a favour, by presenting him with a brief analysis of these "Collections," in his *Mathematical Dictionary*, art. *PAPVUS*.

PAPPUS (John), a learned German Lutheran divine and professor, was born at Lindau, on the banks of the lake of Constance, in the year 1549. Having been instructed in the rudiments of the Latin, Greek, and Hebrew, languages at his native place, in the year 1502 he was sent to commence his academical studies at the university of Strasburg. In 1564 he removed to Tubingen, and took his first degree in philosophy; and in 1567 his father sent him to Strasburg to finish his studies. To that object he devoted his attention with great diligence and success, till the year 1569, when he was made minister of the church of Reichoville, though only twenty years of age. His abilities, however, were more mature than his years, and were so well known at Strasburg, that in the year 1570, he was recalled to that city, where he was first of all placed in the chair of Hebrew professor, and soon afterwards appointed professor of divinity, as well as one of the ministers in the church of that place. These preferments were followed by the title of master of philosophy, with which he was honoured by the university of Basil, in 1571. Two years afterwards he went again to Tubingen, and, after performing the requisite exercises in the schools with great applause, was admitted to the degree of doctor of divinity. In 1578, he was made pastor of the principal church at Strasburg; and, in 1581, he was appointed to the superintendence of that ecclesiastical district, which he exercised with great prudence and moderation, and to the entire satisfaction of the clergy who were under his inspection, during twenty-nine years. He died in 1610, in the sixty-first year of his age. He was the author of, 1. *Parva Biblia*, five *Synopsis Biblica*, *Summam continens totius S. Scripturæ methodicè digestam*; 12mo. 2. *Historia ecclesiastica Conversionis Gentium*, 8vo. 3. *Epitome Historiæ Ecclesiasticæ de Conversionibus Gentium, Persecutionibus Ecclesiæ, Hæresibus, et Conciliis Ecumenicis, ex præcipuis Scriptoris Ecclesiasticis collecta*, 8vo. 4. *Homiliæ Academicæ*, 8vo. 5. *Hypotyposis Doctrinæ Christianæ*, five *Institutio Christianæ Religionis de præcipuis quibusdam Articulis*, 8vo. 6. *Germaniæ veteris Descriptiones, ex probatis Auctoribus collectæ*. 7. *Descriptio omnium Regum et Prophetarum populi Indæici*, 8vo. 8. *Index Expurgatorius Librorum qui hoc sæculo prodierunt*, 1699, 12mo. 9. He published, in the original Greek, with an accurate and perspicuous Latin version of his own, a curious monument of antiquity, by an unknown author, entitled, *Συνδικον Περιεχον*; or, *Libellus Synodicus, omnes Synodos, tam Orthodoxas quam Hæreticas, brevi Compendio continens: quæ ab Apostolorum inde Tempore, usque ad octavam, super Unione Photii, et Johannis Papæ, Institutam, sunt celebratæ*, 1601. This work is inserted entire in the eleventh volume of Fabricius's *Bibl. Græc. Gen. Biog.*

PAPPY, *adj.* Soft; succulent; easily divided.—These were converted into fens, where the ground being sprung, sucked up the water, and the loosened earth swelled into a soft and pappy substance. *Burnet*.—Its tender and pappy flesh cannot at once be fitted to be nourished by solid diet. *Ray on the Creation*.

PAP'RA, a town on the west coast of Siam. Lat. 8. 10. N. lon. 98. 30. E.

PAPRE'MIS, or **PAPRIMIS**, in ancient geography, a

town of Egypt, and the capital of the Papremite nome. In this place the hippopotamus was regarded as a sacred animal; and Mars was honoured with a singular ceremony. Upon the festival appropriated to this deity, the priests bore upon a four-wheeled chariot the statue of the god, which was enclosed in a small chapel of gilt wood; and, while they endeavoured to force the chariot and statue into the temple of that divinity, men armed with clubs stood in the way to hinder it; and, as the priests who accompanied the procession had likewise arms, there ensued an engagement, when naturally many people must have lost their lives. The Egyptians, however, maintained that nobody died of the wounds they received upon that occasion.

PAPS, two remarkable hills on the north shore of Lake Superior, in North America.

PAPS (The), mountains of Ireland, in the county of Kerry: eight miles east of Killarney.

PAPS OF JU'RA. See **JURA**.

PAP'UA. See **NEW GUINEA**, vol. viii.

PAP'UDA BA'Y, a bay on the coast of Chili, in the South Pacific Ocean, five leagues north of the shoals of Quintaro, and four from port Liga; the water is deep, the anchorage good, and the entrance safe.

PAPULÆ, *f.* [Latin.] Eruptions of several kinds upon the skin.

PAPULA'RIA, *f.* in botany. See **TRIANTHEMA**.

PAPULOS'ITY, *f.* [from *papula*.] An eruption of pimples on the skin. *Bailey*.

PAP'ULOUS, *adj.* Full of pustules or pimples.

PAP'WORTH (Agnes and Evered), two villages in Cambridgeshire, eleven miles on the west side of Cambridge. The Ermin-street Roman way passes through the latter, from Holm to Huntingdon.

PAP'WORTH (Nether), a village in Huntingdonshire, between Great Paxton and Hilton.

PAPYRIFEROUS, *adj.* [from the Lat. *papyrus*, and *fero*, to bear.] Producing the papyrus. *Cole*.

PAPYR'IUS, *f.* [from *papyrus*.] A name given by Lamarck to the paper-mulberry, in allusion to the use made of its bark, from which most of the East Indian, Japanese, and Chinese, paper is prepared, as well as the cloth of Otaheite, &c. See **MORUS papyrifera**, vol. xvi. p. 49.

PAPYROPOLIST, *f.* [from the Gr. *παπωρως*, paper, and *πωλεω*, to sell.] One that sells paper. *Cole*.

PAPY'RUS, *f.* [Latin.] A kind of flag growing in moist places, which the ancients used instead of paper. See **CYPERUS papyrus**, vol. v.

PAQUASH'E LAKE, a lake of North America. Lat. 50. 48. N. lon. 93. 30. W.

PAQUILIGASTA, a town of South America, in the province of Tucuman: forty miles south-south-west of St. Miguel de Tucuman.

PAR, a river of Bavaria, which runs into the Danube four miles below Ingoldstadt.

PAR, *f.* [Latin.] State of equality; equivalence; equal value. This word is not elegantly used, except as a term of traffic.—To estimate the *par*, it is necessary to know how much silver is in the coins of the two countries, by which you charge the bill of exchange. *Locke*.—Exchequer-bills are below *par*. *Swift*.—My friend is the second after the treasurer; the rest of the great officers are much upon a *par*. *Swift*.

PARA, *f.* A small Turkey coin, forty of which are equal to a piastre; and contains three aspers.

PARA, *f.* A measure, in India, equal to five pecks, or 34 lb. 8 oz. 12 drams.

PARA, [signifying First or Greatest.] The name the Hindoo goddess Parvati, in her character of **PRAKRITI**; which see.

PARA, or **GRAND PARA**, the most northern of the colonies or governments of Brazil, in South America. This province comprehends that part of Guiana which belongs to the Portuguese, on the north side of the river Amazon, extending from the union of the river Madeira to

to the Atlantic, about 606 miles from east to west, and 200 from north to south. It produces abundance of cotton, sugar, vanilla, chocolate, coffee, and tobacco: a fleet laden with these articles has usually failed every year for Lisbon. The climate is extremely hot; and the woods abound with valuable timber of great solidity and brilliant colours, and some trees that yield odorous balsams. This province contains about 150,000 inhabitants.

PARA, the capital of the above jurisdiction, is situated at the mouth of the great river Tocantin, which receives that called Dos Bocas, into which a natural canal from the Maranon has been opened by the violent tides. This is a rich and handsome town, with two parish-churches, a college, and 15,000 inhabitants. Besides a citadel, it has a fortress, with a strong train of artillery, and a garrison of four companies. Lat. 1.45. S. lon. 50. W.

PARA, a river of Brasil, formed by the union of the Tocantin and the Guanapa. It is a large river, and runs about 120 miles in a north-easterly direction, separating the island of Marajo from the continent, and emptying itself into the Atlantic about twenty miles south of the line.

PARA, a river of Brasil, which rises about 150 miles west of Villarica, and runs into the St. Francisco in lat. 16. 50. S.

PARA, a town of Turkish Armenia: ninety miles north-north-east of Cars.

PARA HO'TUN, a town of Chinese Tartary, on the river Kerlon: 512 miles north of Pekin. Lat. 43. 6. N. lon. 113. 14. E.

PARABIT'TA, a town of Naples, in the province of Otranto: ten miles north-west of Alessano.

PAR'ABLE, *f.* [παράβολον, Gr. formed from παράβαλεν, to oppose, or compare.] A fable or allegorical instruction, founded on something real or apparent in nature or history; from which a moral is drawn, by comparing it with some other thing wherein the people are more immediately concerned.—In the *parable* of the talents, our Saviour plainly teacheth us, that men are rewarded according to the improvements they make. *Nelson*.

What is thy fulsome *parable* to me?

My body is from all diseases free.

Dryden.

Some make *parable* differ from fable; Grotius and others use the two terms promiscuously. Kircher derives the use of *parables* from the Egyptians.

Parable, according to the eminently-learned bishop Lowth, (Lectures on the Sacred Poetry of the Hebrews,) is that kind of allegory which consists of a continued narration of a fictitious event, applied by way of simile to the illustration of some important truth. The Greeks call these allegories *αἰναι*, or apologues; the Latins *fabule*, or fables: and the writings of the Phrygian sage, or those composed in imitation of him, have acquired the greatest celebrity. Nor has our Saviour himself disdained to adopt the same method of instruction, of whose *parables* it is doubtful, whether they excel most in wisdom and utility, or in sweetness, elegance, and perspicuity. This species of composition occurs very frequently in the prophetic poetry, and particularly in that of Ezekiel. If to us they should sometimes appear obscure, we must remember, that in those early times, when the prophetic writings were indited, it was universally the mode throughout all the eastern nations to convey sacred truths under mysterious figures and representations.

It is the criterion of a *parable*, that it be consistent throughout, and that the literal be never confounded with the figurative sense; and in this respect it materially differs from that species of allegory called the *continued metaphor*. (See Isaiah, v. 1-7.) It should be considered that the continued metaphor and the *parable* have a very different view. The sole intention of the former is to embellish a subject, to represent it more magnificently, or at the most to illustrate it; that, by describing it in more elevated language, it may strike the mind more for-

cibly: but the intent of the latter is to withdraw the truth for a moment from our sight, in order to conceal whatever it may contain ungraceful or disgusting, and to enable it secretly to insinuate itself, and obtain an ascendancy as it were by stealth. There is, however, a species of *parable*, the intent of which is only to illustrate the subject; such is that remarkable one of Ezekiel, (chap. xxxi.) of the cedar of Lebanon; than which, if we consider the imagery itself, none was ever more apt or more beautiful; of the description and colouring, none was ever more elegant or splendid; in which, however, the poet has occasionally allowed himself to blend the figurative with the literal description, (see ver. 11, 14-17.) whether he has done this because the peculiar nature of this kind of *parable* required it, or whether his own fervid imagination alone, which disdained the stricter rules of composition, was his guide, our learned author can scarcely presume to determine.

In the New Testament, the word *parable* is used variously. In Luke iv. 23. for a proverb, or adage; in Matth. xv. 15. for a thing darkly and figuratively expressed; in Heb. ix. 9, &c. for a type; in Luke xiv. 7, &c. for a special instruction; Matth. xxiv. 32. for a similitude or comparison.

Parables, or *similitudes*, are of two sorts, simple and compound. Those are called *simple*, in which one thing only is likened or compared to another in this manner: as swallows appear in summer, but in winter retreat; so false friends show themselves in prosperity, but fly all away, when adversity approaches. *Compound similitudes* are such wherein one thing is likened or compared to several others; as thus: What light is to the world, physic to the sick, water to the thirsty, and rest to the weary; that is knowledge to the mind. The more exact the agreement is between the things compared, they give the greater beauty and grace to the figure. *Ward's Orat.* vol. ii.

To PAR'ABLE, *v. a.* To represent by a *parable*.—That was chiefly meant, which by the ancient sages was thus *parabled*. *Milton's Doct. and Disc. of Div.*

PAR'ABLE, *adj.* [from *paro*, Lat. to prepare.] Easily procured. *Not in use*.—They were not well withers unto *parable* physic, remedies easily acquired, who derived medicines from the phoenix. *Brown*.

PARAB'OLA, *f.* [Latin.] A curve line arising from a cone's being cut by a plane parallel to one of its sides, or parallel to a plane that touches one side of the cone. See CONIC SECTIONS, vol. v.—Had the velocities of the several planets been greater or less than they are now, at the same distances from the sun, they would not have revolved in concentric circles as they do, but have moved in hyperbolas or *parabolas*, or in ellipses very excentrick. *Bentley's Serm.*

PARABOL'IC, or PARABOLICAL, *adj.* [from *parable*.] Expressed by *parable* or *similitude*.—The scheme of these words is figurative, as being a *parabolical* description of God's vouchsafing to the world the invaluable blessing of the gospel by the *similitude* of a king. *South*.—Having the nature or form of a *parabola*; [from *parabola*.]—The pellucid coat of the eye doth not lie in the same superficies with the white, but riseth up a hillock above its convexity, and is of an hyperbolical or *parabolical* figure. *Ray*.—The incident ray will describe, in the refracting medium, the *parabolic* curve. *Cheyne's Phil. Prin.*

PARABOL'ICALLY, *adv.* By way of *parable* or *similitude*.—The words, notwithstanding *parabolically* intended, admit no literal inference. *Brown's Vulg. Err.*—In the form of a *parabola*.

PARABOL'ICALNESS, *f.* The state of being *parabolical*.

PARABOL'IFORM, *adj.* Having the form of a *parabola*.

PARAB'OLISM, *f.* In algebra, the division of the terms of an equation, by a known quantity that is involved or multiplied in the first term.

PARABOLOID, *f.* A paraboliform curve in geometry, whose ordinates are supposed to be in subtriplicate, subquadruplicate, &c. ratio of their respective abscissæ. There is another species; for, if you suppose the parameter, multiplied into the square of the abscissa, to be equal to the cube of the ordinate; then the curve is called a semicubical *paraboloid*. *Harris*.

PARABOSCO (Girolamo), an Italian poet and miscellaneous writer, was born towards the beginning of the sixteenth century at Placentia. He appears to have been a musician by profession, and a maestro di capella. He wrote several comedies in prose and verse, which are said to possess a character of originality. He also composed a tragedy, entitled "Progne," printed at Venice in 1548. At the same place was printed in 1558 "Gli Disporti di Girolamo Parabosco," consisting of novels in the manner of Boccaccio and Bandello. He likewise published "Letters," and other works now forgotten.

Doni speaks very highly of this Parabosco, both as a writer and a musical composer and performer: "Whoever (says he) is endowed by heaven with the power of receiving and communicating pleasure, should imitate Parabosco; who, not content with that musical excellence, with which he has given such delight, both in public and private, and acquired such fame, has afforded equal pleasure by his literary and poetical talents, in the publication of works that are as much esteemed for their wit and learning as originality." Dr. Burney, whose curiosity was raised by this account, procured several of his musical compositions, as well as his *Disporti*, or Novels; which last he "purchased at an extravagant price, as curiosities, at the sale of the late Hon. Topham Beauclerc's books; but found, on perusal, that Doni spoke of them, as he did perhaps of his musical abilities, with the partiality of a friend. Some of the motets and madrigals he took the trouble to score, but found in them no subject, and but little design or contrivance; and, if his literary character did not impose on his friends, and on the writers who speak of his musical productions, his fame as a composer must have been established on some lost works superior to these, which are mere remplissage, or notes heaped on each other totally devoid of meaning with respect to melody."

PARABRAMA, a name given to the first of the gods of India.

PARABYS'TE, one of the five principal civil tribunals of Athens.

PARAC, a town of the island of Borneo: 200 miles north of Banjar Massim.

PARACA, a town of Peru, in the audience of Lima: twelve miles south of Pisco.

PARACALE, a town of the north coast of the island of Luçon. Lat. 14. 29. N. lon. 123. 19. E.

PARACELS. See **PRACELS**.

PARACELSIAN, *f.* A physician who follows the practice of Paracelsus.—The *Paracelsians* do use to give their patients, in this case, a kind of gentle vomit. *Ferrand on Love Melancholy*.

PARACELSIAN, *adj.* Denoting the medical practice of Paracelsus.—Joining the Galenical and *Paracelsian* physick together, making use of them both as occasion serves. *Hakewill on Providence*.

If that the *Paracelsian* crew
The virtues of this liquor knew,
Their endless toil they would give o'er,
And never use extractions more. *Nabbes's Poems*, 1639.

PARACEL'SUS, an extraordinary adventurer in chemistry and physic, is said to have been born at Einsieden, a little village near Zurich, in Switzerland, in 1493; and his father, called William de Hohenheim, is supposed to have been the natural son of a grand master of the Teutonic order, and a practitioner in medicine in Carinthia. With a view of dignifying himself and his family, his son assumed the names of *Philippus Aureolus Theophrastus*

Paracelsus Bombastus de Hohenheim. But Thomas Erastus affirms, that there was no family bearing any of these names in that part of Switzerland, either noble or ignoble; and Haller was credibly informed, that Paracelsus was a native of Gais, in the canton of Appenzel, and of an obscure family of the name of Hochener, which was still existing there. His father gave him early a turn for his own pursuits, and put him under the care of John Tritheimus, abbot of Spanheim, at that time eminent for his knowledge of the *spagirie art*, as chemistry in its infancy was called. He afterwards followed another master of the art, Sigismund Fugger; and from both these he learned many secrets. If any credit is due to his own statements, he received instructions from several other tutors, whom he has named; although, in one of his treatises, he denies having had any instructors at all.

He very soon commenced a sort of rambling life; for he says, he had examined the principles of the medical art with great attention, and found them defective and erroneous in all points; and therefore he resolved, after having visited the schools of France, Italy, and Germany, to travel in pursuit of medical truth, and not only to search for it among physicians and other learned persons, but among barber-surgeons, monks, conjurors, old women, and quacks of every description. He makes a pompous display of the names of all the countries which he thus visited, during a peregrination of several years, and of the important acquisitions in science which he thus collected, with the view of impressing on the world the highest opinion of his superiority; for he seems to have possessed the talents of imposing and successful quackery in an eminent degree. Even the learned Erasimus appears to have consulted him, especially after a fortunate cure of his friend Frobenius, the celebrated printer of Basle, in an attack of gout, (although the latter died of apoplexy a few months afterwards;) and Oporinus, an eminent citizen of that place, left his family to follow him. In the course of his travels he had doubtless collected much information concerning metallic chemistry; which, however, he perverted to the vain search of the philosopher's stone; and, by the bold use of some active medicines, especially mercury and opium, the administration and properties of which were not understood by medical men, he had certainly effected many cures, where ordinary medicine had failed; and, while these successful cases were blazoned forth with the usual exaggeration, the unsuccessful ones, and the mistakes, were long passed over in silence. To such a height, however, his reputation had been raised in Switzerland, that the magistrates of Basle were induced to engage him, at a large salary, to fill the chair of medicine in their university. In the years 1527 and 1528, he gave lectures daily, sometimes in barbarous Latin, but more frequently in German; and, although he at first acquired several enthusiastic adherents, yet the barbarism, vanity, and extravagance, of his lectures, at length disgusted the students, and he was soon left without an audience. Indeed nothing could exceed the ridiculous pride and bombast with which he assumed the supremacy, the monarchy, of medicine, and the contempt which he affected towards all the teachers and universities in the world. Seated in his professorial chair, at his first lecture he publicly burnt the works of Galen and Avicenna, averring that his cap contained more knowledge than all physicians, and that the hair of his beard had more experience than all the universities: "Greeks, Romans, French, and Italians," he exclaimed; "you Avicenna, you Galen, you Rhazes, you Mesue; you doctors of Paris, you of Montpellier, you of Swabia, you of Misnia, you of Cologne, you of Vienna; and all you throughout the countries that are washed by the Danube and the Rhine, and you who inhabit the islands of the sea, Athenian, Greek, Arab, and Jew; you shall follow and obey me; I am your king; the monarchy of physic is mine," &c. That such an extravagant enthusiast should not long retain his professorial chair might be

anticipated. A quarrel with the magistrates of Basle, on account of a decision against him in respect to a demand of fees, which was deemed exorbitant, increased his displeasure, and he suddenly quitted that place in 1528. From this time he resided chiefly in Alsace, and in different parts of Germany, leading a life of extreme intemperance, in the lowest company, being frequently in a state of continued intoxication for many days and nights in succession. Nevertheless he still maintained his reputation by the cures occasionally effected by his powerful remedies, though his failures were equally conspicuous. But the most signal failure of his boasted remedies occurred in his own person; for, after pretending to the power of extending human life to an indefinite limit by virtue of his *elixir*, he died in 1541, at an inn at Saltzburg, in the forty-eighth year of his age, in consequence of an attack of fever, and was buried in the hospital of St. Sebastian, to which he bequeathed the little property he possessed.

Notwithstanding the reputation, and the numerous eulogies bestowed on this singular man, it can scarcely be said that either scientific chemistry or medicine is much indebted to him for its advancement. The fundamental doctrines of his chemistry, which resolved every thing into *three elements*, salt, sulphur, and mercury, and which were for a long time received, were, in fact, borrowed from his predecessor, Basil Valentine. As to his medical skill, it consisted principally in the bold administration of some powerful remedies, which had been heretofore thought too dangerous to be used. His most favourite medicine was *opium*, a drug with which, it is obvious, he would be able in many instances to afford great and speedy relief; but with which also few permanent cures could be effected, and much mischief would necessarily be produced when it was misapplied. Antimony and mercury were also medicines which he liberally prescribed, and he used various preparations of them of the most active kind. He was indeed one of the first to employ mercury for the cure of the venereal disease; and of course he must, in this severe and newly-distinguished malady, have been successful in a degree to which none of his contemporaries, who did not resort to that remedy, could attain: and this success was a source of considerable emolument. In fact, he must be allowed to have conferred a substantial benefit on mankind, by the introduction of mercury as a cure of this malady: and in this point consists his principal merit in respect to medicine; for his total ignorance of anatomy and rational physiology, his inability from want of literature to investigate the doctrines of the ancients, which he so boldly impugned, and his employment of a barbarous jargon, as well as his infatuated notions of magic, astrology, geomancy, and all the other branches of mystical imposture, are totally adverse to any claim on his part to the improvement of medical science; and indeed he appears to have been entirely destitute of clear and methodical views upon any subject. We shall not pretend therefore to enter into any detail of the unintelligible jargon and absurd hypotheses which he employed, or to enumerate the immense farrago of treatises which made their appearance under his name after his death, the notices of which occupy above nine quarto pages in the Bibliotheca of Halle: for the first we are unable to comprehend, and the latter would be a waste of time. The most complete edition is that of Geneva, in three volumes folio, 1658. He published little while he lived.

PARACENTE'SIS, *f.* [from *παράπνεω*, Gr. to make a perforation.] A term in surgery, signifying the operation of tapping, or making an opening into the thorax, abdomen, or bladder, for the purpose of discharging the fluid confined in these parts in cases of empyema, hydrothorax, ascites, and retention of urine. See the article **SURGERY**.

PARACEN'TRIC, or **PARACENTRICAL**, *adj.* [*παρα*, beside or out of, and *κεντρον*, centre.] Deviating from circularity.—Since the planets move in the elliptick orbits,

in one of whose foci the sun is, and, by a radius from the sun, describe equal areas in equal times, we must find out a law for the *paracentric* motion that may make the orbits elliptick. *Cheyne's Philos. Prin.*

PARA'CHO, a town of Hindoostan, in the circar of Gohud: fifteen miles north of Narwa.

PARACH'RONISM, *f.* [from the Gr. *παρα*, beside, and *χρονος*, time.] False chronology; error in the computation of time.

PARACHUETE'AS, a town of West Florida, near the Apalachicola. Lat. 31. 24. N. lon. 85. W.

PARACHU'RECOIL, a town of Hindoostan, in Marawar: seven miles north-west of Tripatore.

PARACHUTE, *f.* [French; from *para*, against, and *chute*, fall.] A machine in the form of an umbrella, sometimes annexed to an air-balloon, and sometimes used separately, and serving to buoy up a heavy body in its ascent, or to prevent its precipitate fall (as its name imports) in the atmosphere. Umbrellas have been used for this purpose from remote times in various parts of the East Indies. In the "Historical Relation of the Kingdom of Siam," by M. de la Loubere, who visited that country in the years 1687 and 1688, we have an account of the manner in which umbrellas were employed in the diversions of the court of Siam. "There died one," says this writer, "some years since, who leaped from a hoop, supporting himself only by two umbrellas, the handles of which were firmly fixed to his girdle: the wind carried him accidentally sometimes to the ground, sometimes to trees or houses, and sometimes into the river. He so exceedingly diverted the king of Siam, that this prince had made him a great lord, he had lodged him in the palace, and had given him a great title, or, as they say, a great name."

This very dangerous amusement has been but lately exhibited among us. When the novelty of common ascents and descents with air-balloons began to wear off, Mons. Garnerin, a Frenchman, was, as we believe, the first who tried the experiment of descending under a parachute after detaching himself from his balloon. This was first performed in London in the year 1802. See **AIR-BALLOON**, vol. i. p. 220. (last edit.) A young lady, his daughter, performed the same intrepid feat at Paris on the 17th of March, 1815; and again, at Bourdeaux, on the 8th of February, 1818. She cut the rope when about 200 toises (1200 feet, near a quarter of a mile) from the ground.

PARACLE'TE, *f.* [*παράκλητος*, Gr. comforter, or advocate.] The title of the Holy Ghost; the intercessor, by way of distinction.—Whereas we know not what we should pray for as we ought, the Spirit itself maketh intercession for us with groanings which cannot be uttered; and he that searcheth the hearts knoweth what is the mind of the Spirit, because he maketh intercession for the saints according to the will of God. From which intercession especially I conceive he hath the name of the *Paraclete* given him by Christ. *Pearson on the Creed*.

Immortal honour, endless fame
Attend the Almighty Father's name:
The Saviour Son be glorify'd,
Who for lost man's redemption dy'd:
And equal adoration be,
Eternal *Paraclete*, to thee.

Dryden.

Any advocate or intercessor.—Bragging Winchester, the pope's *paraclete* in Englande, that is mayster of the stewes at London. *Bale on the Rev.*—He strengtheneth that conceit of the *paraclete*; by whom if he mean Montanus the arch-heretick, we need not much envy the cardinal for raising up so worshipful a patron of his purgatory. *Abp. Usher's Answer to the Jesuit Malone*.

PARAC'ME, *f.* [Gr. declension; from *παρα*, beyond, and *ακμη*, vigour, strength, or height.] Any thing past its height, or perfection. That part of life in which a person is past his full vigour; the vale of life.

PARACU'SIS,

PARACUSIS, *f.* [from the Greek.] Depraved hearing. The term is not applied to simple deafness, that is, to a mere diminution or abolition of the sense of hearing; but to those varieties of imperfect hearing, in which all sounds are heard incorrectly; as for instance, with hissing, ringing, or other noises; and to over-acute as well as obtuse powers of hearing. See Cullen's *Nofol. Meth.* Gen. 97.

PARADAN'GA, a town of Bengal: twenty-five miles east-north-east of Rungpore.

PARA'DE, *f.* [Fr. from *parata*, *paratura*, low Lat. ornaments. Our word was probably not admitted into use before the middle of the seventeenth century. Milton's is the earliest of Dr. Johnson's examples. Bishop Taylor writes it *parada*. "Nor may this be called an histrionike *parada*, or stagely vizard." Artif. Handsomeness, 1656. *Todd*.] Show; ostentation.—He is not led forth as to a review, but as to a battle; nor adorned for *parade*, but execution. *Granville*.

Be rich; but of your wealth make no *parade*,
At least before your master's debts are paid. *Swift*.

Procession; assembly of pomp:

The rites perform'd, the parson paid,
In state return'd the grand *parade*. *Swift*.

Military order:

The cherubim stood arm'd
To their night-watches in warlike *parade*. *Milton*.

Place where troops draw up to do duty and mount guard.—The place of trumpets and kettle-drums, of horse and foot guards, the *parade*. *Warburton's Letters to Hurd*.—Guard; posture of defence.—Accustom him to make judgment of men by their inside, which often shows itself in little things, when they are not in *parade*, and upon their guard. *Locke on Education*.—A public walk.—The *parade* originally consisted of a square court before cathedrals, surrounded with piazzas or porticoes for persons to walk under, being supported with pillars. It is now used, in a military sense, to signify any place where troops assemble, and may be distinguished in the following manner:

General PARADE, the place where soldiers belonging to different corps are drawn up, according to seniority, to mount guard, or to be exercised, &c.

Regimental PARADE, the place where any particular regiment or corps is formed in line, &c.

Private PARADE, any spot selected (in general by each captain of a troop or company) for the inspection of his men, previous to their being marched off to the regimental parade. This parade is likewise called *company* or *troop parade*. When troops are encamped, the general and regimental parades are usually in front of the line of tents; each regiment having its quarter-guard opposite, and the space between being sufficient to allow of the free exercise of the battalion. The companies have their private parades in the several streets of the camp. *James's Mil. Dict.*

PARADE-OFFICER, an officer who attends to the minutiae of regimental duty, but who is not remarkable for military science. *James's Mil. Dict.*

PARA'DE, *f.* [French.] In fencing, is the action of parrying or turning off any push or stroke. This is merely a French word.—There are as many kinds of *parades* as of strokes and attacks; as the *parade* inward, outward, above, below, feigned, &c. *Chambers*.

To **PARA'DE**, *v. n.* To go about in military procession:
I hate that drum's discordant sound,
Parading round and round and round. *Scott of Amwell*.
To assemble together for the purpose of being inspected or exercised.

To **PARA'DE**, *v. a.* To exhibit in a showy or ostentatious manner.

PARA'DE (La), a town of France, in the department of the Lot and Garonne; six miles east of Tonneins.

PARA'DE DE BOU'RO, a town of Portugal, in the province of Entre Duero e Minho: sixteen miles north-north-east of Braga.

PARADELLA, a town of Portugal, in the province of Beira: twelve miles south-east of Lamego.

PARA'DES, a town of Spain, in the province of Seville: five miles south of Carmona.

PARADIES, a town of Prussia, in the province of Oberland: two miles south-west of Mohrungen.

PARADIG'M, *f.* [from the Gr. *παρά*, by the side of and *δεινμι*, to show.] An illustration by an example. A model.—The archetypal *paradigm*, the idea of ideas, or form of forms. *More's Song of the Soul*.—Your Greek too, I dare say, keeps pace with your Latin; and you have all your *paradigms* ad unguem. *Chesterfield*.

PARADIGMA'TICAL, *adj.* Exemplary.—Those virtues that put away quite and extinguish the first motions, are *paradigmatical*; that is, virtues that make us answer to the paradigm or idea of virtues exactly, viz. the intellect of God. *More's Song of the Soul*.

To **PARADIG'MATIZE**, *v. a.* To set forth as a model or example.—There is no one question concerning any line in those books so *paradigmatized* by you, or in any piece of divinity wherein I understand aught, but you or any man shall for the least asking have the full sense of your servant, H. Hammond. *Hammond to Cheyne*.

PAR'ADIN (William), an industrious French author, who flourished in the 16th century, but of whose personal history little more is known than that he was living about the year 1581. His most important works were, 1. The Chronicle of Savoy. 2. Aristæus's History of the Septuagint. 3. History of his own Time. 4. Memoirs of the City of Lyons.

PAR'ADIS, a village of Switzerland, on the left bank of the Rhine: two miles east of Scaffhausen.

PAR'ADISE, *f.* [*παράδεισος*, Gr. a garden.] The blissful regions in which the first pair was placed.—*Paradise* is in Hebrew פֶּרֶדֶס, *pardès*, from פָּרַד, to divide, to set apart; so that the real meaning of the word is a "sequestered retired place," which sense agrees exactly with the purpose for which the *pardès* was created. *Gleanings in Etymology*, now preparing for the press.

Longer in that paradise to dwell

The law I gave to Nature him forbids. *Milton*.

As to the *terrestrial paradise*, there have been many enquiries about its situation. Some, as Hardouin, &c. will have it in Judea, in the place where now is the lake Genesareth; others, as Le Clerc, &c. in Syria, towards the springs of the Orontes, and Chrysorrhoe; but in neither of those places do we discover any track of the rivers with which the paradise in Moses's description was watered. Calmet, and some other ingenious critics, have placed the terrestrial paradise in Armenia, near Mount Ararat, where Noah's ark was left; and imagine they there discover the sources of the four rivers which watered the garden of Eden, viz. Euphrates; Hiddekel, now the Tigris; Gihon, now Araxes; and Pison, now Phazzo. But sir J. Chardin assures us, in his *Travels*, that the Phazzo springs out of the mountains of Caucasus, northward of the kingdom of Imereti, and far enough from Mount Ararat: besides, that in Armenia we have no signs of the countries of Havila and Ethiopia, which those rivers washed after their departure from Eden.

There are various other opinions, as to this point: Poffellus will have paradise placed under the North Pole! grounding his notion upon an ancient tradition of the Egyptians and Babylonians, that the ecliptic or sun's way was at first at right angles to the equator; and so passed directly over the North Pole. Others are against limiting it to any one place, and contend, that it included the whole face of the earth, which was then, as it were, one continued scene of pleasures, till altered upon Adam's transgression. However, both these opinions are equally incompatible with the account in the book of Genesis.

Others,

Others, as Origen, Philo, &c. interpret the Scripture relation of paradise allegorically.

"Learned men," says Mr. Milne in his *Physico-Theological Lectures*, "have laboured to find out the situation of paradise, which seems to be but a vague and uncertain inquiry; for the Mosaic description of it will not suit any place on the present globe. He mentions two rivers in its vicinity, viz. Pison and Gihon, of which no vestiges can now be found. The other two still remain, viz. the Hiddekel, supposed to be the Tigris, and the Euphrates, whose streams unite together at a considerable distance above the Persian gulf; in some part of which, it is highly probable the happy garden once lay. This gulf is eastward both of the land of Midian and the wilderness of Sinai; in one of which places Moses wrote his history. But, since the formation of this earth, it has undergone great changes from earthquakes, inundations, and many other causes. The garden, however, seems to have been a peninsula, for the way or entrance into it is afterwards mentioned. We are told that a river *went out of it*; which, according to some, should be rendered 'ran on the outside of it,' and thus gave it the form of a horse-shoe: for, had the Euphrates run through the middle of the garden, one half of it would have been useless to Adam, without a bridge or boat wherewith to have crossed it."

The learned authors of the *Universal History*, in their account of rarities natural and artificial in Syria, mention "a spot which is still shown as the place where once stood the Garden of Eden, or terrestrial paradise; and indeed it is in all respects so beautiful and rich, and yields so delightful a prospect from the adjacent hills, that there is hardly another place in the world that has a fairer title to the name it bears. Its proximity to Damascus, the capital of Syria, near the fountain-head of the Jordan; its situation between the Tigris or Hiddekel, the Euphrates, the Phasis or Pison, the Araxes or Gihon (which last has those names from its vast rapidity above all other known rivers), its bordering upon the land of Chus, famed for its fine gold; all these and many other marks specified by Moses, together with its charming and surprising fruitfulness, and constant verdure, have induced a great number of commentators to settle that celebrated and so much sought-after spot here.

But the most common and probable opinion is that of Hopkinson, Huet, Bochart, &c. who place paradise in Chaldea between the confluence of the Euphrates and Tigris, and their separation. Here we find two of Moses's rivers by name; and below, we find the stream was parted into two large divisions, the eastern one of which may have been the Gihon, and the western the Pison. Ethiopia, one of the countries which these rivers washed, was incontestibly Arabia Deserta; for Moses calls his wife, who was of this country, an Ethiopian; and Havilah, the other country, must have been the Chusistan in Persia; where were anciently found gold, bdellium, the onyx, &c. mentioned in Moses's description. The difficulty in this system is, that Moses speaks expressly of four rivers, each of which had its source in the garden of Eden; whereas this gives us only two rivers, which were separated into four branches.

PARADISE is also used in the New Testament, and by Christian writers, for the final habitation of the blessed, or Heaven.—Heaven is called a *paradise*, because of the complete happiness, manifold delights, and intimate fellowship with God, that are there enjoyed. *Brown's Dict. of the Bible*.—Hence,

PARADISE is likewise taken for any place of felicity.—If ye should lead her into a fool's *paradise*, it were very gross behaviour. *Shakespeare's Rom. and Juliet*.

Why, Nature, bower the spirit of a fiend
In mortal *paradise* of such sweet flesh. *Shakespeare*.

PARADISE (Mahometan). See MAHOMETANISM, vol. xiv. p. 141.

PARADISE, a township of America, in Pennsylvania, in the county of York, containing 1548 inhabitants.

PARADISE (Bird of). See PARADISEA.

PARADISE SOUND, a bay on the south-west part of Placentia, on the coast of Newfoundland. Lat. 47. 30. N. lon. 54. 15. W.

PARADISEA, *f.* The BIRD of PARADISE; a genus of the order picæ, of which the generic characters are—Bill covered with a belt of downy feathers at the base; feathers of the sides very long; two of the tail-feathers naked; feet large and strong. These birds chiefly inhabit New Guinea, from which they migrate in the dry season into the neighbouring islands. Their feathers are used in those countries as ornaments for the head-dress; and the Japanese, Chinese, and Persians, import them for the same purpose. Among the latter, the principal people attach these brilliant collections of plumage, not only to their own turbans, but to the housings and harness of their horses.

1. *Paradisea apoda*, the greater bird of paradise: chestnut; neck beneath gold-green; feathers on the sides longer than the body; the two middle tail-feathers long and bristly. (There is a variety which is less, and the body above is yellow; the feathers on the sides are yellowish-white.) The two long tail-feathers are naked, straight, and tapering to the tip; the tail, as it is improperly called, is nothing more than the long feathers of the back and sides. These birds are found in the Molucca islands, and those surrounding New Guinea, particularly in Aroo, where they arrive with the westerly or dry monsoon, and whence they return to New Guinea, when the easterly or wet monsoon sets in. They are seen going and returning in flights of thirty or forty, conducted by a leader, which flies higher than the rest. During this flight they cry like starlings. By a sudden shifting of the wind, their long scapular feathers are sometimes so dishevelled as to preclude flying, when they fall to the ground, or are lost in the water. In the former case they cannot rise again into the air, without gaining an eminence; and are secured by the natives, and killed on the spot, as they cannot be preserved alive by art. They are likewise caught with birdlime, or shot with blunt arrows, or are sometimes intoxicated with the berries of *Menispermum cocculus* put into the water which they are accustomed to drink. Their real food is not known with certainty. According to some authors, they feed on the red berries of the *Ficus benjamina*, or waranga-tree; according to others, they are particularly fond of nutmegs; some assert they live on large butterflies and moths, and others that they chase and devour small birds.

No bird has given rise to more fables than this. Its residence was said to be in the earthly paradise. It was believed by the credulous and ignorant, that it lived alone upon the air and the dew; that it had no entrails, nor feet; but remained perpetually floating upon the air, while sleeping, as well as while awake; while hatching and laying, as well as while procreating its young. Instead of a stomach and intestines, which, to so extraordinary a feeder, would have been useless, the cavity of its abdomen was said to be filled with fat. The truth is, the hunters who procure and sell these birds, take out their entrails, the better to preserve and carry them, and perhaps too with a view to perpetuate the belief of those fables, which they have found so beneficial to their trade.

If any thing could give an air of probability to the perpetual flying of the bird of paradise, it might be its extraordinary lightness. A bird no larger than a thrush, swelled to an immense bulk by its feathers, is rendered specifically lighter than any other. "These feathers (says Vaillant) proceed from the sides, pass beyond the tail, with which they are blended, and form behind it a mass of extreme tenuity, light and transparent as air. Naturalists distinguish them by the epithet *subalarian*, because they have their origin under the wings. Their

total amount exceeds 600, though Buffon mentions only 40 or 50 on each side. I have had the patience to count them in fifty individuals, all very entire; and I have reckoned from 260 to 310 on a side. Their forms, colours, and natures, vary according to their positions. The largest measure from twenty to twenty-two inches in length, and have long downy beards, which are so many small feathers, with their complete complement of beardlets, perfectly visible. They are of a bright-brown colour, and terminate in a long hairy filament. The secondary, which cover the first, have smooth and glossy beards, and are of a beautiful jonquil yellow. The third set is composed of feathers, similar to the secondary, which they cover. They are very narrow, present the same yellow hue at their bases, and are tipped with a glowing purple, finely contrasting with the yellow ground on which they are distributed by gradations, the smallest occupying the upper range. The space on the side between the thighs and breast, which is covered by all these subalarian feathers, scarcely exceeds two square inches. These gaudy appendages are closely pressed on one another, and imbedded so deeply, that their quills are visible through the skin, which they completely transpire; thus proving their insertion in an extensor muscle, which enables the bird to erect them at pleasure, like the peacock when he displays the glories of his rump-feathers, vulgarly and very improperly called his tail. This latter appellation has been also frequently bestowed on the subalarian plumage of the bird of paradise, though he has a distinct and very beautiful tail."

In some parts of India, the feathers of this bird bring a great price. They are extremely well suited for the ornaments of dress, both by their lightness and their lustre. About a century ago, they were employed in Europe for the same purposes for which those of the ostrich are now purchased.

What renders this bird still more remarkable, is two long naked feathers, like threads, that arise in the uropigium, above the false tail already described. These are of an enormous length, extending above a foot beyond the longest of that large mass. The head, back, and breast, of these birds, are covered with short straight feathers, which, to the touch, are soft like velvet. They are of different colours, and so changeable in their hue, that they vary continually, according to the different points from which they are viewed.

Belon pretends that the bird of paradise is the same with the phoenix of the ancients; but the countries which they inhabit are too distant for such an hypothesis; Egypt being the habitation of the latter, and the eastern parts of Asia that of the former. These notions, then, says Dr. Forster, are to be explained by the theology of Egypt. Though the birds of paradise were never known to the ancients, and though what has been said by the Egyptian priests concerning the fabulous phoenix, has but little agreement with the bird of paradise, yet it is remarkable that the names applied both by the Indian and European nations to these birds, appear to attribute something of a supposed celestial origin to them. In all probability, says Dr. Shaw, this notion has arisen merely from their transcendent beauty, and the singular disposition and delicacy of their plumage.

Margrave has inserted a description of this species in his History of the Birds of Brazil; but it does not appear that any of them were ever seen in America, unless it were those which were transported thither by the vessels that trade between Asia and that continent. It is extremely improbable that a bird, so little capable of directing its flight amidst a gentle breeze, should ever have attempted so long a voyage. The bird of paradise is confined within very narrow limits in that continent which it inhabits, and never has shown a disposition to go beyond them: it is not to be supposed, therefore, that it should ever have attempted to cross the Pacific Ocean.

The Portuguese first discovered these birds in the island Vol. XVIII. No. 1253.

of Gilolo; and they were known by the name of *birds of the fin*. The inhabitants of Ternate called them *manuco dawata*, "the bird of God;" whence the name *manucodiata*, used by some naturalists, is derived. According to them, these birds have no legs; and the error is scarcely at this moment wholly eradicated, as we find the species still called *apoda*. The circumstance which gave rise to it did not indeed at first proceed from an intention to deceive, but merely from accident: in the parts of the world which produce these birds, the natives made use of them as aigrets and other ornaments of dress, and in course threw away the less brilliant parts; all the trouble they were at on this occasion was merely to skin the bird, and, after cutting off the legs, the coarser part of the wings, &c. to thrust a stick down the throat into the body, letting an inch or two hang out of the mouth beyond the bill: on the bird's drying, the skin collapsed about the stick, which became fixed, and supported the whole. They had then no more to do than to put this end of it into a gold or silver socket fitted to receive it, or fasten it in some manner to the turban, &c. By degrees these were imported into the other isles for the same uses, and afterwards were coveted by the Japanese, Chinese, and Persians, in whose countries they are frequently seen, as well as in many parts of India; the grandees of these last parts not only ornamenting themselves with these beautiful plumes, but adorning even their horses with the same. These birds are not found in Key, an island fifty Dutch miles east of Banda; but they are found at the Arou islands, lying fifteen Dutch miles farther east than Key, during the westerly or dry monsoon; and they return to New Guinea as soon as the easterly or wet monsoon sets in. They come always in a flock of thirty or forty; and during their flight they cry like starlings. Their note, however, approaches more to the croaking of ravens; which is heard very plainly when they are in distress from a fresh gale blowing on the back of their plumage. In Arou, these birds settle on the highest trees; and the natives catch them with birdlime or in nooses, or shoot them with blunt arrows; but, though some are still alive when they fall into their hands, the catchers kill them immediately, not knowing their food; then they draw out the entrails, dry and fumigate the bodies with sulphur, and sell them at Banda for half a rix-dollar each. Flocks of these birds are often seen flying from one island to the other against the wind. In case they find the wind become too powerful, they fly straight up into the air, till they come to a current where it is less agitated, and then continue their flight. During the eastern monsoon their tails are moulting, so that they have them only during four months of the western monsoon. The dried specimens indeed, which are brought to Europe, present great diversity of appearance; in size, in the number and position of the feathers, in the colours of the plumage, &c. But, in such mutilated and imperfect preparations, it is impossible to decide what must be ascribed to the effect of age, of sex, of season, of climate, and of other accidental causes. Besides, the birds of paradise being very expensive articles of commerce, many other birds, with long tails and an elegant plumage, have been passed on the credulity of the public, and the legs and thighs pulled off, to conceal the fraud and enhance the price. We have already had an example in the paradise roller, mentioned by Edwards, on which the honours of mutilation had been conferred, in order to make it pass for a bird of paradise. This beautiful species is represented on the annexed Engraving, at fig. 1.

2. *Paradisea regia*, the king bird of paradise: body chestnut, whitish beneath, breast bluish; the two middle tail-feathers filiform, feathered, and semilunar at the tips.

The name of king-bird, given to this species by the English writers, had its origin in those fables that were propagated by the sailors, who retailed the fictions they had learned from the superstitious Indians. One of these was,

5 M

that

that each species of the birds of paradise had its own king, to which every individual paid submission and obedience: that this king always flew in a higher region of the air than his subjects, from which he issued various orders to them; such as, to go and examine the springs where he might drink with safety, and to taste of them before him. This alleged king of the birds of paradise in many circumstances resembles the preceding; in more, perhaps, differs from it. His head is garnished with the same velvet covering; his eyes are equally small; and he has the two filous and naked feathers springing from the uropigium, and going greatly beyond the tail; and their extremity, which is furnished with webs, forms a curl, by rolling into itself, and is ornamented with spangles, somewhat like those of a peacock. He also has under the wing, on each side, a bunch of seven or eight feathers, which are longer than in most birds, but not so long as those of the greater bird of paradise, and of a different shape, for they are edged through their whole extent with webs of adhering filaments. The king-bird is smaller than the apoda; the wings are longer, the tail shorter. It is found on the islands of the Indian Ocean; and returns to New Guinea in the rainy season.

3. *Paradisea tristic*, the grakle bird of paradise: a triangular naked space behind the eyes; the head and neck brown. It is nine inches and a half long.

This bird has a great affinity in all its habits to the grakle genus; yet, on account of the downy feathers at the base of the bill, it is placed among the birds of paradise. It feeds upon insects, and the havoc which it makes is the more considerable, as it has a gluttonous appetite: the various sorts of flies and caterpillars are its prey. Like the carrion-crows and magpies, it hovers about the horses, the oxen, and the hogs, in search of the vermin which often torment these animals to such a degree as to exhaust them, and even occasion death. The patient quadrupeds are glad to get rid of these; and suffer, without molestation, often ten or twelve to perch on their back at once; but the intruders are not content with this indulgence; the skin need not be laid bare by a wound; the birds will peck with their bill into the raw flesh, and do more injury than the vermin which they extract. They may indeed be considered as carnivorous birds, whose prudence directs them to attack openly none but the weak and the feeble. A young one was known to seize a rat two inches long, exclusively of the tail, dash it repeatedly against the board of its cage, break the bones, and reduce every limb to a pliancy suited to its views; and then lay hold of it by the head, and almost in an instant swallow it entire. It rested about a quarter of an hour to digest, its wings drooping, and its air languid; but, after that interval, it ran with its usual cheerfulness; and about an hour afterwards, having found another rat, it swallowed that as it did the first, and with as little inconvenience. This bird is also very fond of grasshoppers; and, as it destroys immense quantities, it is a valuable guest in countries infested with these insects. It is found in India and the Philippines, and probably in the intermediate islands. These birds are not timorous, and are little disturbed by the report of a musket. They commonly take possession of certain trees, or even certain rows of trees, often very near hamlets, to pass the night. They alight in an evening in such immense bodies, that the branches are entirely covered with them, and the leaves concealed. When thus assembled, they all begin to chatter together, and their noisy society is exceedingly troublesome to their neighbours. Yet their natural song is pleasant, varied, and extensive. In the morning they disperse into the fields, either in small flocks, or in pairs, according to the season.

They have two hatches in succession every year, the first being in the middle of spring. Their nests are very rude, and they take no precaution to prevent the wet from penetrating. They fasten them in the leaves of the palm or other trees; and, when opportunity presents,

they prefer a hay-loft. These birds are warmly attached to their young: when their nests are about to be robbed, they flutter round, and utter a sort of croaking, which indicates their rage, and dart upon the plunderer: nor do their fruitless exertions extinguish their affection; they follow their brood, which, if set in a window or open place, the parents will carefully supply with food; nor will they in the least be deterred by anxiety for their own safety.

The young are quickly trained, and easily taught to talk. If kept in the poultry-yard, they spontaneously mimic the cries of all the domestic animals, hens, cocks, geese, dogs, sheep, &c. and their chattering is accompanied with certain accents and gestures which are very pleasing.

This bird is rather larger than a blackbird. The bill and legs are yellow as in these, but longer, and the tail shorter. The head and neck are blackish; behind the eye is a naked reddish skin, of a triangular shape; the lower part of the breast, and all the upper part of the body, including the coverts of the wings and of the tail, of a chestnut brown; the belly white; the twelve quills of the tail, and the middle quills of the wings, brown; the large ones blackish, from the tip to the middle, and thence to their origin white; which produces an oblong spot of that colour near the edge of each wing when it is closed; and in this situation the wings extend as far as two-thirds along the tail.

4. *Paradisea magnifica*, the magnificent bird of paradise: chestnut-brown above; chin green, with golden lunules; crown with a tuft of yellow feathers. It inhabits New Guinea, and is about nine inches long. It is a singularly-beautiful species. The first quill-feathers are brown, secondary deep yellow; middle tail-feathers very long, with a short fringe; legs and bill yellow, the latter black at the base and tip. The two tufts, which are regarded as the distinctive character of this bird, appear behind the neck, and at its origin. The first consists of several narrow feathers of a yellow colour, marked near the point with a small black spot, and which, instead of lying flat, in the usual manner, stand almost erect; those near the head at right angles, and the succeeding ones with smaller inclinations. Under the first tuft we perceive a second, which is larger, but not so much raised, and more reclined; it is composed of long detached filaments, which sprout from very short shafts, and of which fifteen or twenty join together, forming straw-coloured feathers. These feathers seem to be cut square at the end, and make angles, more or less acute, with the plane of the shoulders. This second tuft is bounded on the right and left by common feathers, variegated with brown and orange, and is terminated behind by a reddish and shining brown spot, of a triangular shape, with the vertex turned towards the tail, and the filaments of the feathers loose and decomposed, as is the second tuft.

Another characteristic feature of this bird is, the two filaments of the tail, which are about a foot long and a line broad, and of a blue colour, changing into a lucid green, and taking their origin above the tail. So far they much resemble the filaments of the preceding species, but are of a different form, for they do not end in a curl, and are furnished with webs on the middle only of the inner side. This is represented at fig. 2.

5. *Paradisea cirrata*, the crested bird of paradise: head, neck, and wings, black; tuft of hairs near the crown, and frontlet, yellow. Bill very long, black, hooked; tuft on the crown three inches high, rigid, appearing as if bristly: probably a variety of the preceding. Inhabits New Guinea; eighteen inches long.

6. *Paradisea nigra*, the gorget bird of paradise: black; beneath slight green; hind head, nape, crown, and band on the middle of the belly, fine green; under the chin a gold-coloured crescent. This elegant species is about the size of a blackbird in the body; which, from the tip of the bill to the insertion of the tail, measures no more than

than about six inches, the tail occupying all the rest. The bill is an inch in length, rather stout, moderately bent, and of a black colour: the forehead is furnished with tufted thick feathers, which occupy also the sides of the head; and beneath the eye, and round the throat, they are so full as to enlarge those parts considerably in bulk: the colour of this part of the plumage is black, and like plush or velvet; but from the root of the under mandible, at the chin, are a few feathers of the common structure, with webs: the back part of the head, nape, and hind part and sides of the neck, to the beginning of the back, are of a gilded green, but the feathers are not much unlike those in common, and which, in course, sitting closer to the skin, give those parts a flat appearance: at the angles of the mouth begins a line of the most brilliant gilded copper-colour imaginable, which passes beneath the eye, growing wider by degrees, and finishes in a kind of crescent or gorget, of half an inch or more in width, on the fore part of the neck; beneath this, to the vent, the colour is dull green, except on the middle of the belly, where there is a transverse bright-green band: the back is black, having both a copper and purple gloss, in different lights; wings deep black; beneath them the feathers are downy, but do not exceed at all in length, as in the other birds of paradise. The tail is of an enormous length, and consists of twelve feathers of unequal lengths, the two middle ones being near twenty-two inches long, and the outer one only five inches; the colour of all of them much the same as the hack of the bird. It inhabits the islands of the Indian Ocean. Extreme length, from the tip of the bill to the end of the tail, twenty-eight inches. It is represented, from Latham, at fig. 3.

7. *Paradisea leucoptra*, the white-winged bird of paradise: black; crown shining copper; quill-feathers white, edged with black on the outside; tail wedged. Length twenty-five inches; bill black, hardly curved; feathers on the chin long; tail very long, two middle feathers twenty, the rest seven, inches long.

8. *Paradisea superba*, the superb bird of paradise: slightly crested with gold-green; upper part of the throat violet, silky; wings black; under parts lively green. The predominant colour of the plumage of this bird is a rich velvet black, decorated under the neck with reflections of deep violet. Its head, breast, and the hind part of its neck, are brilliant, with the variable shades of a fine gold-green; the rest is entirely black, not even excepting the bill. It seems to want the filaments of the tail; but in other respects it resembles these birds, not only in its general shape, and in that of its bill, but is also related by the identity of climate, by the richness of its colours, and a certain superabundance of luxuriancy of feathers which is peculiar to the birds of paradise; for there are two small tufts of black feathers which cover the nostrils, and two other bunches of the same colour, but much longer, and directed to the opposite extremity. These rise on the shoulders, and spreading more or less over the back, but always bent backwards, form a sort of wings, which extend almost to the extremity of the true, when these are closed: these feathers are of unequal lengths, and those of the anterior surface of the neck and sides of the breast are very long and narrow. It inhabits New Guinea; and is about ten inches long.

9. *Paradisea furecata*, the furcated bird of paradise: black; under the wings a downy tuft; feathers in the middle of the belly like a forked tail, shining green. Described from an incomplete specimen in the late Leverian Museum.

10. *Paradisea aurea*, the golden bird of paradise. If we adopt the filaments as the generic character of the birds of paradise, the present is intitled to be ranged at their head; for, instead of two, it has six, and of these not one rises on the back, but all of them take their origin from the head, three on each side: they are half a foot long, and reflect backwards; they have no webs but

at their extremity for the space of six lines, and these are black and pretty long. Besides these filaments, this bird has two properties which belong to the bird of paradise; luxuriancy of feathers, and richness of colours.

The luxuriancy of feathers consists; 1. In a sort of tuft composed of stiff narrow feathers, and which rises at the base of the upper mandible. 2. In the length of the feathers of the belly and of the abdomen, which is four inches or more; one part of these feathers, extending directly, conceals the under-side of the tail, while another part, rising obliquely on each side, covers the upper surface of the tail as far as the third of its length; and all of them correspond to the subalar feathers of the greater bird of paradise.

With regard to the plumage, the most brilliant colours appear on the neck; behind, it is gold-green and bronze-violet; before, topaz-gold reflections, which wanton in all the shades of green, and derive new lustre from the contrast with the darkness of the contiguous parts; for the head is black, changing into a deep violet; and the rest of the body is brown, inclining to black, and with reflections of the same deep violet.

The bill of this bird is nearly the same as in the other birds of paradise; the only difference is, that its upper ridge is angular and sharp, while in most of the other kinds it is rounded. Nothing can be said with respect to the feet and legs, because they were extirpated in the subject from which this description is drawn; a practice which, as we have remarked, is usual with the Indian hunters or merchants. It inhabits New Guinea; and is about the size of a turtle-dove.

11. *Paradisea viridis*, the blue-green bird of paradise. If this bird has not the luxuriant plumage of the rest of the paradise tribe, it has at least the rich colours and the peculiar softness of texture. Its head is covered with a beautiful blue velvet, changing into green, and exhibiting the reflections of the beryl. The neck is clothed with a longer shag, but which dazzles with the same colours, except that, each feather being of a shining black in the middle, of a green changing into blue only at the edges, there result waving shades, which play still more than those of the head. The back, the rump, the tail, and the belly, are blue, like polished steel, and with very brilliant reflections. The small velvet feathers on the forehead project forward as far as the nostrils, which are deeper than in the preceding kinds. The bill is also longer and thicker; but it is of the same shape, and its edges are scalloped in the same manner near the point. It inhabits New Guinea, and is sixteen inches long.

12. *Paradisea alba*, the white bird of paradise. This is entirely white, and is the rarest of all the species. It is found in the Papuan islands.

β A variety, which is black on the fore-part, and white on the hind-part.

PARADIS'ACAL, *adj.* [from *paradise*.] Suited to paradise; making paradise.—The ancients express the situation of *paradisical* earth in reference to the sea. *Burnet's Th. of the Earth*.—Such a mediocrity of heat would be so far from exalting the earth to a more happy and *paradisical* state, that it would turn it to a barren wilderness. *Woodward's Nat. Hist.*—The summer is a kind of heaven, when we wander in a kind of *paradisical* scene, among groves and gardens; but at this season we are like our poor first parents, turned out of that agreeable though solitary life, and forced to look about for more people to help to bear our labours, to get into warmer houses, and hive together in cities. *Pope*.

PARADIS'IAN, or **PARADISE'AN**, *adj.* *Paradisical*. *Not now in use*.—Life's grapes, those *paradisical* clusters. *J. Hall's Poems*.—What the heathen poets recount of the happiness of the golden age, sprung from some tradition they received of the *paradisian* fare. *Evelyn*.

PAR'ADOS, *f.* in military affairs, an elevation of earth which is effected behind fortified places, to secure them from

from any sudden attack that may be made in reverse. *Parapet* and *parados* come from terms signifying, "in the front" or "in the rear" of any thing. *James's Mil. Dict.*

PAR'ADOX, *f.* [from the Gr. *παρά*, against, and *δόξα*, opinion.] A tenet or proposition seemingly absurd, because contrary to received opinion; but yet true in effect. —The Copernican system is a *paradox* to the common people; but the learned are all agreed as to its truth. *Chambers*. —'Tis an unnatural *paradox* in the doctrine of causes, that evil should proceed from goodness. *Holyday*.

You undergo too strict a *paradox*,
Striving to make an ugly deed look fair. *Shakespeare*.

PARADOX'AL, *adj.* Paradoxical. *Phillips*.

PARADOXI, or **PARADOXOL'OGI**, *f.* among the ancients were a kind of mimes, or buffoons, who diverted the people with their drolling. They were also called *ordinarii*, for this reason apparently, that, as they spoke without study or preparation, they were always ready. They had other denominations, as *niaticologi*, or tellers of children's tales; and *aretalogi*, of *ἀρετή*, virtue, because they talked much of their own rare talents and qualifications.

PARADOX'IAL, *adj.* Having the nature of a paradox; seemingly contradictory; inclined to new or unpopular opinions. *Ash*.

PARADOX'ICAL, *adj.* Having the nature of a paradox. —Strange it is, how the curiosity of men that have been active in the instruction of beasts, among those many *paradoxical* and unheard of imitations, should not attempt to make one speak. *Brown's Vulg. Errors*. —Included to new tenets, or notions contrary to received opinions.

PARADOX'ICALLY, *adv.* In a paradoxical manner; in a manner contrary to received opinions. —If their vanity of appearing singular puts them upon advancing paradoxes, and proving them as *paradoxically*, they are usually laughed at. *Collier on Pride*.

PARADOX'ICALNESS, *f.* State of being paradoxical.

PARADOXOL'OGY, *f.* The use of paradoxes. —Perpend the difficulty, which obscurity or unavoidable *paradoxology* must put upon the attempter. *Brown*.

PARADROME, *f.* [Greek.] A gallery or passage without any covering over head.

PARAGANA. See **PERGUNNA**.

PARAGAUDÆ, *f.* among the Romans, a sort of wreaths, either wholly of gold, or of silk adorned with gold, which were interwoven in garments, and not sewed to them. The garment was sometimes of one colour, in which was woven one paragauda; others were of two colours, and had two paragaudæ; and some had three colours, and three paragaudæ. They were worn both by men and women.

PARAGE, *f.* [*paragium*, Lat.] In law, an equality of blood or dignity; but more especially of land, in the partition of an inheritance between coheirs.

Parage is more properly used, in ancient customs, for an equality of condition among nobles, or persons holding nobly. Thus, when a fief is divided among brothers; in this case, the younger hold their part of the elder by *parage*; i.e. without any homage or service.

The Customary of Normandy defines tenure by *parage* to be, when, a noble fief being divided among daughters, the eldest does homage to the chief lord for all the rest, and the youngest hold their parts of the rest by *parage*, i.e. without any homage or fealty.

PARAGO'GE, *f.* [Greek.] A figure whereby a letter or syllable is added at the end of a word, without adding any thing to the sense of it; as *vast*, *vastly*. *Johnson*. —This is an unfortunate example or illustration, because the affix *ly* changes the adjective into an adverb. We find in Latin *mirari* for *mirari*, *dicier* for *dier*, &c. and this *er* is often added to passive deponent verbs in the infinitive, (from which the *er*, a very common ending of

French verbs, took its origin.) We have also *potestur* for *potest*, and others; but few true paralogical instances are to be found in modern languages. The old definition in the following distich is correct:

A *paragoge* adds unto the end,
Yet not the sense, but measure, to amend.

And in fact, the *er* above mentioned is never used but in poetry, to obtain a syllable where it is wanted. Plautus and Terence yield many examples; and we have some in Virgil, &c. *Gleanings in Etymology*, MS.

PARAGOG'IC, or **PARAGOGICAL**, *adj.* Belonging to the grammatical figure called *paragoge*.

PARAGOG'ICALLY, *adv.* In a paralogical manner.

PAR'AGON, *f.* [*paragon*, from *parage*, equality, old Fr. *paragone*, Ital.] This word crept from Italian into French, and we received it from the latter. It comes originally perhaps from two Greek words, *παρά* and *ἀγων*, above contest; a *paragon*, *παράγων*, being a thing incontestably excellent, a pattern, a model. —Tunis was never graced before with such a *paragon* to their queen. *Shakespeare's Tempest*.

An angel! or, if not,
An earthly *paragon*. *Shakespeare*.

Companion; fellow. —Alone he rode without his *paragon*. *Spenser*. —Emulation:

Bards tell of many women valorous,
Which have full many feats adventurous
Perform'd, in *paragone* of proudest men. *Spenser*.

A match for trial of excellence:
Minerva did the challenge not refuse;
But deign'd with her the *paragon* to make. *Spenser*.

Then did he set her by that snowy one,
Like the true faint beside the image set,
Of both their beauties to make *paragone*,
And trial, whether should the honour get. *Spenser*.

To PAR'AGON, *v. a.* To compare; to parallel; to mention in competition. —The picture of Pamela, in little form, he wore in a tablet, purposing to *paragon* the little one with Artessia's length, not doubting but even, in that little quantity, the excellency of that would shine through the weakness of the other. *Sidney*.

I'll give thee bloody teeth,
If thou with Cæsar *paragon* again
My man of men. *Shakespeare*.

To equal; to be equal to:
We will wear our mortal state with her,
Catharine our queen, before the primeest creature
That's *paragon'd* i' th' world. *Shakespeare's Hen. VIII*.

To PAR'AGON, *v. n.* To pretend equality or comparison. —He should convert his eyes to see the beauty of Dorothea, and he should see that few or none could for feature *paragon* with her. *Shelton's Don Quixote*.

PAR'AGON, one of the largest of the Calamianes Islands, in the Eastern Indian Sea.

PARAGONG'. See **PARO**.

PARAGOR'IC. See **PARAGORIC**.

PAR'AGRAM, *f.* [Greek.] A kind of play upon words. *Not now in use*. —Aristotle, in the eleventh chapter of his book of rhetoric, describes two or three kinds of puns, which he calls *paragrams*. *Addison's Spect.* N° 61.

PAR'AGRAPH, *f.* [from the Gr. *παρά*, through, and *γραφα*, to write.] A distinct part or division of a chapter or section, sometimes marked thus ¶. —Of his last *paragraph*, I have transcribed the most important parts. *Swift*.

To PAR'AGRAPH, *v. a.* To divide into paragraphs.

PARAGRAPHICAL, *adj.* Having distinct sections; disposed in proper paragraphs.

PARAGRAPH'ICALLY, *adv.* By paragraphs; with distinct breaks or divisions.

PARAGUA'RI,

PARAGUA'RI, a town of Brasil, on the river of the Amazons: 230 miles west of Fort Rio Negro. Lat. 3. 10. S. lon. 65. 56. W.

PARAGUA'Y, [q.d. Kingly Stream.] A river of South America, which rises about lon. 58. W. between the 5th and 6th degrees of S. latitude. Its course is almost due south, till it joins the Plata in lat. 28. S. lon. 60. 36. W.

PARAGUA'Y, a province of South America, in the viceroyalty of Buenos Ayres called the *Government of Paraguay*. Paraguay was first discovered by Sebastian Cabot, who, coming to the river Plata in the year 1526, sailed up the Parana in some small barks, and thence entered that of Paraguay. He was succeeded, in 1536, by Juan de Ayalas, to whom Don Pedro de Mendoza, the first governor of Buenos Ayres, had given a commission, together with a body of troops, military stores, and other necessities; and afterwards, by his orders, Juan de Salinas founded the city of Nuestra Senhora de la Assumption, the capital of the province. But the discovery of the whole, and consequently the conquest of the people who inhabited it, being still imperfect, it was prosecuted by Alvaro Nunez, surnamed *Cabeza de Baca*, or "Cow-head," whose eminent services, on the death of Mendoza, procured for him the government of Buenos Ayres. The only settlements, in the whole extent of this government, are the city of Assumption, Villa Rica, and some other towns inhabited by converted Indians, who were once entirely under the administration of the Jesuits. The province is distinguished by its fertility; and, though it produces none of the precious metals, it is the most opulent in the new viceroyalty, on account of its various vegetable productions, and the prodigious herds of horses, mules, cattle, and sheep, which enliven its extensive plains. The northern parts, however, of Paraguay have been little explored, as the settlements of the Jesuits were chiefly in the southern skirts, and among the adjacent Abipons and Guaranis.

It was in the year 1580 that the Jesuits were first admitted into these fertile regions, where they afterwards, in the reign of Philip III. founded the famous Missions, which in Europe have been known under the name of *Paraguay*, but in America *Uruguay*, from the river of that name on which they were situated. Actuated by motives of religion and of interest, they were diligent and zealous in the service assigned them of converting the Indians to the Catholic faith; and by a gradual progress their labours were attended with very considerable success. The Jesuit missionaries had previously stipulated with the court of Spain, that, for the more effectual accomplishment of their purposes in converting and civilizing the Indians, they should be independent of the governors of the province, and that they should annually receive from the royal treasure 60,000 piastres for defraying the expenses of cultivation; on condition that, as colonies were formed and the lands cultivated, the Indians should pay yearly a piastre per head to the king, from the age of eighteen to sixty. The Jesuits, thus encouraged, embarked in the execution of their enterprise with singular resolution and ardour; and, notwithstanding the difficulties with which they had to contend, succeeded in civilizing the barbarous Indians, introducing among them useful and polite arts, and forming them into a state of mutual affection and amity, of profitable labour and domestic comfort. Their missions extended over a country which contained about 200 leagues north and south, and about 150 east and west; and the number of inhabitants was about 300,000.

The country was divided into parishes, and each parish was under the direction of two Jesuits, who officiated, the one as rector, and the other as curate. The establishment was supported at an expense, which, comprehending the magnificent structure and ornaments of the churches, was not very considerable; as the Indians supported them-

selves by their own labour. The products of the ground and cattle belonged to the Jesuits, who provided instruments of various trades, for glaſs, knives, needles, chaplets of beads, gunpowder, and muskets. Their annual revenues consisted in cotton, tallow, leather, honey, and more especially *mate*, or herb of Paraguay, (see *ILEX vomitoria*.) monopolized by the society, and yielding, according to the statement of Dr. Robertson in his History of America, 100,000l. annually. The whole system of administration, planned and conducted by the Jesuits, was so formed as to keep the Indians in perfect subordination to the rectors; whilst they were provided with means of instruction in various departments of science, such as music, painting, sculpture, and architecture, and also of manufactures and trade; and at the same time their attention was directed to the regular performance of religious ceremonies and duties. See the article *JESUIT*, vol. x. p. 787, 8. and, for a more particular account of the management of the Jesuits in the government of this country, see the *Gentleman's Magazine* for Jan. 1753.

While the society of Jesuits were thus employed in extending its missions and establishing its authority, their designs and labours were suddenly terminated by the Spanish court, which, in 1767, decreed their expulsion throughout its widely-spread dominions. When their effects in this province were confiscated, it was expected that large sums of hoarded money would have been found; but these, in their whole amount, were very trifling. Their magazines indeed, were furnished with all sorts of merchandize, consisting of the products of the country, and of goods imported from Europe; the number of their slaves was also very considerable, inasmuch, that at Cordova alone they reckoned 3500.

PARAGUA'Y, or PALAWAN, the most westerly of the Philippine islands, about 180 miles in length, and 21 in breadth: 190 miles east-north-east of Mindanao. Lat. 8. 12. to 11. 31. N. lon. 117. 21. to 119. 40. E.

PARAGUR', a town of Hindoostan, in the circar of Gohud; in ruins: twenty-five miles south of Narwa.

PAR'AH, a town of Bengal: ten miles west of Rogonattpour. Lat. 23. 30. N. lon. 86. 39. E.

PAR'AH, *f.* A corn-measure in the East Indies. At Madras, the parah should measure 3750 cubic inches, and weigh 148lbs. avoirdupois of fresh spring-water. When grain is sold by weight, 115lbs. are reckoned for the parah.

PARAIBA, or PARA-IBA, a town of Brasil, and capital of a province or captaincy of the same name, which it derives from that of a river, on the south bank of which it is situated, about ten miles from the sea; the river being navigable above the town for ships loaded with 600 or 700 hogheads of sugar. The harbour is large, but rather dangerous on account of the sand-banks. The town has many stately houses, decorated with marble pillars, besides large warehouses and magazines for the accommodation of merchants; and the mouth of the river is defended by three forts. The Portuguese, who took possession of this town and territory in 1584, after having expelled the French, have increased its buildings, planted sugar-canes, and erected sugar-mills. The whole territory is fertile in sugar-canes; and abounds in Brasil-wood, cattle, tobacco, cotton, &c. It is sixty miles north of Pernambuco. Lat. 7. 15. S. lon. 34. 3. W.

PARAIBA DE SUL', a river of Brasil, which runs into the Atlantic in lat. 7. 15. S.—There is another river in the south, of the same appellation.

PAR'AKIN, a town of Servia: thirty-two miles north-north-west of Nissa, and sixty-eight east-south-east of Belgrade.

PARALAPUT'TY, a town of Hindoostan, in Mysore: ten miles from Sankeridugam.

PARALEP'SIS, *f.* [Greek.] An omission; the act of passing over.

PARALIAS, *f.* in botany. See *EUPHORBIA*.

PARALIPOM'ENA, *f.* [from the Gr. παραλειπω, I pass by.] A supplement of things omitted and forgotten

in some preceding work, or treatise. In the canon of Scripture, there are two books of Paralipomena, called in the English version Chronicles; being a supplement to the four books of Kings, the two first of which are also called books of Samuel.—Quintus Calabar has a work, entitled the *Paralipomena* of Homer. *Chambers*.

PARALIP'SIS, *f.* [Greek.] A figure in rhetoric in which we affect to pass over what nevertheless we particularly mention.

PARALLACTIC, or PARALLACTICAL, *adj.* [from *parallax*.] Relating to parallax.

PAR'ALLAX, *f.* [*παράλλαξις*, Gr.] An arc of the heavens intercepted between the true place of a star and its apparent place. The true place of a star is that point of the heavens in which it would be seen by an eye placed in the centre of the earth: the apparent place is that point of the heavens in which the star appears to an eye on the surface of the earth. See the article ASTRONOMY, vol. ii. p. 415, 16.—Light moves from the sun to us in about seven or eight minutes time, which distance is about 70,000,000 English miles, supposing the horizontal *parallax* of the sun to be about twelve seconds. *Newton's Optics*.

By what strange *parallax* or optic skill
Of vision multiply'd.

Milton's P. R.

PARALLAX, is also used to denote the change of place in any object arising from viewing it obliquely with respect to another object. Thus the minute-hand of a watch is said to have a parallax when it is viewed obliquely; and the difference between the instants shown by it, when viewed directly and obliquely, is the quantity of parallax in time.

PAR'ALLEL, *adj.* [from the Gr. *παρα*, by the side, and *αλλος*, another.] Extended in the same direction; always preserving the same distance.—Distorting the order and theory of causes perpendicular to their effects, he draws them aside unto things whereto they run *parallel*, and their proper motions would never meet together. *Brown's Vulg. Err.*—Having the same tendency.—When honour runs *parallel* with the laws of God and our country, it cannot be too much cherished; but, when the dictates of honour are contrary to those of religion and equity, they are the great depravations of human nature. *Addison*.—Continuing the resemblance through many particulars; equal; like.—The foundation-principle of peripateticism is exactly *parallel* to an acknowledged nothing. *Glanville*.—I shall observe something *parallel* to the wooing and wedding suit in the behaviour of persons of figure. *Addison*.—In the *parallel* place before quoted. *Leffie*.—Compare the words and phrases in one place of an author, with the same in other places of the same author, which are generally called *parallel* places. *Watts*.

PAR'ALLEL, *f.* Line continuing its course, and still remaining at the same distance from another line:

Who made the spider *parallels* design,
Sure as De Moivre, without rule or line?

Pope.

Direction conformable to that of another line:

Disensions, like small streams, are first begun;
Scarce seen they rise, but gather as they run;
So lines, that from their *parallel* decline,
More they proceed, the more they still disjoin.

Garth.

Resemblance; conformity continued through many particulars; likeness:

*Twixt earthly females and the moon
All *parallels* exactly run.

Swift's Miscell.

Comparison made.—A reader cannot be more rationally entertained, than by comparing and drawing a *parallel* between his own private character and that of other persons. *Addison*.—Any thing resembling another.—Thou ungrateful brute, if thou wouldst find thy *parallel*, go to hell, which is both the region and the emblem of ingratitude. *South's Sermons*.

For works like these, let deathless journals tell,
None but thyself can be thy *parallel*.

Pope.

PARALLELS, or *Parallel Circles*, in geography, called also *Parallels of Latitude*, are smaller circles of the sphere, conceived to be drawn from west to east through all the points of the meridian; commencing from the equator, to which they are parallel, and terminating with the poles. They are called parallels of latitude, because all places lying under the same parallel have the same latitude.

Parallels of Declination, in astronomy, are the same with parallels of latitude in geography.

PARALLEL SAILING. See the article NAVIGATION, vol. xvi. p. 624.

PARALLEL SPHERE, that situation of the sphere in which the equator coincides with the horizon, and the poles with the zenith and nadir. In this sphere, all the parallels of the equator become parallels of the horizon; consequently no stars ever rise or set, but all turn round in circles parallel to the horizon; and the sun, when in the equinoctial, wheels round the horizon the whole day. After his rising to the elevated pole, he never sets for six months; and, after his entering again on the other side of the line, he never rises for six months longer. This position of the sphere is their's who live under the poles, if any such there be; their sun being never above $23^{\circ} 30'$ high.

To PAR'ALLEL, *v. a.* To place, so as always to keep the same direction with another line.—The Azores having a middle situation between these continents and that vast tract of America, the needle seemeth equally distracted by both, and, diverting unto neither, doth *parallel* and place itself upon the true meridian. *Brown*.—To keep in the same direction; to level.—The loyal sufferers abroad became subjected to the worst effect of banishment, and even there expelled and driven from their flights; so *paralleling* in their exigencies the most immediate objects of that monster's fury. *Fell*.

His life is *parallel'd*

Ev'n with the stroke and line of his great justice. *Shakesp.*

To correspond to.—That he stretched out the north over the empty places, seems to *parallel* the expression of David, he stretched out the earth upon the waters. *Burnet*.—To be equal to; to resemble through many particulars.—In the fire, the destruction was so swift, sudden, vast, and miserable, as nothing can *parallel* in story. *Dryden*. To compare.—I *paralleled*, more than once, our idea of substance, with the Indian philosopher's he-knew-not-what, which supported the tortoise. *Locke*.

PARALLEL'ABLE, *adj.* That may be equalled.—Our duty is seconded with such an advantage, as is not *parallelable* in all the world beside. *Bp. Hall's Remains*.

PAR'ALLELESS, *adj.* Not to be paralleled; matchless:

Is she not *paralleless*? is not her breath
Sweet as Arabian winds when fruits are ripe?

Beaumont and Fletcher.

PAR'ALLELISM, *f.* The quality of a parallel, or that which denominates it such: or it is that whereby two things (e. g. lines, rays, or the like,) become equidistant from one another. State of being parallel.—Resemblance; comparison.—From a close *parallelism* of thought and incident, it is clear that either Browne's pastoral imitates Fletcher's play, or the play the pastoral. *Warton's Notes on Milton*.

PARALLELISM of the EARTH'S AXIS, in astronomy, is that invariable situation of the earth's axis, in its progress through its orbit, whereby it still looks nearly to the same point of the heavens, viz. towards the pole-star; so that, if a line be drawn parallel to its axis while in any one position, the axis, in all other positions or parts of the orbit, will always be nearly parallel to the same line. This parallelism is the necessary result of the earth's double

double motion; the one round the sun, the other round its own axis. It is to this parallelism that we owe the vicissitudes of seasons, and the inequality of day and night.—Speaking of the *parallelism* of the axis of the earth, I demand, whether it be better to have the axis of the earth steady and perpetually parallel to itself, or to have it carelessly tumble this way and that way? *Ray on the Creation.*

PAR'ALLELLY, *adv.* With parallelism.—The bony matter of the teeth consists of a number of layers which are disposed *parallelly* in respect to the pulp and to each other. *Scott's Outlines of Anatomy.*

PARALLELOGRAM, *f.* [from the Gr. *παράλληλος*, parallel, and *γραμμή*, a figure.] A quadrangular plain figure whose opposite sides are parallel and equal; an oblong.—We may have a clear idea of the area of a *parallelogram*, without knowing what relation it bears to the area of a triangle. *Watts's Logic.*

PARALLELOGRAM'MIC, or PARALLELOGRAMICAL, *adj.* Having the properties of a parallelogram.

PARALLELOPIPED *f.* [from *parallel*, and *πυς*, Gr. foot.] A solid figure contained under six parallelograms, the opposites of which are equal and parallel; or it is a prism, whose base is a parallelogram: it is always triple to a pyramid of the same base and height. *Harris.*—Two prisms, alike in shape, I tied so, that, their axes and opposite sides being parallel, they composed a *paralleloiped*. *Newton's Optics.*—Crystals that hold lead are yellowish, and of a cubic or *paralleloiped* figure. *Woodward.*

PARALLELOPIPED, *adj.* Belonging to a prism whose base is a parallelogram.

PARALLELOPLEURON, *f.* [from *parallel*, and *πλευρον*, a side.] A term used by some writers for an imperfect parallelogram, or a kind of trapezium, having unequal angles and sides, but which observe a certain regularity and proportion.

To PARALOGISE, *v. n.* [from *paralogy*.] To argue sophistically. *Scott.*

PARALOGISM, *f.* [from *paralogy*.] A false argument.—If a syllogism agree with the rules given for the construction of it, it is called a true argument; if it disagree with these rules, it is a *paralogism*, or false argument. *Watts.*

PARALOGY, *f.* [from the Gr. *παρα*, against, and *λογος*, reason.] False reasoning.—That Methuselah was the longest liver of all the posterity of Adam, we quietly believe; but that he must needs be so, is perhaps below *paralogy* to deny. *Brown.*

To PAR'ALYSE, *v. a.* [from *paralysis*.] To strike as it were with the palsy; to render useless. A modern word.

Or has taxation chill'd the aguish land,
And *paralys'd* Britannia's bounteous hand;
London Cries, or Pictures of Tumult, &c. 1805.

PARALYSIS, *f.* [Greek.] A palsy.

PARALYTIC, *f.* One struck by a palsy.—The *paralytic* was with much labour let down through the roof to our Saviour's cure. *Bp. Hall's Rem.*—If a nerve be cut or freightly bound, that goes to any muscle, that muscle shall immediately lose its motion; which is the case of *paralytics*. *Derham.*

PARALYTIC, or PARALYTICAL, *adj.* Palsied; inclined to palsy.—The difficulties of breathing and swallowing, without any tumour, after long diseases, proceed commonly from a resolution or *paralytical* disposition of the parts. *Arbuthnot.*

Nought shall it profit, that the charming fair,
Angelic, softest work of heaven, draws near
To the cold shaking *paralytic* hand,
Senseless of beauty.

Prior.

PARAMARIBOO', a town of South America, and capital of Surinam, situated on the west coast of the Surinam river, and about eighteen miles from the sea, with a good harbour. The number of houses is about 1400,

chiefly built of timber, and 5000 inhabitants. It contains two churches, and two Jewish synagogues. The streets are all perfectly straight, and lined with trees, such as oranges, lemons, shaddocks, and tamarinds. Lat. 5. 48. N. lon. 55. 11. W.

PARAM'BAH, a town of Hindoostan, in Bahar: seventeen miles east of Bahar.

PARAMECIUM, *f.* in helminthology, a genus of vermes of the order infusoria, or worms generated in infusions. Generic characters—Body very simple, pellucid, flat, oblong; invisible to the naked eye. There are eight species, five of which have been slightly noticed under the article ANIMALCULE, vol. i. p. 720.

1. *Paramecia aurelia*: compressed, longitudinally plaited towards the fore part, behind it is acute. This, says Mr. Adams, is rather a large animalculum, four times longer than broad; the fore part is obtuse, transparent, and apparently without intestines; the hind part is filled with molecules of various sizes. The fold that goes from the middle to the apex is a striking characteristic of the species, forming a kind of triangular aperture, and giving it somewhat the appearance of a gimblet. Its motion is rectilinear, reeling, or staggering, and generally vehement. This species is frequently found in ditch-water, and in infusions, cohering lengthwise; the lateral edges of both bodies appear bright. They may sometimes be seen lying on one another alternately, at others adhering by the middle. They will live many months in the same water, without its being renewed.

2. *Paramecium chrysalis*: has been described and figured under the article HELMINTHOLOGY, vol. ix. p. 362.

3. *Paramecium oviferum*: depressed, with large oval molecules within: the body is oval, pellucid, with black grains towards one end. This is represented, magnified, from Adams's Hist. of the Microscope, on the preceding engraving of PARADISEA, at fig. 4.

4. *Paramecium marginatum*: depressed, grey, with a double margin. It is one of the largest of the genus; flat, elliptical, and in every part filled with molecules, except at the lower end, where there is a pellucid vesicle. It is surrounded by a broad double margin; and, at the moment of its expiring, a bright spiral intestine is observable. See fig. 5 of the same plate.

5. *Paramecium caudatum*: pointed at both ends; the middle broader, and filled with molecules. It is found in waters among duck-weed; its motion is very slow.

6. *Paramecium anceps*: tail two-edged, head obtuse. The motion of this animalculum is very slow. It is found in the water in which the plant hydrocharis is produced.

7. *Paramecium acutum*: tail two-edged; head acute; inhabits stagnant water; is slow in its motions, but continually agitating its tail.

8. *Paramecium versutum*. This species, mentioned by Adams, but not by Gmelin, is cylindrical; the lower part thick, and both ends very obtuse. It has an oblong green gelatinous body, filled with molecules; the lower part is thick, the fore part is smaller, both ends are obtuse, and they may be seen to propagate by division. It is found in ditches.

PAR'AMENT, *f.* [French.] An ornament for an altar; robes of state. *Chaucer.*—A hunting term; the red flesh under the skin of a deer.—In masonry, a uniform course of stones.

PARA'MES, a town of New Jersey: fifteen miles north of Newark.

PARAMESE or PARAMESOS, *f.* in the ancient music, the ninth chord or sound in the scale. The word is Greek, and signifies "next to the middle;" its situation, in the first state of the scale, being next above the *meze*, or middle chord, which answers to *a-la-mi-re* of Guido's scale.

The same word is used by some to express the ring-finger, that next the middle.

PARAMESWA'RA, a name given to the Hindoo deity.

deity Siva. Hindoos of some sects give this name exclusively to Brahmā, the supreme ruler: others apply it to the deity whom they more particularly worship. In one of the Puranas, Lechemi is invoked under the name of Paramaishwarya-rupini, meaning "with the countenance of Parameshwara."

PARAMETER, *f.* A constant right line in each of the three conic sections; called also *latus rectum*.—In the parabola, the rectangle of the *parameter*, and an abscissa, is equal to the square of the correspondent semi-ordinate; in an ellipsis and hyperbola, the *parameter* is a third proportional to a conjugate, and transverse axis. *Chambers*.—See CONIC SECTIONS.

PARAMITHIA, a town of Greece, in Albania, with about 9000 inhabitants, according to Dr. Holland.

PARAMO (Luiz de), a native of Borox, in the diocese of Toledo, archdeacon and canon of Leon, and afterwards inquisitor in Sicily, is author of a most extraordinary work, entitled "De Origine et Progressu Officii Sanctæ Inquisitionis, ejusque Dignitate et Utilitate," which was undertaken under the patronage of D. Gaspar de Quiroga, then archbishop of Toledo, and inquisitor-general; and which was pronounced by Nicholas Antonio to be a work full of various learning. It was printed in folio at Madrid in 1598, and afterwards at Antwerp in 1614; and a copy of the first edition is in Dr. Williams's Library in Red-cross-street, London. Mr. Southey, in the General Biography, has given an analysis of this book, from whose account we shall give a few extracts, to show the inquisitor's mode of reasoning.

Paramo begins by proving God to have been the first inquisitor, who convicts Adam and Eve of heresy, infidelity, apostasy, and blasphemy. God cited Adam, otherwise the process would have been null. On Adam's appearance, he made *inquisition* into the crime. The man accused his wife, and then the judge questioned her: he did not examine the serpent, because of his obstinacy. The examinations were secret and separate, that there might be no collusive lying. He calls no witnesses; and affirms that conscience and confession are as a thousand witnesses, and save the judge all the trouble, except that of condemning. The whole, he says, was done secretly, that it might be a precedent for the holy office; and so closely does this holy office observe the precedent, that they make the dress of penitent offenders after the very pattern of the clothes which God made for Adam and Eve, and confiscate all the property of a heretic, because Adam and Eve were turned out of paradise. The author then goes on to show that Abraham was an inquisitor; so were David and Solomon. Zimri, who slew his master, was of the holy office; so was Elijah. Elisha and Jehu also are among the heroes of persecution; and Nebuchadnezzar most unexpectedly proves to be an inquisitor also. Under the Gospel, Christ was the first inquisitor: for the lice who devoured Herod, and the rulers who spoiled the Jews, only executed the sentences of death and confiscation which he had pronounced. James and John thought the Samaritans should be destroyed by fire: "here," says Paramo, "is the natural and ordained punishment of heretics! fire! the Samaritans were the heretics of those days, and all the apostles were lawful inquisitors!"

Such is his theory: let us now pass on to the practice; and here Paramo must be admitted to be an unexceptionable authority. He was an inquisitor himself; he wrote under the auspices of the inquisitor-general; and his book, with all the passports of the inquisition affixed to it, was printed at Madrid. The great work of desolation began at Guadaloupe in 1485. One heretical monk, and fifty-two Judaizers, as they are called, of both sexes, were then burnt alive, with the bodies of six-and-forty dug from their graves, and the effigies of twenty-five, who had happily effected their escape. How many were doomed to lighter punishment is not stated; they are said to have been innumerable. The lightest of them

was to wear a dress which was a warning to all Catholics to shun them; to be, both they and *their posterity for ever*, excluded from all offices of trust and honour, and prohibited from all ornaments and even neatness of dress, on pain of death. This was the lightest punishment. All professed Jews were ordered to leave the kingdom within a month: at the expiration of that time strict search was made, and about two thousand burnt in different parts of the country, to diffuse terror. As the inquisitors were exercising this office under the immediate eye of their great goddess of Guadaloupe, they were very desirous that she should testify her approbation by a miracle. Dr. Francisco Sancho de la Fuente, one of the three presidents, recorded sixty which were vouchsafed upon this occasion, and then desisted from the vain attempt at keeping pace with them. By the year 1520, above four thousand persons had been burnt alive in the diocese of Seville, and above thirty thousand deplored of all that they had, and condemned to perpetual infamy, they and their children after them, from generation to generation, for ever and ever! The whole number of persons in that diocese executed, made infamous, and driven into exile, exceeded 100,000; and in the city of Seville three thousand houses were left desolate.

A third of the confiscated property went to the royal treasury, a third to the extraordinary expenses of the faith (among which it is to be presumed fuel was included), and a third to the inquisition. "Instigated by the devil, there were some," he says, "who remonstrated with Hernando, and more particularly with Isabel, upon the ruin and desolation which they were bringing upon their kingdom; Isabel replied, that the destruction of heresy was more important than all other considerations." Appeals were made to the avarice of these worthy colleagues in catholicism and empire, and large sums offered for toleration or individual immunity. Torquemada, the grand inquisitor, was fearful how this might influence them; he entered the palace, and, taking a crucifix from under his habit, exclaimed, "Behold the image of our crucified Redeemer, whom Judas sold to his enemies for thirty pieces of silver: if ye approve that bargain, sell him now for a higher price; I abdicate my office! this shall not be imputed to me! you shall render the account of your bargain to God!"

Paramo himself was one of the most savage practical inquisitors that ever existed. He says, that in the course of a hundred and fifty years, the inquisition had burnt 30,000 witches: and he claims great part of the merit for himself, saying he had punished very many of them.

PARAMO'RES, a small island in the Atlantic, near the coast of Virginia. Lat. 37. 36. N. lon. 75. 44. W.

PARAMONDRA. See PYROMACHUS.

PAR'AMOUNT, *adj.* [*par* and *monter*, Fr.] Superior; having the highest jurisdiction: as, lord *paramount*, the chief of the feignory: with *to*.—Leagues within the state are ever pernicious to monarchies; for they raise an obligation, *paramount* to obligation of sovereignty, and make the king, *tanquam unus ex nobis*. *Bacon*.—The dogmatist's opinioned assurance is *paramount* to argument. *Glanville*.—Mankind, seeing the apostles possessed of a power plainly *paramount* to the powers of all the known beings, whether angels or demons, could not question their being inspired by God. *West on the Resurrection*.—Eminent; of the highest order.—John-a-Chamber was hanged upon a gibbet raised a stage higher in the midst of a square gallows, as a traitor *paramount*; and a number of his chief accomplices were hanged upon the lower story round him. *Bacon*.

PAR'AMOUNT, *f.* The chief:

In order came the grand infernal peers;
Midst came their mighty *paramount*.

Milton.

PARAMOUNT, in our law, signifies "the supreme lord of the fee, of lands, tenements, and hereditaments." There may be a tenant to a lord who holdeth himself of

of another lord; in respect whereof the former lord is called *lord mesne*, and the latter *lord paramount*. All honours, which have manors under them, have the lord paramount. But even the term lord paramount is only comparative; for, as one may be great, compared to a less; and little, being compared with a greater; so none truly seems to be lord paramount but the king, who is patron paramount to all the benefices in England.

PARAMOUR, *f.* [*par* and *amour*, Fr. "*Par amour*, I loved her." Chaucer, C. T. ver. 1157. This is an old expression. See Froissart, c. 196. "*Il aime adonc par amours*, et depuis espousa, madame Yfabelle de Juilliers." And Boccace, Decam. x. 7. *Per amore amiate*. From hence *paramour*, or *paramours*, in one word, was used vulgarly to signify love. *Thyrcyhit*.—These are the quotations of Mr. Todd in his edition of Johnson's Dictionary. But our Etymological Gleaner remarks, that the expression in Chaucer, although it appears very pretty, is by no means correct French. "*Je l'aimai par amour*," without any adjective, would have been pleonastic; but "*Je l'aimai d'amour pur, de pur amour*," would have been good French. Let us then suppose that *par amour* may have been corrupted into *paramour*; or (as the words are not explained at the head of the article) that *paramour* may signify, "my equal in love;" *par-in-amore*, Ital.] A lover or wooer.—She doted upon their *paramours*. *Ezek.* xxiii. 20.

A lovely bevy of fair ladies sat,
Courtied of many a jolly *paramour*.

Spenser.

A mistress:

Shall I believe

That unsubstantial death is amorous,
And that the lean abhorred monster keeps
Thee here in dark to be his *paramour*?

Shakespeare.

A rival:

And ever, when he came in companie
Where Calidore was present, he would loure
And byte his lip, and even for jealousy
Was readie oft his owne hart to devoure,
Impatient of any *paramoure*.

Spenser.

PARAMOUSI'R, or POROMASHIR, the second of the Kurile or Kurilskoi islands; between which and Shoontshu the strait is but two versts broad. It extends from north-east to south-west, and is twice as large as Shoontshu, and, according to Capt. Cook, is the largest of the Kuriles under the dominion of Russia. The land is very high; and, when visited by Cook's navigators, in his Third Voyage, Oct. 13, 1779, it was entirely covered with snow. It is richly furnished with roots and minerals, but destitute of wood. Here is no scarcity of red foxes, wolves, and all kind of mice. Mr. King places the south end of this island in lat. 49. 58. N. and the north end in lat. 50. 46. lon. 156. 14. E.

PARAMUT'TY, a town of Hindoostan, in the Carnatic: ten miles south-west of Coveriporum.

PARAN, [Heb. beauty.] A tract in Arabia the Stony, between the south of Canaan and the eastern gulf of the Red Sea; or rather it extended, when taken at large, as far as Sinai. *Deut.* xxxiii. 2. *Hab.* iii. 3. It is said, that part of it next Sinai abounded with bushes; but in the main, it was, and still is, a frightful desert. As for the houses, they were generally holes dug in the earth; but there was a city called Paran in it, whence Hadad took his guides to conduct him to Egypt. *1 Kings*, xi. 18. Dr. Shaw thinks its extent from Kadesh-barnea on the north, to Sinai, was about 110 miles; but it seems to have extended to the north-east of Kadesh, as David lurked in it when he was near Maon and south Carmel, (*1 Sam.* xxv. 2.) and perhaps it was the inhabitants of this part of it that Chedorlaomer ravaged before he attacked the Sodomites, (*Gen.* xiv. 6.) In the wilderness of Paran, probably to the south-west of Beer-sheba, Ishmael and his mother Hagar took up their residence, (*Gen.* xxi. 21.)

Vol. XVIII. No. 1253.

and hence the Ishmaelites dispersed themselves into the regions about. There seems to have been another place called *Paran* on the east of Jordan. *Deut.* i. 1.

PARA'NA, a town on the west coast of the island of Samar. Lat. 11. 54. N. lon. 124. 48. W.

PARA'NA, a town of Brasil, on the coast of the island of Marajo. Lat. 6. 12. S. lon. 51. 36. W.

PARA'NA, the longest and most considerable stream of the Rio de la Plata, which rises in the grand mineral mountains of Brasil, in 19° south lat. and bending south then west till it receives the Iba Parana, after which it bends south-west till it is joined by the Paraguay; while the conjunct rivers are still called *Parana* by the natives, and *Rio de la Plata* by the Spaniards. Yet the length of the Paraguay, according to the map of La Crux, does not yield above half a degree to that of the Parana; and the straightness of its course gives it the appearance of the principal river. The grand cataract of the Parana is in lat. 24°, not far from the ruined town of Cuayra; but is rather a series of rapids, for a space of 12 leagues, amidst rocks of tremendous and singular forms. Dobrizhoffer asserts that the Parana is the chief stream, which receives the Paraguay and Uruguay. The inundations are chiefly in December and January, rising about five or six yards above the islets. This noble river is studded with numerous islands; and Spanish vessels navigate to the town of Assumption, about 400 leagues from the sea. On the shores are often found goods, inclosing crystals; but the natural history of the Parana is almost as obscure as that of the true Maranon. The breadth of the estuary is such, that the land cannot be discovered from a ship in the middle of the stream. *Pinkerton*.

PARANAGUA, a river of Brasil, which runs into the Atlantic in lat. 25. 30. S.

PARANAMERIN, a river of Brasil, which runs into the Atlantic in lat. 2. 50. S. lon. 42. 46. W.

PARANAPANE'MA, a river of Paraguay, which runs into the Parana.

PARANETE, *f.* in the ancient music, was a name sometimes used to signify the next note or chord to the *nete*, or last note of a tetrachord. Hence it might be called the penultimate chord. It was otherwise, and more properly, called the *lichanos*, or index.

PARANOMASIA, *f.* A figure that occurs when two words, very near in sound, but different in sense, respect each other in the same sentence. This is usually called a pun.

PARANOO', a river of Malacca, which runs into the sea in lat. 4. 40. N. lon. 103. 25. E.

PARAN'TES, a town of France, in the department of the Landes: thirty-three miles north of Tartas.

PAR'ANYMPH, *f.* [Greek.] Among the ancients, the person who waited on the bridegroom, and directed the nuptial solemnities; called also *promubus*, and *auspex*, because the ceremony began with taking auspices.—As the *paranymp* only officiated on the bridegroom; on the part of the bride a woman officiated, who was called *promuba*. The Jews had likewise a kind of *paranymp*s, which the Talmud and rabbins call *חַבְדִּים*, *shushchebim*, q. d. "companions of the spouse." *Chambers*.—Contrary to the above, and other authorities of great respectability, Dr. Johnson defines *paranymp*, a bridegroom; one who leads the bride to her marriage:

The Timnian bride

Had not so soon preferr'd

Thy *paranymp*, worthless to thee compar'd,

Successor in thy bed.

Milton's S. A.

One who countenances or supports another.—Sin hath got a *paranymp* and a solicitor, a warrant and an advocate. *Bp. Taylor's Worthy Communicant*.

PAR'APEGM, *f.* [from the Gr. *παρεα*, with, and *πηνυμι*, to prove.] A brazen table fixed to a pillar, on which laws and proclamations were anciently engraved. Also a table set up publicly, containing an

account of the rising and setting of the stars, eclipses of the sun and moon, the seasons of the year, &c. whence astrologers give this name to the tables on which they draw figures according to their art. *Phillips*.—Our forefathers, observing the course of the sun, and marking certain mutations to happen in his progress through the zodiac, set them down in their *paraepems*, or astronomical canons. *Brown's Vul. Err.*

PARAPEG'MATA, *f.* The tables on which the astrologers draw their figures.

PAR'APET, *f.* [from the Ital. *parare*, to guard, and *petto*, the breast.] A wall breast-high. See **FORTIFICATION**.—There was a wall or *parapet* of teeth set in our mouth to restrain the petulance of our words. *B. Jonson*.

PAR'APH, *f.* A particular character, knot, or flourish, which people habituate themselves to make always in the same manner at the end of their name, to prevent their signature from being counterfeited.—The *paraph* of the kings of France used to be a grate, which the secretaries always place before their own, in all letters, &c. *Chambers*.

PARAPHERNALIA, *f.* [from the Gr. *παρά*, besides, and *φερν*, dower.] Goods which a wife brings her husband besides her dower, and which are still to remain at her disposal exclusive of her husband, unless there is some provision made to the contrary in the marriage-contract. Some of our English civilians define the paraphernalia to be such goods as a wife challengeth over and above her dower or jointure, after the husband's death; as furniture for her chamber, wearing-apparel, and jewels, which are not to be put into the inventory of her husband's goods. A French civilian calls paraphernalia the moveables, linen, and other female necessities, which are adjudged to a wife in prejudice of the creditors, when she renounces the succession of her husband.—In one particular instance the wife may acquire a property in some of her husband's goods, which shall remain to her after his death, and shall not go to his executors. These are called her *paraphernalia*; which is a term borrowed from the civil law, and is derived from the Greek language, signifying something over and above her dower. Our law uses it to signify the apparel and ornaments of the wife, suitable to her rank and degree: the jewels of a peeress, usually worn by her, have been held to be *paraphernalia*. *Blackstone*.

PARAPHIMO'SIS, *f.* [from the Gr. *παρά*, back, and *φίμω*, to bridle.] A disorder of the penis, in which the prepuce is drawn backward, behind the glans, and cannot be brought forward again. The complaint is the very reverse of *phymosis*, which is attended with a contraction of the opening of the prepuce, so that the glans cannot be uncovered. Both these diseases are mostly the consequence of an inflammatory thickening of the prepuce, arising from the irritation of gonorrhœa, a chancre, or simple excoriations.—*Paraphimosis* very frequently follows *phymosis*, by the thickened prepuce being very improperly drawn back behind the glans. *Chambers*.—See the article **SURGERY**.

PARAPHO'NIA, *f.* [from the Gr. *παρά*, and *φωνή*, the voice.] A depraved sound of the voice in speaking. See **PATHOLOGY**.

PARAPHONIA, in music, is that species of concord which results from different sounds, as the fifth and fourth: and thus it differs from *homophonia*, which is produced by the same sounds, as in the unison; and from *antiphonia*, or the replication of the same sounds, as in the octave.

PARAPH'ORA, *f.* A word used by the ancients to express a slight kind of delirium, or light-headedness, in a fever: some have made it to signify a delirium in general.

PAR'APHRASE, *f.* [from the Gr. *παρά*, with, and *φρασ*, a speech.] A loose interpretation; an explanation in many words.—In *paraphrase*, or translation with latitude, the author's words are not so strictly followed as his sense, and that too amplified, but not altered: such is Mr. Waller's translation of Virgil's fourth *Æneid*. *Dryden*.—Colomesius looks on Erasmus's *Paraphrase* on the New Testament as so extraordinary a work, that he makes no

scruple to declare, he thinks the author to have been divinely inspired when he penned it. *Chambers*.

PARAPHRASE, Chaldee. See **TARGUM**.

To PAR'APHRASE, *v. a.* To interpret with laxity of expression; to translate loosely; to explain in many words.—I could find in my heart, nay I can scarce hold from reading and *paraphrasing* the whole chapter to you: but for brevity's sake, and on promise that you will at your leisure survey it, I will omit to insist on it. *Hammond*.—We are put to construe and *paraphrase* our own words, to free ourselves from the ignorance and malice of our adversaries. *Stillington*.

To PAR'APHRASE, *v. n.* To make a paraphrase.—Where translation is impracticable, they may *paraphrase*.—But it is intolerable, that, under pretence of *paraphrasing* and translating, a way should be suffered of treating authors to a manifest disadvantage. *Felton on the Classics*.

What needs he *paraphrase* on what we mean?

We were at worst but wanton; he's obscene. *Dryden*.

PAR'APHRAST, *f.* A lax interpreter; one who explains in many words.—The fittest for public audience are such as, following a middle course between the rigor of literal translators and the liberty of *paraphrasts*, do, with great shortness and plainness, deliver the meaning. *Hooker*.

PARAPHRASTIC, or **PARAPHRASTICAL**, *adj.* Lax in interpretation; not literal; not verbal.—It is the genius, nay, the very essence, of oriental poetry, to be so very *paraphrastic* in itself, as not to admit of further dilatation in any modern version. *Mason on Ch. Music*.

PARAPHRASTICALLY, *adv.* In a paraphrastic manner.—Touching translations, it is to be observed, that every language hath certain idioms, proverbs, and peculiar expressions, of its own, which are not rendible in any other, but *paraphrastically*. *Howell*.—Chapman, in his translation of Homer, professes to have done it somewhat *paraphrastically*, and that on set purpose. *Dryden*.

PARAPHRENI'TIS, or **PARAPHRENSIS**, *f.* [not derived, it would appear, from *φρη*, the mind, and therefore synonymous with *phrenitis*, or phrensy; but from *φρεν*, præcordia; and it is therefore synonymous with **DIAPHRAGMITIS**.] An inflammation of the diaphragm. The symptoms are a violent fever, a most exquisite pain increased upon *inspiration*, by which it is distinguished from a pleurisy, in which the greatest pain is in *expiration*. *Arbuthnot*.

PARAPHROS'YNE, *f.* in the writings of some physicians, a slight and transitory derangement of the intellect, or non-febrile delirium, especially the temporary delirium occasioned by intoxicating and narcotic substances, such as spirituous liquors, opium, stramonium, hyoscyamus, hemp or bang, nightshade, hemlock, the betel-leaf, &c.

PARAPI'TI. See **MADEIRA RIVER**.

PARAPLE'GIA, or **PARAPLEX'IA**, *f.* [from the Gr. *παρά*, through, and *πλησσω*, I strike.] A palsy affecting the whole body below the neck. See **PALSY**, p. 302.

PARAQUI'TO, *f.* A little parrot:

Come, come, you *paraquito*, answer me

Directly to this question that I ask. *Shakespeare*.

PARARYTH'MUS, *f.* [from the Gr. *παρά*, besides, and *ρυθμός*, a number.] A pulse not suitable to the age of a person.

PAR'ASANG, or **FARSANG**, *f.* [*parasang*, low Lat. *parafange*, Fr. *παράσαγγης*, Gr.] A Persian measure of length.—Since the mind is not able to frame an idea of any space without parts, instead thereof it makes use of the common measures, which, by familiar use, in each country, have imprinted themselves on the memory; as inches and feet, or cubits and *parasangs*. *Locke*.—To see so much difference betwixt words and deeds, so many *parasangs* betwixt tongue and heart! *Burton's Anatomy of Melancholy*.

This measure has been different at different times, and in

in different places; being usually thirty, sometimes forty, and sometimes sixty, stadia or furlongs. Cafaubon cites a fragment of the architect Julian, who says, that the most common measure of the parasang, in his time; was forty stadia; and, reckoning each stadium at 125 geometrical paces, they would hereby avoid fractions in the computation of distances; 40 stadia, of 125 paces each, making 5000 Roman paces.

The parasang, at a mean, (says major Rennell,) was little short of $3\frac{1}{2}$ British miles. The parasanga of Xenophon was no more than 3 Roman miles, or 2.78 British. Herodotus and Xenophon say, that the parasanga consisted of 30 stadia; and, as these may be supposed to have been of the Grecian itinerary standard, the parasanga would be equal to 2.9 British miles, or $\frac{3}{4}$ only longer than that of Anabasis. *Renuell's Illustration of the Expedition of Cyrus.*

PARASAO'LI, a town of Hindoostan, in the circar of Jyenagur: fifteen miles north-north-east of Jyepour, and eighty-five west of Agra. Lat. 27. 10. N. lon. 76. 48. E.

PARASCE'NIUM, *f.* [from the Gr. *παρα*, beyond, and *σκηνη*, a scene.] The back part of the stage in the Grecian and Roman theatres, whither the actors withdrew to drefs and undrefs. The Romans more frequently called it *postscenium*.

PARASCE'VE, [Greek.] The sixth day of the last week of Lent, popularly called Good Friday. St. John says, our Saviour was crucified on the parasceve of the Passover, i.e. on the eve or day of preparation of the Passover: for Isidore and Papias observe, that the word in the original Greek signifies *preparation*, and was applied among the Jews to Friday, because on that day they used to prepare what was necessary for the celebration of the Sabbath. Exod. xv. 23. xxxv. 2, 3. Hence, what our translation of the New Testament renders "preparation of the sabbath," M. Simon and some others call *parasceve*.—It was the *preparation*; that is, the day before the sabbath. *Mark* xv. 42.—It was the *parasceve*, which is, the sabbath-eve. *Ibid.* *Rhemish Translation*.—And hence the word is used to signify any solemn preparation.—Why rather, being entering into that presence, where I shall wake continually and never sleep more, do I not interpret my continual waking here to be a *parasceve* and a preparation to that. *Domne's Devot.* 1624.

PARASCEUAS'TIC, *adj.* Preparatory.—Touching the Latin and Greek, and those other learned languages, they are the *parasceuashtick* part of learning. *Corah's Doom*, 1672.

PAR'ASCHE, *f.* [from *פָּרַשׁ*, Heb. to divide.] A name which the Jews give to that portion of the Pentateuch which they read every sabbath. They divide their five books of the Law, not into chapters, as we do, but into fifty-four parts, which they call *parasche*; and thus go through the whole in a year. To these they have added some verses of the Prophets, which they made use of under the persecution of Antiochus Epiphanes, when they were prohibited the use of the Law.

PARASCHY'DES, *f.* A word used by chirurgical writers to express the splinters of fractured bones, or the fragments of bones corroded by sharp humours.

PARASE'LENE, *f.* [from the Gr. *παρα*, near, and *σεληνη*, moon.] A mock-moon; a meteor encompassing or adjacent to the moon, in form of a luminous ring; in which are sometimes observed one, sometimes two, apparent images of the moon.—The *paraselenes* are formed after the same manner as the *parhelias*, or mock-suns, by reflections of the moon from zones of dense vapours that happen to be collected in the sky. *Chambers*.

PARASE'MON, *f.* [Greek.] Among the ancients, a sign painted or carved on the prow of ships, by which they were distinguished from one another. The sign was commonly the figure or picture of some animal, as the bull, lion, &c. or of any other thing, as a mountain, tree, flower, &c.

PAR'ASITE, *f.* [Fr. from *parasitus*, Lat.] One that

frequents rich tables, and earns his welcome by flattery. —Diogenes, when mice came about him as he was eating, said, I see that even Diogenes nourisheth *parasites*. *Bacon*.

Most smiling, smooth, detested, *parasites*,
Courteous destroyers, affable wolves, meek bears. *Shakefp.*

PARASITE, among the Greeks, was originally a very reputable title; the parasites being a kind of priests, at least ministers of the gods, in the same manner as the *epulones* were at Rome. They took care of the sacred corn, or the corn destined for the service of the temples and the gods, viz. sacrifices, feasts, &c. hence their name, from *παρα*, near, and *σιτος*, corn. They had even the intendance over sacrifices; and took care that they were duly performed. At Athens there was a kind of college of twelve parasites; each people of Attica furnishing one, who was always chosen out of the best families. Polybius adds, that a parasite was also an honourable title among the ancient Gauls, and was given to their poets.

PARASITE'UM, *f.* Among the ancients, a granary or place where the sacred corn, destined for religious purposes, was preserved. See PARASITE.

PARASIT'IC, or PARASITICAL, *adj.* Flattering; wheedling.—Some *parasitick* preachers have dared to call those martyrs, who died fighting against me. *King Charles*.—Applied to plants, which live on others, being produced upon the trunks, branches, or roots, of other plants; and which, in some instances, will not take their growth in the ground; as in the cases of mistletoe, various mosses, and the fungus tribe in general, but not always.—Ivy is a *parasitic* plant. *Miller*.

PARASIT'ICALLY, *adv.* In a flattering manner.—The courtiers also, to applaud the fact, *parasitically* made him their common mark. *Sir T. Herbert's Trav.*

PARASIT'ICALNESS, *f.* The state or quality of being parasitical. *Scott*.

PAR'ASITISM, *f.* The behaviour of a parasite.—Their high notion, we rather believe, falls as low as court *parasitism*; supposing all men to be servants but the king. *Milton's Obs. on the Articles of Peace*.

PARA'SO, a town of France, in the department of Golo, (or Isle of Corfica,) and chief place of a canton, in the district of Calvi. The canton contains 2471 inhabitants.

PARASO'L, *f.* [French.] A small canopy or umbrella carried over the head, to shelter from rain and the heat of the sun. *Dr. Johnson*.—Mr. Mason, after his manner, sneers at Dr. Johnson for confounding the *parasol* with the *umbrella*; informing us, that umbrellas against rain are of different materials and size from mere parasols, the use of which (according to their name) is only against the sun. This is true enough of the little female ornament of modern times; but Mr. Mason knew nothing of the old *parasol*, (for he also could find no instance of the word,) which was called an *umbrella*, and was of a reasonable *umbrella* size, we may judge from the following example; though certainly its use may have been intended to guard against the sun. *Todd*.—While the world is all on fire around them, they journey through that torrid zone, with their mighty *parasol*, or umbrella, over their heads, and are all the while in the shade. *Abp. Sancreft's Sermons*.—*Parasol* is from the French *parer*, to guard against, and *sol*, *soleil*, the sun. The opposite is *parapluie*, a shelter against rain; though the latter word is not yet received among us, since our *parapluie* is called an *umbrella*, or little shade. *MS. Gleanings in Etymology*.

PARASO'LE (Leonardo,) whose proper name was NORSINI, but who assumed that of Parasole, from its being the family-name of his wife, was born at Rome in the year 1570, and died in the same city at the age of sixty. He was an engraver on wood of some merit, and was much employed by A. Tempesta. At the command of pope Sixtus V. he engraved the plants, &c. for the Herbal of Caistor Durante, the physician of that pontiff.

The

The figures in Norfani's engravings, after Tempesta, are correctly drawn, and executed in a finished style, for that mode of art.

Isabella Parafole, the wife of Leonardo, was a woman of great ingenuity; and composed a book of patterns for lace and embroidery, the prints of which she engraved on wood. She likewise did a great number of plants for a Herbal of Prince Cesi, of Aquasparta.

Bernardo Norfani, their son, likewise engraved on wood; he had also begun to make some progress in painting, when he died at an early age.

Jermunica Parafole, a lady of the same family, equally distinguished herself by engraving on wood; and there is by her hand a large print of the Battle of the Centaurs, from Tempesta; it is coarsely executed, though with much spirit.

PARASOPIAS, in ancient geography, a country of Greece, in Thessaly, between Asophus and Sparchius, and above Heraclea. *Strabo*.

PARASTATA, *f.* in ancient architecture, a kind of pier, or piedroit, serving as a defence of support to a column or arch. Evelyn makes the parastata the same with pilaster; Barbaro, and others, the same with anta; and Daviler, the same with piedroit.

PARASTATA, in anatomy. See that article.

PARASU RAMA, in Hindoo mythology, is one of the ten grand incarnations of their deity Vishnu. On this occasion he was born the son of a pious Brahman named Jamadagni, and his wife Runega. This avatara, or incarnation, is said to have taken place in Agra, for the purpose of relieving mankind from a military government which had become insupportably oppressive. Parasu Rama fought twenty battles with one of the oppressive rajas, slew him, and extirpated the race. After a life spent in mighty and holy deeds, Rama gave his whole property in alms, and retired to the Kokan, or Concan, the low country between Surat and the Southern Cape, though not the whole extent of this tract, where the Hindoos say he is still living. In pictures, this Rama (for there are three of this name whose exploits form the subject of the Ramayana) is usually represented two-armed, holding a battle axe and a lotus, combating his twenty-armed foe Raja Diruj. The epithet *parasu*, distinguishingly prefixed to the name of this hero, means a sword, and denotes his warlike character. Some authorities say that Rama was educated by Siva; and, going one day to pay his respects on Kailasa, he was prevented from entering by Genefa, or Pollear, whom he knew not. Enraged at his insolence, he wrenched a scimeter from his hand, and cut off his head, and was hence furnished *Parasu*, "the cutter-off." See POLLEAR and RAMA.

PARASYNEX'IS, *f.* [Greek.] In the civil law, a conventicle, or unlawful meeting.

PARATECA, a town of Brasil, on the Francisco: 240 miles south-west of St. Salvador.

PARATELLA, town of Hindoostan, in the circar of Condapilly: five miles north of Condapilly.

PARATHESIS, *f.* in the Greek church, the prayer which the bishop rehearses to the catechumens, stretching his hands over them to give them benediction; and which they receive, bowing their heads under his hands.

PARATHESIS, in grammar, signifies apposition; or a figure whereby two or more substantives are put in the same case.

PARATHREMA, *f.* [from *παρεα*, and *αρθρον*, a joint.] In surgery, a luxation or dislocation. Also a tumour caused by a protrusion of parts; a rupture, or hernia.

PARATIANÆ, in ancient geography, a town of Africa, in Mauritania Cafariensis, on the route from Lemna to Hippona, between Ruscades and Calucitena, according to the Itin. of Antonine.

PARATILMUS, *f.* [Greek; of *παρειλλαιν*, to tear, or pluck up.] In the ancient Greek jurisprudence, a name given to a sort of punishment imposed on adulterers who were poor, and unable to pay the common penalty. It

consisted either in making them run a horse-radish up the anus, or in tearing up by the roots the hair about the private parts.

PARATINGA. See XINGU.

PARATITLES, *f.* Short notes, or summaries of the titles of the Digest and Code; which have been made by several lawyers, in order to compare and examine the connexion of the several parts with one another.—We have *Paratitles* of Cujas, of Maran, &c. Chassaneus has a comment on the *Paratitles* of Cujas. *Chambers*.

PARATOLA, a town of Bengal: eight miles south-west from Islamabad.

PARATOUNKA, an offshoot of Kamitchatka, on a river which runs into the Avatcha: ten miles west of St. Peter and St. Paul.

PARATURE, *f.* [from the Lat. *paratus*, made ready.] A preparation. *Cole*.

PARAVAIL, *adj.* [Fr. *per* and *avayer*, to dismiss.] An epithet for the lowest tenant of a fee.—The king was styled lord paramount; A was both tenant and lord, or was a mesne lord; and B was called tenant *paravail*, or the lowest tenant; being he who is supposed to make *avail* or profit of the land. *Blackstone*.—Let the pope no longer count himself lord paramount over the princes of the world, no longer hold kings as his servants *paravail*. *Hooker's Disc. of Justification*, 1612.

PARAVANGAH, two small islands near the coast of Bengal. Lat. 22. 50. N. lon. 89. 35. E.

PARAVANI, a town of Turkish Armenia: fifty miles east-south-east of Akalzikh.

PARAVAUNT, *adv.* [*par avant*, Fr.] Publicly; in front. *Obsolete*.

That fair one,

That in the midst was placed *paravaunt*,
Was she to whom that shepherd pip'd alone. *Spencer*.

PARAUTE, a town of South America, in the province of Venezuela, on lake Maracaybo: eighty miles south of Venezuela.

PARAWA', a town of India, on the route from Agra to Oujein; fourteen miles and a half north-west from Soofneer. The soil in its vicinity is black and spongy, like most of Malava or Malwa, but little cultivated. The district dependent on this town yields one lack of rupees annually. *Asiatic Researches*, vol. vi.

PARA'Y LE MONIAL, a town of France, in the department of the Saône and Loire, near the river Bourbince: six miles west of Charolles, and sixteen east-south-east of Bourbon Lancy. Lat. 46. 27. N. lon. 4. 12. E.

PARAZONIUM, *f.* among medalists, a sceptre rounded at the two ends in form of a truncheon, or commander's staff; or a kind of poignard, or short sword, represented as worn at the girdle, on several ancient medals.—Antiquaries are much divided on the explication of the *parazonium*; as, indeed, the form and manner of bearing it are very different. It is sometimes thrown across the shoulders in manner of a quiver. *Chambers*.

PARBOSENA, in ancient geography, a town of Asia, in the environs of Cappadocia, upon the route from Tavia to Sebaste, between Sibora and Carniana, according to the Itinerary of Antonine.

PAR'BAR, *f.* [Hebrew.] A gate or building belonging to the temple. *Ath*.

To PAR'BOIL, *v. a.* [*parbouillir*, Fr. from the Lat. *parum*, a little, and *bullire*, to boil.] To half-boil; to boil in part, or slightly.—*Parboil* two large capons upon a soft fire, by the space of an hour, till, in effect, all the blood be gone. *Bacon*.

From the sea into the ship we turn,
Like *parboil'd* wretches on the coals to burn. *Donne*.

To PAR'BREAK, *v. n.* [*Bræken*, Teut. to vomit; *bræcke*, nausea: *par* seems to be an arbitrary prefix.] To vomit. *Obsolete*.

And virulently disgorged,
As though ye wold *parbreak*

Skelton's Poems.

TO PAR'BREAK, *v. a.* To eject from the stomach.—If thou findest honey, eate so much as is sufficient for thee, lest thou be over full, and *parbreake* it out agayne. *Prov. xxv. 16.* (edit. 1569.)

PAR'BREAK, *f.* Vomit.—Her filthy *parbreak* all the place defiled has. *Spenser.*

PAR'CE, in mythology, powerful goddesses who presided over the birth and the life of mankind. They were three in number, Clotho, Lachesis, and Atropos, daughters of Nox and Erebus, according to Hesiod, or of Jupiter and Themis, according to the same poet in another poem. Some make them daughters of the sea. Clotho, the youngest of the sisters, presided over the moment in which we are born, and held a distaff in her hand; Lachesis spun out all the events and actions of our life; and Atropos, the eldest of the three, cut the thread of human life with a pair of scissors. Their different functions are well expressed in this ancient verse: *Clotho colum retinet, Lachesis nit, et Atropos occidit.*

The name of the Parcae, according to Varro, is derived à *partu* or *parturiendo*, because they presided over the birth of men; but by Servius it is explained *quod nemini parant*, because they spare nobody. Their power was great and extensive. Some suppose that they were subjected to none of the gods but Jupiter; while others support, that even Jupiter himself was obedient to their commands; and indeed we see the father of the gods in Homer's Iliad unwilling to let Patroclus perish, yet obliged by the superior power of the Fates to abandon him to his destiny. According to the more received opinions, they were the arbiters of the life and death of mankind; and whatever good or evil befalls us in this world, immediately proceeds from the Fates, or Parcae. Some make them ministers of the king of hell, and represent them as sitting at the foot of his throne; others represent them as placed on radiant thrones, amidst the celestial spheres, clothed in robes spangled with stars, and wearing crowns on their heads. According to Pausanias, the names of the Parcae were different from those already mentioned. The most ancient of all, as the geographer observes, was Venus Urania, who presided over the birth of men; the second was Fortune; Ilithya was the third. To these some add a fourth, Proserpina, who often disputes with Atropos the right of cutting the thread of human life.

The worship of the Parcae was fully established in some cities of Greece; and, though mankind were well convinced that they were inexorable, and that it was impossible to mitigate them, yet they were eager to show a proper respect for their divinity, by raising them temples and statues. They received the same worship as the Furies; and their votaries yearly sacrificed to them black sheep, during which solemnity the priests were obliged to wear garlands of flowers. The Parcae were generally represented as three old women, with chaplets made of wool, and interwoven with the flowers of the narcissus. They were covered with a white robe, and a fillet of the same colour, bound with chaplets. One of them held a distaff, another the spindle, and the third was armed with scissors, with which she cut the thread which her sisters had spun. Their dress is differently represented by some authors. Clotho appears in a variegated robe, and on her head is a crown of seven stars. She holds a distaff in her hand reaching from heaven to earth. The robe which Lachesis wore was variegated with a great number of stars; and near her were placed a variety of spindles. Atropos was clothed in black; she held scissors in her hand, with clues of thread of different sizes, according to the length and shortness of the lives whose destinies they seemed to contain.

PAR'CAS, a town of Wallachia: sixteen miles south of Brancovani.

PARCAY', a town of France, in the department of the Mayne and Loire: twelve miles south-east of Baugé, and fourteen north-east of Saumur.

VOL. XVIII. No. 1254.

PARCE', a town of France, in the department of the Ille and Vilaine: four miles south of Fougères.

PARCE' a town of France, in the department of the Sarte: six miles east of Sablé, and eighteen south-west of Le Mans.

PAR'CEL, *f.* [*parcelle*, Fr. *particula*, Lat.] A small bundle; a part of the whole; a part taken separately.—With what face could such a great man have begged such a *parcel* of the crown-lands; one a vast sum of money, another the forfeited estate? *Davenant*.—I have known pensions given to particular persons, any one of which, if divided into smaller *parcels*, and distributed to those who distinguished themselves by wit or learning, would answer the end. *Swift*.

I drew from her a prayer of earnest heart,
That I would all my pilgrimage delate,
Whereof by *parcels* she had something heard. *Shakesp.*

An inventory, thus importing
The several *parcels* of his plate, his treasure,
Rich stuffs, and ornaments of household. *Shakespeare.*

A quantity or mass.—What can be rationally conceived in so transparent a substance as water for the production of these colours, besides the various sizes of its fluid and globular *parcels*. *Newton*.—A number of persons: in contempt:

This youthful *parcel*
Of noble batchelors stand at my bestowing. *Shakesp.*

Any number or quantity: in contempt.—They came to this conclusion; that, unless they could, by a *parcel* of fair words and pretences, engage them into a confederacy, there was no good to be done. *L'Estrange*.

TO PAR'CEL, *v. a.* To divide into portions; with *out*.—If they allot and *parcel out* several perfections to several deities, do they not, by this, assert contradictions, making deity only to such a measure perfect? whereas a deity implies perfection beyond all measure. *South*.

Those ghostly kings would *parcel out* my power,
And all the fatness of my land devour. *Dryden*.

To make up into a mass.—What a wounding shame, that mine own servant should *parcel* the sum of my disgraces by addition of his envy! *Shakespeare*.—To strengthen by laying on a strip of canvass; a sea-term.

PAR'CELLING, *f.* In ship-building, long narrow slips of canvas payed or dipt in soft tar, which are bound round the surface of ropes in spiral turns, as smoothly as possible, before it is *servel*, that the rope may not be uneven, or full of ridges, and to further preserve it from the injuries of weather, &c.

PARCELLING a *Seam*, is laying a slip of canvas, prepared as above, over the seam, first paying under it, and then over it, with soft tar or melted pitch. This should be always performed when seams are covered by the cheeks of the heads, &c. or, what is better, covered with sheet copper.

PAR'CEL-MAKER, *f.* One of the two officers in the exchequer who make up the accounts of the escheator.

PAR'CELOR a mountain of Asia, on the coast of Salengore, near the Straits of Malacca. Lat. 2. 45. N. lon. 101. 29. E.

PAR'CENER, *f.* [quasi *parceller*, i. e. rem in *parcellas* dividens. *Cowel*.] A *parcener* is according to the course of the common law, or according to custom.—Where a person seized in fee-simple (or fee-tail) dies, and his next heirs are two or more females, his daughters, sisters, aunts, cousins, or their representatives; in this case they shall all inherit by *common law*; and these coheirs are then called *coparceners*; or, for brevity, *parceners* only. *Parceners* by particular custom are where lands descend, as in gavelkind, to all the males in equal degree, as sons, brother, uncles, &c. In either of these cases, all the *parceners* put together make but one heir. *Blackstone*.

Parceners are so called, says Littleton, because they
5 P may

may be constrained to make *partition*, of which there are several kinds. The properties of parceners are, in some respects, like those of *joint-tenants*, as they have the same unities of interest, title, and possession. They may sue and be sued jointly for matters relating to their own lands, (Co. Litt. 164,) and the entry of one of them shall, in some cases, enure as the entry of them all. (Ibid. 188, 243.) They cannot have an action of trespass against each other; but herein they differ from joint-tenants, that they are also excluded from maintaining an action of waste; (2 Inst. 403,) for co-parceners could at all times put a stop to any waste by writ of partition, but till the statute of Henry VIII. joint-tenants had no such power. Parceners also differ materially from joint-tenants in other points. 1. They always claim by descent, whereas joint-tenants always claim by purchase. 2. There is no unity of time necessary to an estate in co-parcenary. 3. Parceners, though they have an unity, have not entirety, of interest. See *JOINT-TENANT*.

PAR'CENERY, *f.* The tenure of lands by co-parceners.

To PARCH, *v. a.* [from *περιζαειν*, says Junius; from *percoquo*, says Skinner; neither of them seems satisfied with their conjecture: perhaps from *perustus*, burnt, to *perust*, to parch; or perhaps from *parchment*, the effect of fire upon parchment being almost proverbial.] To burn slightly and superficially; to scorch; to dry up.—Without this circular motion of our earth, one hemisphere would be condemned to perpetual cold and darkness, the other continually roasted and *parched* by the sun-beams. *Ray*.

I'm stupify'd with sorrow, past relief
Of tears; *parch'd* up and wither'd with my grief. *Dryden*.

To PARCH, *v. n.* To be scorched.—If, to prevent the acrospiring, it be thrown thin, many corns will dry and *parch* into barley. *Mortimer*.

We were better *parch* in Africk sun,
Than in the pride and salt scorn of his eyes. *Shakespeare*.

PAR'CHEDNESS, *f.* State of being dried up.—A barren heath, that feeds neither cow nor horse; neither sheep nor shepherd is to be seen there; but only a waste silent solitude, and one uniform *parchedness* and vacuity. *More's Conj. Cubb.* 1653.

PAR'CHIM, a town of the duchy of Mecklenburg, on the Elda, which divides it into New and Old Town, in each of which is a church. It has several times suffered by fire. The number of souls is about 3000: thirty-four miles south of Wismar, and fifty-five east of Lauenburg. Lat. 53. 28. N. lon. 11. 55. E.

PAR'CHMENT, *f.* [*pergamena*, Lat.] Sheep or goats skin prepared after a peculiar manner, which renders it proper for several uses; particularly for writing on, for the covering of books, &c.—Is not this a lamentable thing, that the skin of an innocent lamb should be made *parchment*; that *parchment*, being scribbled o'er, should undo a man? *Shakespeare's Hen. VI.*—In the coffin, that had the books, they were found as fresh as if newly written, being written in *parchment*, and covered with watch-candles of wax. *Bacon*.

Like flying shades before the clouds we shew,
We shrink like *parchment* in consuming flame. *Dryden*.

The word *pergamena*, the ancient name of this manufacture, is said to have been taken from the city of Pergamos, to Eumenes, king whereof, its invention is usually ascribed; though, in reality, that prince appears rather to have been the improver than the inventor of parchment; for the Persians of old, according to Diodorus, wrote all their records on skins; and the ancient Ionians, as we are told by Herodotus, made use of sheep-skins and goat-skins in writing, many ages before Eumenes's time. Nor need we doubt, that such skins were prepared and dressed for that purpose, after a manner not unlike that of our parchment, though probably not so artificially.

Dr. Prideaux is a strenuous advocate for the antiquity

of parchment; and he imagines that the authentic copy of the law which Hilkiah found in the Temple, and sent to king Josiah, was formed of this material; because no other used for writing, parchment excepted, could be of so durable a nature as to last from the time of Moses till that period, i. e. 830 years. But it has been replied to this argument, that the Egyptians wrote on linen those things which they designed for long duration; and those who have examined mummies with attention, assure us, that the characters so written continue to this day. It is not, therefore, improbable, that a copy of the law of Moses, written after this manner, might have lasted 830 years. Besides, it is not very likely that those skins which were used, according to the testimony of Diodorus and Herodotus, by the Persians and Romans for writing, long before the time of Eumenes, were dressed like parchment. They must have been prepared in a much ruder manner, and have little resembled the parchment of which Eumenes is said to be the inventor; because, if it had been found out before, it would have rendered the want of the Egyptian papyrus no inconvenience to that prince. Such skins might do for records, and for some occasional writings, but would have been by no means proper for books. Hence some writers have concluded, that parchment was a later invention than the Egyptian paper.

MANUFACTURE OF PARCHMENT.—The manufacture of parchment is begun by the skinner, and finished by the parchment-maker properly so called.

1. The skin having been stript of its wool, and having passed the lime-pit, (after the manner described under the article *LEATHER*,) the skinner stretches it on a kind of frame, consisting of four pieces of wood, mortised into each other at the four angles, and perforated lengthways, from distance to distance, with holes furnished with wooden pins, that may be turned at pleasure, like those of a violin. To stretch the skin on this frame, they make little holes all round it, and through every two holes draw a little skewer; to this skewer they tie a small piece of packthread, and tie that over the pins; so that, coming to turn the pins equally, the skin is strained tight every way, like that of a drum.

The skin being thus sufficiently stretched on the frame, the flesh is pared off with a sharp instrument for that purpose; this done, it is moistened with a rag; and a kind of white stone, or chalk, reduced to a fine dust, is strewed over it: then, with a large pumice-stone, flat at bottom, much after the manner of a muller for grinding colours, they rub over the skin as if about to grind the chalk; and thus they scour off the remains of the flesh. Then they go over it again with the iron instrument; again moisten it as before, and again rub it with a pumice-stone without any chalk underneath; this smoothenes and softens the flesh-side very considerably. They then drain it again, by passing over it the iron instrument as before.

The flesh-side being thus drained, they pass the iron on the wool or hair side; then stretch it tight on the frame, by means of the pins, and go over the flesh-side again with the iron; this finishes its draining; and, the more the skin is drained, the whiter it always becomes. They now throw on more chalk, sweeping it over with a piece of lamb-skin that has the wool on; this smoothenes it still farther, and gives it a white down or knap. It is now left to dry. and when dried it is taken off the frame, by cutting it round.

2. The skin, thus far prepared by the skinner, is taken out of his hands by the parchment-maker, who first scrapes or pares it dry on the *summer* with an iron instrument like that used by the skinner, only finer and sharper; with this, worked with the arm from top to bottom of the skin, he takes away about one-half of its thickness. The skin thus equally pared on both sides, they pass the pumice-stone over both sides, to smoothen it. This last preparation is performed on a kind of form or bench covered with a sack stuffed with flocks; and it leaves the parchment in a condition for writing on.

The

The paring of the skin dry on the summer is the most difficult preparation in the whole process of parchment-making; for which reason, the skinners seldom dare meddle with it, but usually leave it to those more experienced in it; the summer, whereon it is performed, is a calf-skin well-stretched on a frame, serving as a support to the skin, which is fastened a-top of it with a wooden instrument, that has a notch cut in it. Lastly, that the iron knife may pass the easier between the summer and the skin to be pared, they put another skin, which they call the counter-summer. The parings, thus taken off the skin, are used in making glue, size, &c.

That called *virgin parchment* is somewhat thinner and finer than the rest; and is most proper for certain purposes, as fans, &c. it is made of the skin of an abortive lamb, or kid.

What we call *vellum*, is only parchment made of the skins of abortive calves, or at least of sucking-calves; it is finer, whiter, and smoother, than the common parchment; but it is prepared in the same manner as that, except that it is not passed through the lime-pit.

To make Coloured Parchment.—Wash the parchment in cold ley, till it come clear from it; then squeeze out the liquor as much as possible; and, if you would have it of a fine green colour, take distilled verdigris, ground with vinegar, and add a little sap-green to it; temper it neither too thick nor too thin; then soak your parchment in this colour thoroughly a whole night; rinse it afterwards in water, strain it immediately on a frame, and set it to dry; take clear varnish, lay it on both sides, set it in the sun to dry; after this cut the parchment out of the frame into leaves, as large as you please, and lay them in a book under press, to keep them fine and straight. The effect of this parchment is to make a small letter, when put over it, appear as big again; and it is a great preserver of the eyes, especially to those that read much by candle-light. The varnish must be prepared of linseed-oil, and boiled with frankincense, mastic, and sandarac.

If you would have the parchment of a clear, transparent, and white, colour, only wash, strain, and varnish it, as above. If you would colour it yellow, steep your parchment, after it has been washed, in a yellow liquid, made of saffron; for which purpose, tie saffron in a thin linen rag, hang it in a weak ley, and warm it over a slow fire; and, when you see the ley tinged yellow, it is fit for use.

For a transparent Red.—Take brazil, as much as you will: put it into a hot ley, which is clear, and not too strong, and it will tincture the ley of a fine red; then pour to it about half an egg-shell full of clean wine; draw the parchment through the colour; and, when it is as deep as you would have it, strain it as before.

For a Blue.—Take Lombard indigo, grind it with vinegar on a stone, and mix sal-ammoniac among it, to the quantity of a pea; with this wet your parchment, and proceed as has been directed for the green.

For a Violet or Purple.—Temper two-thirds of the above red, and one-third of the blue, and use it as before directed.

For a Black.—Take Roman alum, beat it into powder, and boil it in rain-water to a fourth part; add Roman vitriol, or atrament, with some Roman galls, and boil them together: with this stain your parchment twice or three times over; and, when dry, lay the Spanish varnish over it.

With these transparent parchments you may make curious bindings. One sort, used at Rome, is made thus: Lay the board or pasteboard over with leaf-gold, leaf-silver, staniel, metal-leaves, &c. then binding the parchment over it, it will give it an uncommon lustre and beauty.

Dr. Lewis informs us, that, in order to render the ink durable on parchment, a thick piece of it should be steeped in water, with some oak-bark, for three or four days, and then pressed smooth and dried. When the surface of this parchment was pared off, and the internal part written

upon, the characters continued of a good black, while those made with the same ink, on unprepared parchment, were changed into a yellowish-brown. Vellum may also be treated in the same manner.

It is said, that writing upon parchment decayed by time, may be recovered, and rendered legible, by dipping the obliterated parchment into a vessel of cold water, fresh drawn from the well; let it be taken out in about a minute, and pressed between two papers, in order to prevent its crumpling up in drying. As soon as it is moderately dry, if it be not legible, repeat the operation two or three times.

Old skins of parchment or vellum may be converted into leather. See the article LEATHER, vol. xii. p. 423.

PAR'CHMENT-MAKER, f. He who dresses parchment.

PARCHOOR, a town of Hindoostan, in the circar of Guntoor: eighteen miles south of Guntoor.

PAR'CHWITZ, a town of Silesia, in the principality of Liegnitz, and capital of a prefecture; containing two Lutheran churches, and a Roman-catholic chapel. Here is a manufacture of cloth: ten miles north-east of Liegnitz, and twelve west of Wohlau. Lat. 51.15. N. lon. 16.20. E.

PARCIEUX (Anthony des), a French mathematician, and member of the Academy of Sciences, was born in the diocese of Uzes in 1703. He taught the mathematics at Paris with great reputation, and died there in 1768. His works are, 1. A Treatise of Trigonometry. 2. Essays on the Probability of the Duration of Life. 3. Memoirs on the Practicability of bringing to Paris the Water of the River d'Yvette. Of the tables of M. des Parcieux on the probability of life, great use has been made by the writers on the doctrine of annuities.

He had a nephew of the same name, who was educated at the college of Navarre at Paris, where he studied mathematics and philosophy, and, at the age of twenty-four, gave public lectures. In 1779 he began a course of experimental philosophy, in the military school of Brienne; after which, he occupied the philosophical professorship at the Lyceum in Paris, where he died in 1798. He wrote an elementary book on Geometrical and Astronomical Calculations; and in his youth he is said to have composed a tragedy, entitled *Ozorio*.

PAR'CITY, f. [*parcitas*, Lat.] Spargingness. *Not in use.*
PAR'CO FRAC'TO, or **POUND-BREACH, f.** in law, a writ which lies against him who violently breaks open a pound, and takes out beasts thence, which, for some trespass done, were lawfully impounded.

PARCO'L, or **PARCOU'L**, a lake of Thibet, twenty-five miles in circumference. Lat. 43.22. N. lon. 92.42. E.

PAR'COS, a town of Peru, in the diocese of Guamanga: twenty-five miles north-east of Guancavelica.

PARCOU', a town of France, in the department of the Lower Charente: twelve miles east of Montlieu.

PARCO'W, a town of Austrian Poland, in Galica: thirty-six miles north-north-east of Lublin.

PARD, or **PAR'DALE, f.** [*pard*, Sax. *pardus*, *pardalis*, Lat.] The *Felis pardus*, or panther. In poetry, any of the spotted beasts.—The *pardale* swift, and the tyger cruel. *Spenser's F. Q.*

As fox to lambs, as wolf to heifer's calf;

As *pard* to hind, or stepdame to her son. *Shakespeare.*

PARDAILLO'N, a town of France, in the department of the Lot and Garonne: five miles west of Lauzun, and twelve north of Marmande.

PARDALIAN'CHES, f. in botany. See *DORONICUM*.

PARDANTHUS, f. in botany. See *IXIA Chinenfis*.

PARDIES (Ignatius-Gaston), a French Jesuit, an ingenious mathematician and philosopher, was the son of a counsellor of the parliament of Pau in Bearn, where he was born, in the year 1636. He entered the society of Jesuits when he was about the age of sixteen; and pursued his studies with so much diligence and success, that he

was:

was appointed tutor in polite literature, and composed many pieces in prose and verse, distinguished by delicacy of thought and elegance of style, when he had scarcely arrived at the age of manhood. His genius, however, chiefly inclined him to philosophical and mathematical studies, to which he devoted himself with the greatest ardour, reading the most valuable authors in those sciences, ancient and modern; so that in a short time he made himself master of the Peripatetic and Cartesian philosophy, and taught them both with great reputation. After having displayed his skill in the speculative sciences, with great reputation, in different provinces, he was called to Paris, to be professor of rhetoric in the college of Louis the Great. Here he also taught the mathematics, and acquired so much fame by his lectures and publications, that his acquaintance was sought for by all the learned men of the metropolis, and the highest expectations were formed from his future labours. Unhappily, the sanguine hopes of his friends were blasted by his premature death in 1673, when he was only thirty-seven years of age. This event is attributed to a malignant disorder which he caught, while zealously discharging the duties of preacher and confessor at the Bicêtre during the festival of Easter. He wrote with neatness and conciseness, and in a style sufficiently pure, if we except a few provincial expressions. His principal productions are, 1. *Horologium thaumaticum duplex*, 1662, 4to. 2. *Dissertatio de Motu et Natura Cometarum*, 1665, 8vo. 3. *A Discourse on local Movement*, 1670, 12mo. 4. *Elements of Geometry*, 1670, 12mo. which have been translated into several languages, and into English by Dr. Harris. 5. *A Discourse concerning the Knowledge of Beasts*, 1672, 12mo. 6. *Statistics, or the Science of moving Forces*, 1673, 12mo. 7. *Description and Explanation of two Machines for facilitating the Construction of Sundials*, 1673, 12mo. 8. *Observations on the Movement of Light*. 9. *Globi Cælestis in Tabula plana redacti Descriptio*; published after the author's death, in 1675, folio, &c. The greatest part of his works was printed in a collected form at the Hague, in 1691, 12mo. and again at Lyons, in 1725. The author also had a dispute with sir Isaac Newton, concerning his New Theory of Light and Colours, in 1672; and his letters are inserted in the Philosophical Transactions for that year. *Hutton's Math. Dictionary*.

PAR'DO, a river of Paraguay, which runs into the Parana.

PAR'DO (El), a town of Spain, in New Castile, where the king has a palace: seven miles north of Madrid.

PAR'DO, or PARDAO, *f.* A silver coin, and money of account, at Goa.

To PAR'DON, *v. a.* [*pardonner*, Fr.] To excuse an offender:

When I beheld you in Cilicia,
An enemy to Rome, I pardon'd you. *Dryden.*

To forgive a crime.—I will pardon all their iniquities. *Jer.* xxxiii. 8.

Forgiveness to the injur'd does belong,
But they ne'er pardon who commit the wrong. *Dryden.*

To remit a penalty:

That thou may'st see the difference of our spirit,
I pardon thee thy life before thou ask it. *Shakespeare.*

Pardon me, is a word of civil denial or slight apology.—Sir, *pardon me*; it is a letter from my brother. *Shakefp.*

PAR'DON, *f.* [*French.*] Forgiveness of an offender.—Forgiveness of a crime.—He that pleaseth great men shall get pardon for iniquity. *Eccly.* xx. 27.

What better can we do than prostrate fall
Before him reverent, and there confess
Humbly our faults, and pardon beg with tears
Watering the ground? *Milton's P. L.*

Remission of penalty.—Forgiveness received.—A man may be safe as to his condition, but, in the mean time, dark and doubtful as to his apprehensions; secure in his pardon, but miserable in the ignorance of it; and so, passing all his days in the disconsolate uneasy vicissitudes of hopes and fears, at length go out of the world, not knowing whither he goes. *South's Sermons.*—Warrant of forgiveness, or exemption from punishment:

The battle done, and they within our power,
Shall never see his pardon. *Shakespeare's K. L.*

"Law (says Beccaria) cannot be framed on principles of compassion to guilt; yet justice, by the constitution of England, is bound to be administered in mercy: this is promised by the king in his coronation-oath; and it is that act of his government which is the most personal, and most entirely his own."

There are three swords carried before the king at his coronation, besides the sword of state; the first of which, named *curtana*, belonged to Edward the Confessor, and has been used at the public inaugurations of our princes ever since. The length of the blade is now 32 inches; originally it was much longer; but it has been broken off at the point, to betoken mercy, justly reckoned the brightest prerogative of the sovereign. Edward III. when he was crowned, on the 1st of February, 1327, was the first of our kings who, in the exertion of that prerogative, proclaimed a GENERAL PARDON, which has been since practised by succeeding monarchs.

This power of pardoning offences is inseparably incident to, and is the most amiable prerogative of, the crown. Anciently the right of pardoning offences, within certain districts, was claimed by lords, who had *jura regalia* by ancient grants from the crown, or by prescription. But by stat. 27 Hen. VIII. c. 24. it was enacted, "that no person shall have power to pardon any treasons or felonies, nor any accessories, nor outlawries; but that the king shall have the authority thereof, united to the crown of this realm, as of right it appertaineth."

Judge Blackstone observes, that this is one of the great advantages of monarchy in general, above any other form of government; that there is a magistrate, who has it in his power to extend mercy, whatever he thinks it is deserved; holding a court of equity in his own breast, to soften the rigour of the general laws, in such criminal cases as merit exemption from punishment. Some theorists, however, maintain, that pardons should be excluded in a perfect legislation, where punishments are mild, but certain; because the clemency of the prince seems to be a tacit disapprobation of the laws. But the exclusion of pardons must necessarily introduce a very dangerous power in the judge or jury, that of construing the criminal law by the spirit instead of the letter; (see Beccaria, ch. 4. and 46.) or else it must be holden, what no man will seriously avow, that the situation and circumstances of the offender, though they alter not the essence of the crime, ought to make no distinction in the punishment. In democracies, however, this power of pardon can never subsist; for there nothing higher is acknowledged than the magistrate who administers the laws; and it would be impolitic for the power of judging and of pardoning to centre in one and the same person. This, as Montesquieu observes, (*Sp. of Laws*, book vi. c. 5.) would oblige him very often to contradict himself, to make and unmake his decisions: it would tend to confound all ideas of right among the mass of the people; as they would find it difficult to tell, whether a prisoner were discharged by his innocence, or obtained a pardon through favour. In monarchies, the king acts in a superior sphere; and, though he regulates the whole government as the first mover, yet he does not appear in any of the disagreeable or invidious parts of it. Whenever the nation sees him personally engaged, it is only in works of legislation, magnificence, or compassion. To him, therefore, the people

people look up as the fountain merely of bounty and grace; and these repeated acts of goodness, proceeding immediately from himself, endear the sovereign to his subjects, and contribute more than any thing to root in their hearts that filial affection and personal loyalty, which are the sure establishment of a prince. In the exercise of this prerogative, however, the sovereign should be directed by a sound discretion and impartial judgment, and also by wise and upright counsellors; and the occasions for the exercise of it should be rendered as few and unfrequent as possible, by mitigating the severity of our criminal laws, and lessening their number, and making the penalties annexed to the violation of them more definite and certain.

A pardon may be pleaded in arrest of judgment; in which case it has the same advantage as when pleaded upon arraignment; viz. the saving the attainder, and of course the corruption of blood, which nothing can restore but parliament, when a pardon is not pleaded till after sentence. And certainly, on all accounts, when a man hath obtained a pardon, he is in the right to plead it as soon as possible.

The king may pardon all offences merely against the crown, or the public; excepting, 1. That, to preserve the liberty of the subject, the committing any man to prison out of the realm is, by the habeas-corpus act, made a præmunire, unpardonable even by the king. Nor, 2. Can the king pardon, where private justice is principally concerned in the prosecution of offenders: *Non potest rex gratiam facere cum injuria et damno aliorum*. Therefore, in appeals of all kinds (which are the suit, not of the king, but of the party injured), the prosecutor may release; but the king cannot pardon. Neither can he pardon a common nuisance while it remains unredressed, or so as to prevent an abatement of it; though afterwards he may remit the fine: because, though the prosecution is vested in the king to avoid the multiplicity of suits, yet (during its continuance) this offence favours more of the nature of a private injury to each individual in the neighbourhood, than of a public wrong. Neither, lastly, can the king pardon an offence against a popular or penal statute, after information brought: for thereby the informer hath acquired a private property in his part of the penalty.

3. There is also a restriction of a peculiar nature, that affects the prerogative of pardoning, in the case of parliamentary impeachments, viz. that the king's pardon cannot be pleaded to any such impeachment, so as to impede the inquiry, and stop the prosecution of great and notorious offenders. Therefore, when, in the reign of Charles II. the earl of Danby was impeached by the house of commons of high-treason and other misdemeanors, and pleaded the king's pardon in bar of the same, the commons alleged, "That there was no precedent that ever any pardon was granted to any person impeached by the commons of high-treason, or other high crimes, depending the impeachment;" and thereupon resolved, "That the pardon so pleaded was illegal and void, and ought not to be allowed in bar of the impeachment of the commons of England:" for which resolution they assigned this reason to the house of lords, "That the setting up a pardon to be a bar of an impeachment defeats the whole use and effect of impeachments: for, should this point be admitted, or stand doubted, it would totally discourage the exhibiting any for the future; whereby the chief institution for the preservation of the government would be destroyed." Soon after the Revolution, the commons renewed the same claim, and voted, "That a pardon is not pleadable in bar of an impeachment." And at length, it was enacted by the act of settlement, 12 and 13 W. III. c. 2. "That no pardon under the great seal of England shall be pleadable to an impeachment by the commons in parliament." But, after the impeachment has been solemnly heard and determined, it is not understood that the king's royal grace is farther restrained or abridged: for, after the impeachment and attainder of the six rebel

lords, 1715, three of them were from time to time reprieved by the crown, and at length received the benefit of the king's most gracious pardon. The effect of such pardon by the king, is to make the offender a new man; to acquit him of all corporal penalties and forfeitures annexed to that offence for which he obtains his pardon; and not so much to restore his former, as to give him a new credit and capacity. But nothing can restore or purify the blood when once corrupted, if the pardon be not allowed till after attainder, but the high and transcendent power of parliament. Yet, if a person attainted receive the king's pardon, and afterwards hath a son, that son may be heir to his father; because the father, being made a new man, might transmit new inheritable blood; though, had he been born before the pardon, he could never have inherited at all.

As to the manner of pardoning, it must be under the great seal; and it is a general rule, that, wherever it may be reasonably presumed the king is deceived, the pardon is void; so that any suppression of truth, or suggestion of falsehood, in a charter of pardon, will vitiate the whole; for the king was misinformed. 3 Inst. 238. Generally, words have also a very imperfect effect in pardons. A pardon of all felonies will not pardon a conviction or attainder of felony, but these must be particularly mentioned. 2 Hawk. P. C. 383. Nor will a pardon of felonies include piracy, which is not punishable at the common law. 1 Hawk. P. C. 94. It is also enacted by 13 Ric. II. st. 2. c. 1. that no pardon for treason, murder, or rape, shall be allowed, unless the offence be particularly specified; and in murder it shall be expressed, whether it was committed by lying in wait, assault, or malice prepense. Upon which Coke observes, that it was not the intention of the parliament that the king should ever pardon murder under these aggravations; and therefore they prudently laid the pardon under these restrictions, because they did not conceive it possible that the king would ever excuse an offence by name, which was attended with such high aggravations. 3 Inst. 236. And it is remarkable enough, that there is no precedent of a pardon in the register for any other homicide than that which happens *se defendendo*, or *per infortunium*; to which two species the king's pardon was expressly confined by the stats. 2 Ed. III. c. 2. and 14 Ed. III. c. 15. which declare that no pardon of homicide shall be granted, but only where the king may do it *by the oath of his crown*; that is to say, where a man slayeth another in his own defence, or by misfortune. But the stat. 13 Ric. II. st. 2. c. 1. enlarges by implication the royal power; provided the king is not deceived in the intended object of his mercy.

The fees, paid upon each pardon granted under the great seal, amount, according to a return made to parliament in the year 1818, to no less a sum than 50l. 17s. 8d.

A pardon may be conditional; that is, the king may extend his mercy upon what terms he pleases; and may annex to his bounty a condition either precedent or subsequent, on the performance whereof the validity of the pardon will depend; and this by the common law. 2 Hawk. P. C. c. 37. Which prerogative is daily exerted in the pardon of felons; on condition of being confined to hard labour for a stated time; or of transportation to some foreign country for life, or for a term of years. We shall conclude this article by inserting the form of one of these conditional pardons.

L. S. GEORGE P. R.

In the name and on the behalf of his Majesty.

Whereas William Mann and John Newman were, at a Session holden at the Old Bailey in October last, tried and convicted, the said William Mann of house-breaking, and the said John Newman of the like offence, and had sentence of death passed upon them for the same; We, in consideration of some favourable circumstances humbly represented unto us in their behalf, are graciously pleased to extend our grace and mercy unto them, and to grant them our pardon for their said crimes, on condition of

their being delivered over to the Philanthropic Society for Reform. Our will and pleasure therefore is, that you cause them, the said William Mann and John Newman, to be forthwith delivered over to the said Society; and that they be inserted for their said crimes, on the said condition, in our first and next General Pardon that shall come out for the Poor Convicts in Newgate; and for so doing this shall be your warrant.

Given at our Court, at Carlton House, the Seventh day of March, 1811, in the Fifty-first Year of our Reign.

To our Trusty and well-beloved our Justices of Gaol Delivery for the City of London, and County of Middlesex, the Sheriffs of the said City and County, and all others whom it may concern.	By the Command of his Royal Highness the Prince Regent, in the name and on behalf of his Majesty.
---	---

R. RYDER.

PARDON, in the canon law, extends beyond the affairs of this world, being an indulgence which the pope grants to supposed penitents, for remission of the pains of purgatory, which they have merited for the punishment of their sins:

There might you see
Indulgences, dispensers, pardons, bulls,
The sport of winds.

Milton's P. L.

PAR'DONABLE, *adj.* Venial; excusable.—A blind man sitting in the chimney-corner is *pardonable* enough, but sitting at the helm he is intolerable. *South*.—What English readers, unacquainted with Greek or Latin, will believe me, when we confess we derive all that is *pardonable* in us from ancient fountains? *Dryden*.

PAR'DONABLENESS, *f.* Venialness; susceptibility of pardon.—Saint John's word is, All sin is transgression of the law; Saint Paul's, The wages of sin is death. Put these two together, and this conceit of the natural *pardonableness* of sin vanishes away. *Bp. Hall*.

PAR'DONABLY, *adv.* Venially; excusably.—I may judge when I write more or less *pardonably*. *Dryden*.

PAR'DONER, *f.* One who forgives another:

This is his pardon, purchas'd by such sin,
For which the *pardon*er himself is in. *Shakespeare*.

One of those who carried about the pope's indulgencies, and sold them.—To avoide this great travayle, it shall be best for you to saye, as the *pardoners* did by their pardons, and as your purgatorie-priefts saye, No penye, no paternoster! *Confut. of N. Shaxtan*. 1546.

Of his craft fro Berwick unto Ware,
Ne was there swiche another *pardonere*. *Chaucer*.

PAR'DOS, or POMPENAY', a town of Africa, in the district of Anta, on the Gold Coast.

PARDOUX, (St.) a town of France, in the department of the Two Seves: five miles south-south-west of Partenay.

PARDOUX LA RIVIÈRE, (St.) a town of France, in the department of the Dordogne, and chief place of a canton, in the district of Nontron: four miles south-east of Nontron. It contains 1273 inhabitants.

PAR'DUBITZ, a town of Bohemia, in the circle of Chrudim, on the Elbe, fortified and well built. Here is a manufacture of knives and sword-blades: five miles north of Chrudim, and fifty-five east of Prague. Lat. 49. 55. N. lon. 15. 40. E.

PARDU'RABLE, *adj.* Everlasting. *Chaucer*.

To PARE, *v. a.* [may be deduced from the Lat. *parem facere*, as we do in cutting off the exceeding parts of a thing, to make it fit another; *ungues pares facere*, to pare the nails: or, as Skinner says, from the French phrase *parer les ongles*, to dress the horse's hoofs when they are shaved by the farrier: thus we first said "Pare your nails;" and from thence transferred the word to general use.] To cut off extremities of the surface; to cut away by little and little; to diminish.—If *pare* be used before

the thing diminished, it is followed immediately by its accusative; if it precedes the thing taken away, or agrees in the passive voice with the thing taken away, as a nominative, it then requires a particle, as *away*, *off*. *John-son*.—'Twere well if she would *pare* her nails. *Pope*.—The king began to *pare* a little the privilege of clergy, ordaining that clerks convict should be burned in the hand. *Bacon's Hen. VII.*—The Creed of Athanasius, and that sacred Hymn of Glory, than which nothing doth sound more heavenly in the ears of faithful men, are now reckoned as superfluities, which we must in any case *pare away*, lest we cloy God with too much service. *Hooker*.—Whoever will partake of God's secrets, must first look into his own; he must *pare off* whatsoever is amiss, and not without holiness approach to the holiest of all holies. *Bp. Taylor*.

Pick out of tales the mirth, but not the sin;
He *pares* his apple that will cleanly feed. *Herbert*.

I have not alone
Employ'd you where high profits might come home;
But *par'd* my present havings to bestow
My bounties upon you. *Shakespeare's Hen. VIII.*

The lion, mov'd with pity, did endure
To have his princely paws all *par'd away*. *Shakespeare*.

PARÉ (Ambrose), a French surgeon of eminence, was born at Laval, in the district of the Maine, in the year 1509. He commenced the study of his profession early in life, and practised it with great zeal both in hospitals and in the army. Subsequently his reputation rose very high; and he was appointed surgeon in ordinary to king Henry II. in 1552; and he held the same office under the succeeding kings, Francis II. Charles IX. and Henry III. To Charles IX. especially he is said to have conferred great professional benefits, especially on one occasion, when some formidable symptoms had been produced by the accidental wound of a tendon in venesection, which he speedily removed. His services appear to have been amply acknowledged by the king; for, as Paré was a Huguenot, he would have been included in the horrible massacre of St. Bartholomew's, had not the king sent for him on the preceding night, and ordered him not to leave the royal chamber. After having been long esteemed as the first surgeon of his time, and beloved for his private virtues, he died in the year 1590, at the age of eighty-one.

Paré was not a man of learning, and was even obliged to request a physician to make a French translation of some of the books of Galen, which he wished to consult. Nevertheless there is an affectation of much learned reference, and numerous quotations from the ancients, in his writings, which have added nothing to his reputation. There is some justice in the remark of Van Hoorne, that Paré would have done better, if he had limited his publication to a small volume, containing only the records of his own observation and experience. He must be considered, however, as a man of original mind, and a real improver of his art; and as having greatly facilitated and extended the application of several principles of practice, which, according to his own acknowledgment, he derived from the Italian writers and practitioners. Though he did not invent, he greatly promoted, the practice of tying divided arteries, which he effected by drawing them out naked, and passing a ligature over them. He was the author of a great improvement in the treatment of gun-shot wounds, by adopting a lenient method, and rejecting irritants and cauterizations, which were employed by his contemporaries. He was also a bold and successful operator; and records many instructive cases, in which he displayed all the resources of an enlightened surgeon. He did not, however, greatly excel in anatomy, though he had practised dissections; and was chiefly a borrower from the works of Vesalius in this department of science, though not without some observations of his own.

Paré

Paré was the author of some works which were universally read, and translated into most of the languages of Europe. His first treatise, "*Manière de traiter les Playes faites par Harquebuses, Fleches, &c.*" was published at Paris in 1545, and again in 1552 and 1564. He afterwards laboured strenuously to put his brethren in possession of a body of surgical science in their native tongue; and in 1561 published the first edition of his works, in folio. Numerous editions were afterwards printed at Paris, and also at Lyons; and his pupil Guillemeau, who was surgeon to Charles IX. and Henry IV. translated these works into Latin. This translation has been frequently reprinted at various places, with the title of "*Ambrosii Paræi Opera, novis iconibus elegantissimis illustrata, et Latinitate donata.*" This volume contains twenty-six treatises; and there is no branch of surgery which is not touched upon in the collection. *Monthly Mag.* for Oct. 1814.

PARÉ (Philip and Daniel). See PAREUS.

PARECA'LA, a province of the island of Luçon, fertile, and rich in mines of gold and precious stones. About 7000 Indians pay tribute to the Spaniards.

PARECHAM'PA, a town of Bootan: five miles north of Tasasudon.

PARE'CHIA, a small town of the island of Paros, built on the ruins of the ancient Paros, on the west coast of the island, facing Antiparos; but it presents no idea of the ancient city, unless by the beautiful ruins, which are employed equally without reserve and without taste in its construction. Off Parechia, the sea forms a bight and a harbour, whose entrance is difficult, on account of the shoals by which it is obstructed on the opposite coast. Lat. 37. 5. N. lon. 25. 10. E.

PARE'DES, a town of Spain, in Asturia: twenty-five miles north-west of Oviedo.

PARE'DES, a town of Spain in the province of Leon: thirteen miles north-west of Leon.

PARE'DES, a town of Spain, in New Castile: eight miles north of Sigüenza.

PAREDE'DES, a town of Portugal, in Estramadura: twelve miles north-west of Leyria.

PARE'DON DEL ESTE, a small island near the north coast of Cuba. Lat. 22. 16. N. lon. 77. 50. W.

PARE'DON DEL MEDIOS, a small island near the north coast of Cuba. Lat. 22. 16. N. lon. 78. 6. W.

PARE'DRI, *f.* [Greek.] Among the Athenians, when the archon, basileus, or polemarchus, by reason of their youth, happened not to be so well skilled in the laws and customs of their country as might have been wished, it was customary for each of them to make choice of two persons of age, gravity, and reputation, to sit with them upon the bench, and direct them as there was occasion. These assessors were called *paredri*, and were obliged to undergo the same probation in the senate-house and public forum with the other magistrates; and, like them too, to give an account how they had behaved themselves in their respective trusts, when their office was expired.

PARE'DRIA, *f.* A term used by Hippocrates to express an association of two or more diseases in the same patient, making what we call a complicated illness.

PAREGOR'IC, *adj.* [Greek.] Having the power in medicine to comfort, mollify, and assuage.

PAREGOR'IC, *f.* A medical preparation which comforts and assuages; an anodyne.—Tar-water is of admirable use in fevers; being at the same time the surest, safest, and most effectual, both *paregorick* and cordial. *Bp. Berkeley's Sermons.*

PARE'JA (Juan de), a Mestizo, (a Spanish name given to those who are born of a Spanish father, and a mother a native Indian,) whose love for the art of painting was such, that, though the slave of Velasquez, and employed by him to prepare his colours, and attend upon him, yet he contrived in secret to obtain very considerable proficiency in the art. He died at the age of sixty, in 1670.

PARE'ID, a town of France, in the department of the Meuse: twelve miles east of Verdun, and six fourth-fourth-east of Estain.

PARE'IRA, *f.* in botany. See CISSAMPELOS.

PAREL'CON, *f.* [from the Gr. *παρελκυω*, to draw out.] A figure in grammar, in which a letter or syllable is added to the end of a word.

PAREL'LA, a town of France, in the department of the Dora: four miles south-south-west of Ivrea, and twenty north of Turin.

PARELLO'NES, a cluster of small islands in the Spanish main, near the coast of Darien. Lat. 9. 37. N. lon. 79. 30. W.

PAREL'LUS, *f.* in botany. See LICHEN.

PARE'MBOLE, *f.* [Greek.] A figure in rhetoric, wherein something relating to the subject is inserted in the middle of a period. All the difference between the parembolè and parenthesis, according to Vossius, is, that the former relates to the subject in hand, whereas the latter is foreign to it. An example of each we have in Virgil; and first of the parembolè:

Æneas (neque enim patrius consistere mentem

Passus amor) rapidum ad naves præmitit Achatem.

The following is an instance of the parenthesis:

———— ipseque suos jam morte sub ægrâ

(*Di meliora piis, erroremque hostibus illum*)

Discissor nudis laniabant dentibus artus.

PAREMP'TOSIS, *f.* [from the Gr. *παρά*, with, and *εμππτωσις*, a falling between.] A figure in grammar, in which a letter or syllable is thrown into the middle of a word. The fall of the blood from the heart into the great artery.

PARENCEPH'ALOS, *f.* [from the Gr. *παρά*, near, and *κεφαλή*, the head.] The cerebellum.

PARENCHY'MA, *f.* [Greek.] In anatomy, is applied to the substance of glands, and denotes that part of them which constitutes the peculiarity of the organ, the basis, which would remain if the vessels and nerves were removed. It is often used more generally, for any kind of spongy or porous flesh, as that of which the lungs and heart are composed, and through which the blood is strained for its better fermentation and perfection. And hence Dr. Grew gives the name parenchyma to the pith or pulp, or that inner part of a fruit or plant, through which the juice is supposed to be distributed.

PARENCHYM'ATOUS, or PAREN'CHYMOUS, *adj.* Relating to the parenchyma; spongy.—Ten thousand seeds of the plant hart's-tongue hardly make the bulk of a pepper-corn. Now the covers and true body of each seed, the *parenchymatous* and ligneous parts of both moderately multiplied, afford an hundred thousand millions of formed atoms in the space of a pepper-corn. *Grew.*—The lungs, and all the other *parenchymous* parts of the bowels. *Smith on Old Age.*—Those parts, formerly reckoned *parenchymatous*, are now found to be bundles of exceedingly small threads. *Cheyne.*

PARENESIS, *f.* [Greek.] Persuasion; exhortation.

PARENET'IC, or PARENETICAL, *adj.* [*παραινετικός*, Gr.] Hortatory; encouraging.—In an epistle *paranetical* to the pope himself, S. Bernard might have leave to use allusions, and after his manner to be liberal of all that the see of Rome challenged. *Bp. Bedell's Letters.*

PARENET'IC, *f.* A masterly or authoritative admonition. *Cole.*

PA'RENT, *f.* [Fr. from *parens*, Lat.] A father or mother.—His custom was, during the warmer season of the year, to spend an hour before evening-prayer in catechising; whereat the *parents* and older sort were wont to be present. *Fell.*—All true virtues are to honour true religion as their *parent*, and all well-ordered commonweales to love her as their chiefest stay. *Hooker.*

In vain on the dissembled mother's tongue
Had cunning art and sly persuasion hung;

And

And real care in vain, and native love,
In the true *parent's* panting breast had strove. *Prior.*
As public *parent* of the state,
My justice, and thy crime, requires thy fate. *Dryden.*

THE DUTIES OF PARENTS to legitimate children consist in three particulars; their maintenance, their protection, and their education.

1. The duty of parents to provide for the *maintenance* of their children, is a principle of natural law; an obligation, says Puffendorff, laid on them not only by nature herself, but by their own proper act, in bringing them into the world; for they would be in the highest manner injurious to their issue, if they only gave their children life, that they might afterwards see them perish. By begetting them, therefore, they have entered into a voluntary obligation, to endeavour, as far as in them lies, that the life which they have bestowed shall be supported and preserved. And thus the children will have a perfect right of receiving maintenance from their parents. And the president Montesquieu has a very just observation upon this head, that the establishment of marriage, in all civilized states, is built on this natural obligation of the *father* to provide for his children; for that ascertains and makes known the person who is bound to fulfil this obligation; whereas, in promiscuous and illicit conjunctions, the father is unknown; and the mother finds a thousand obstacles in her way; shame, remorse, the constraint of her sex, and the rigour of laws, that stifle her inclinations to perform this duty; and besides, she generally wants ability.

The municipal laws of all well-regulated states have taken care to enforce this duty; though Providence has done it more effectually than any laws, by implanting in the breast of every parent that natural *φύσις*, or insuperable degree of affection, which not even the deformity of person or mind, not even the wickedness, ingratitude, and rebellion, of children, can totally suppress or extinguish.

The civil law obliges the parent to provide maintenance for his child; and, if he refuse, *juxta de ea re cognoscet*. Nay, it carries this matter so far, that it will not suffer a parent, at his death, totally to disinherit his child, without expressly giving his reason for so doing; and there are fourteen such reasons reckoned up, which may justify such disinherison. If the parent alleged no reason, or a bad or a false one, the child might set the will aside, *tanquam testamentum inofficiosum*, as a testament contrary to the natural duty of the parent.

It is also a principle of law, that there is an obligation on every man to provide for those descended from his loins; and the manner in which this obligation shall be performed, is thus pointed out. The father and mother, grandfather and grandmother, of poor impotent persons, shall maintain them at their own charges, if of sufficient ability, according as the quarter-sessions shall direct; and, if a parent runs away, and leaves his children, the churchwardens and overseers of the parish shall seize his rents, goods, and chattels, and dispose of them towards their relief. By the interpretations which the courts of law have made upon these statutes, if a mother or grandmother marries again, and was before such second marriage of sufficient ability to keep the child, the husband shall be charged to maintain it; for this, being a debt of her's when single, shall, like others, extend to charge the husband. But, at her death, the relation being dissolved, the husband is under no farther obligation.

No person is bound to provide a maintenance for his issue, unless where the children are impotent and unable to work, either through infancy, disease, or accident; and then is only obliged to find them with *necessaries*, the penalty on refusal being no more than 20s. a month. For the policy of our laws, which are ever watchful to promote industry, did not mean to compel a father to maintain his idle and lazy children in ease and indolence; but

thought it unjust to oblige the parent, against his will, to provide them with superfluities, and other indulgencies of fortune; imagining they might trust to the impulse of nature, if the children were deserving of such favours. Yet, as nothing is so apt to stifle the calls of nature as religious bigotry, it is enacted, that if any popish parent shall refuse to allow his protestant child a fitting maintenance, with a view to compel him to change his religion, the lord chancellor shall, by order of court, constrain him to do what is just and reasonable. But this did not extend to persons of another religion of no less bitterness and bigotry than the popish; and therefore, in the very next year, we find an instance of a Jew of immense riches, whose only daughter having embraced Christianity, he turned her out of doors; and, on her application for relief, it was held she was entitled to none. But this gave occasion to another statute, which ordains, that if Jewish parents refuse to allow their protestant children a fitting maintenance, suitable to the fortune of the parent, the lord chancellor, on complaint, may make such order therein as he shall see proper.

Our law has made no provision to prevent the disinheriting of children by will; leaving every man's property in his own disposal, upon a principle of liberty in this as well as every other action; though perhaps it had not been amiss if the parent had been bound to leave them at the least a necessary subsistence. Indeed, among persons of any rank or fortune, a competence is generally provided for younger children, and the bulk of the estate settled upon the eldest, by the marriage-articles. Heirs also, and children, are favourites of our courts of justice, and cannot be disinherited by any dubious or ambiguous words; there being required the utmost certainty of the testator's intentions to take away the right of an heir.

2. From the duty of maintenance we may easily pass to that of *protection*; which is also a natural duty, but rather permitted than enjoined by any municipal laws; nature, in this respect, working so strongly as to need rather a check than a spur. A parent may, by our laws, maintain and uphold his children in their law-suits, without being guilty of the legal crime of maintaining quarrels. A parent may also justify an assault and battery in defence of the persons of his children; nay, where a man's son was beaten by another boy, and the father went near a mile to find him, and there revenged his son's quarrel by beating the other boy, of which beating he afterwards unfortunately died; it was not held to be murder, but manslaughter merely. Such indulgence does the law show to the frailty of human nature, and the workings of parental affection.

3. The last duty of parents to their children is that of giving them an *education* suitable to their station in life: a duty pointed out by reason, and of far the greatest importance of any. For, as Puffendorff very well observes, it is not easy to imagine or allow, that a parent has conferred any considerable benefit upon his child by bringing him into the world, if he afterwards entirely neglects his culture and education, and suffers him to grow up like a mere beast, to lead a life useless to others and shameful to himself. Yet the municipal laws of most countries seem to be defective in this point, by not constraining the parent to bestow a proper education upon his children. Our laws, though their defects in this particular cannot be denied, have in one instance made a wise provision for breeding up the rising generation; since the poor and laborious part of the community, when past the age of nurture, are taken out of the hands of their parents, by the statutes for apprenticing poor children; and are placed out by the public in such a manner as may render their abilities, in their several stations, of the greatest advantage to the commonwealth. (See the article APPRENTICE.) The rich indeed are left at their own option, whether they will breed up their children to be ornaments or disgraces to their family. Yet in one case, that of religion, they are under peculiar restrictions;

tions; for it is provided that, if any person sends any child under his government beyond the seas, either to prevent its good education in England, or in order to enter into, or reside in, any popish college, or to be instructed, persuaded, or strengthened, in the popish religion; in such case, besides the disabilities incurred by the child so sent, the parent or person sending shall forfeit real, which shall go to the sole use and benefit of him that shall discover the offence. And if any parent, or other, shall send or convey any person beyond sea, to enter into, or be resident in, or trained up in, any priory, abbey, nunnery, popish university, college or school, or house of Jesuits or priests, or in any private popish family, in order to be instructed, persuaded, or confirmed, in the popish religion; or shall contribute any thing towards their maintenance when abroad by any pretext whatever; the person both sending and sent shall be disabled to sue in law or equity, or to be executor or administrator to any person, or to enjoy any legacy or deed of gift, or to bear any office in the realm; and shall forfeit all his goods and chattels, and likewise all his real estate for life.

Mr. Walker (Sermons preached at Nottingham) has the following excellent and elegant effusion upon this important part of the duties of parents.

"Many have only narrow and contracted views of the importance of the parental character. They contemplate it only in the interested relation which attaches them to their offspring, and subserving the designs of Providence in obeying the instinct which it has given them; they view not the wide range of public good to which Providence assigns the individual acting of every parent to minister. In a wise education, whether we have it in view or not, we are doing the best service to our country and to human kind. For the ultimate end of all our attention to our children is to fit them for acting their part on the great theatre of the world with credit to themselves, and satisfaction to their fellows; to answer to the demands of every relation in which they may stand; to do the duties of a virtuous citizen, to sustain the honour of human nature. Without some pains to cultivate the minds of the young, to season them with the principles, and practise them in the habits, of wisdom and sound morality, what is to be expected from them but ignorance and profligacy? which, though it may not immediately appear in the form of an unpolished barbarism, yet is capable of greater enormities, of a more unprincipled conduct; and, by dissolving all the bonds by which a well-civilized community is held together, ends at length in the very rudeness and barbarism of our savage ancestors, from which we think ourselves to be the best secured. The selfish dissipation which diffuses itself through a luxurious community, appears as its last character, in the horrid form of indifference to children; and thus every succeeding generation becomes worse than the preceding, till ignorance as well as vice predominates; and then all traces of the manly and Christian character are done away; the love of country, with all its generous train of virtues, appears no more on the active stage; and all the fountains of human happiness, and all the sublimer ends of human life, are annihilated.

"Capacity both for knowledge, virtue, and happiness, is the gift of God; education, habit, and exercise, bring forth this capacity; and constitute all the difference that is found between man and man. However rich the soil, without culture it is luxuriant only in weeds. The inequality which appears so striking in the characters of men, is more owing to education than to any natural difference; at least with respect to moral character, which is the great object that I have in view. I never yet beheld that mind, as it comes from the hand of its Creator, which the management of the parent might not train to virtue, and to usefulness; and even in the view of mere knowledge and wisdom, the difference which education produces is vast and astonishing. It is this which opens and illumines the human mind, which en-

VOL. XVIII. No. 1254.

larges and strengthens all its natural powers; which, setting it, as it were, on a rising ground, gives it the most extensive and commanding view of the world of God, of human life, and of human nature. This unlocks all its secret treasures; brings into exercise all its native force and dormant virtue; and, compared with the untutored and uncivilized mind, exhibits it like a god. In fine, it is education that works so many wonders in man; that polishes our manners, stamps a worth and dignity on our views, forms to wise and good conduct, leads to happiness, and constitutes the grand difference in the human species. The wild Indian, the rude Tartar, and the gross African, have the same erect gait, the same commodious form, the same senses, and most probably the same capacities of mind, with the exalted European; but how low in the scale of humanity has the want of instruction and institution placed them? In every thing which is the true glory of man, in the useful and elegant arts of life, in the protecting forms of civil polity, in the intercourses of social life, in the higher walks of virtue and religion, they appear not as creatures of the same species; we hardly own them as fellows. If then you wish your children to come forward into life in the higher style of human nature; to be, in all grace and dignity and usefulness of character, the European, the Briton, the Christian; to pass from a life of honour here to a life of exalted reward hereafter; be all the parent to them, in instruction, discipline, example; and, as you have not betrayed the most glorious trust which the Creator can confide into your hands, you may go into the presence of your Lord, and wait his audit, with the virtuous hope of his approbation: *Well done! good and faithful servant; thou hast been faithful over the charge which I committed to thy care: enter thou into the joy of thy Lord.*"

The RIGHTS of PARENTS, or their power over their children, result from their duties; this authority being given them, partly to enable them more effectually to perform their duty, and partly as a recompense for their care and trouble in the faithful discharge of it. And upon this score the municipal laws of some nations have given a much larger authority to the parents than others. The ancient Roman laws gave the father a power of life and death over his children; upon this principle, that he who gave had also the power of taking away. But the rigour of these laws was softened by subsequent constitutions; so that we find a father banished by the emperor Hadrian for killing his son, as though he had committed a very heinous crime; upon this maxim, that *Pater potestas in pietate debet, non in atrocitate, consistere*. But still they maintained to the last a very large and absolute authority: for a son could not acquire any property of his own during the life of his father; but all his acquisitions belonged to the father, or at least the profits of them for his life.

The power of a parent by the English law is much more moderate; but still sufficient to keep the child in order and obedience. He may lawfully correct his child, being under age, in a reasonable manner: for this is for the benefit of his education. The consent or concurrence of the parent to the marriage of his child under age, was also directed by our ancient law to be obtained; but now it is absolutely necessary, for without it the contract is void. And this also is another means which the law has put into the parent's hands, in order the better to discharge his duty; first, of protecting his children from the snares of artful and designing persons; and next of settling them properly in life, by preventing the ill consequences of too early and precipitate marriages. A father has no other power over his son's estate than as his trustee or guardian; for, though he may receive the profits during the child's minority, yet he must account for them when he comes of age. He may indeed have the benefit of his children's labour while they live with him, and are maintained by him; but this is no more than he is entitled to from his apprentices or servants. The legal

5 R

power

power of a father (for a *mother*, as such, is entitled to no power, but only to reverence and respect); the power of a father, we say, over the persons of his children, ceases at the age of twenty-one; for they are then enfranchised by arriving at years of discretion, or that point which the law has established (as some must necessarily be established) when the empire of the father, or other guardian, gives place to the empire of reason. Yet, till that age arrives, this empire of the father continues even after his death; for he may by his will appoint a guardian to his children. He may also delegate part of his parental authority, during his life, to the tutor or schoolmaster of his child; who is then *in loco parentis*, and has such a portion of the power of the parent committed to his charge, viz. that of restraint and correction, as may be necessary to answer the purposes for which he is employed.

With respect to the power of parents and the duty of children, much may be said. There are, however, scarcely any instances where both are oftener abused than with respect to marriage. This, as it is the most important event in the civil life either of a man or woman, so it is often rendered peculiarly unfortunate, by precipitate folly and want of duty in children; and as often through the unreasonable severity of parents. As a child is bound not to give unreasonable offence to a parent in the choice of a partner; so neither ought the parent to impose any improper or arbitrary restraint upon the child.

The power of a parent in China is very great; for a father, while living, has the power of an absolute despotic tyrant, and after his death is worshipped as a god. Let a son become ever so rich, and a father ever so poor, there is no submission, no point of obedience, that the latter cannot command, or that the former can refuse. The father is absolute master, not only of his son's estate, but also of his concubines and children, who, whenever they displease him, he may sell to strangers. If a father accuses his son before a mandarin, there needs no proof of his guilt; for they cannot believe that any father can be so unnatural as to bring a false accusation against his own son. But, should a son be so insolent as to mock his father, or arrive at such a pitch of wickedness as to strike him, all the province where this shameful act of violence is committed is alarmed; it even becomes the concern of the whole empire; the emperor himself judges the criminal. All the mandarins near the place are turned out of their posts, especially those of the town where he lived, for having been so negligent in their instructions; and all the neighbours are reprimanded for neglecting, by former punishments, to put a stop to the wickedness of the criminal before it arrived at such flagitiousness. As to the unhappy wretch himself, they cut him into a thousand pieces, burn his bones, level his house to the ground, and even those houses that stand near it, and set up monuments and memorials of the horrid deed. See the article CHINA, vol. iv. p. 452.

The emperor of China, who is one of the most powerful and despotic monarchs upon earth, pays the greatest attention to his mother. An instance of this Pere Amyot relates as having happened at Pekin, A.D. 1752, when the emperor's mother entered her 60th year, which, among the Chinese, is accounted a very remarkable period. Groser likewise particularly describes the homage the emperor pays his mother every new-year's day in the palace, at which ceremony all the great officers of his court assist.

In the Gentleman's Magazine for 1750, we have the following case of conscience. "A person has his own parents and his own children living, both parties equally indigent, both equally incapable of assisting themselves, and both equally earnest in calling upon him for relief. Things are so circumstanced that he can possibly assist but one party, and not both. *Query*, Which party has the greatest claim to his assistance, and to which is he obliged, by all ties human and divine, to give the preference?"

One solves this difficulty, by informing us of a pretty print done at Rome, representing a young woman suckling her aged father, on which the following lines are quoted:

My child and father vital nurture crave,
Parental, filial, fondness both would save;
But, if a nurdling only one can live,
I choose to save the life I cannot give.

Here we find the preference given to the parent; and another correspondent gives the same decision in these words: "The obligations arising from nature and natural affection, seem to be in this case reciprocal and equipollent; the child is as strongly attracted to the parent, as the parent to the child. But, will not filial gratitude operate and decide in favour of the parent? Does not the person, either mediately or immediately, owe his present power and abilities to relieve, to his parent? and are not they on that account best entitled to relief? Does not the fifth commandment declare more strongly in favour of the parents, than any other divine precept does in favour of the children? If a person had an opportunity given him of delivering either his parent or his child (but not both) from certain death, I dare say the voice of nature and of mankind would applaud him that saved his parent, and condemn him that should prefer his child. There is more of selfishness in preferring the child; and to save the parent seems to me to be much the more generous, noble, and exalted, conduct. It is indeed, upon the whole, a melancholy alternative; but, if both parties continue importunate, and neither will relinquish their claims in favour of the other, I say relieve the parent."

There are two correspondents, however, who think differently, and their reasons are as follow: "A person's children have the greatest claim to his assistance; and he is obliged by all ties to prefer them, in that respect, to his parents. It is true, when a man's parents are in want, they have a claim to his assistance; but that claim is not equal to that which his children have. His parents he has of necessity: his children, of choice. It is his duty, before he beget children, to consider how he is to provide for them; and, by being wilfully the cause of their existence, he comes under such an obligation to provide for their comfortable subsistence, as must be stronger than any obligation of that kind he can be under to persons with whom his connexion is involuntary. But nature and reason point it out as the duty of all parents to provide for their children; but not *vice versa*. If a man's parents happen to be indigent, and he himself able, he is bound to maintain them out of respect and gratitude; but his obligation to provide for his children is a debt of strict justice; and therefore ought to be preferred." "I find (says the author of the last answer) that all your correspondents agree, that the life of the parent is to be preserved. It is very certain, that the relation between me and my child is exactly equal to that which is between me and my parent; and therefore relation cannot decide in favour of the one or the other: I must then be determined by a different consideration; and I know of none more weighty than the following. If I preserve the life of my child, I am instrumental in giving life to all his descendants, which may, perhaps, be very numerous; but if I preserve the life of my parent, I preserve a single life only, and that a short one. I therefore say, *Relieve the child*. But it is thought that the voice of nature will applaud the person who preserves the parent: if so, nature must applaud a rule which she herself does not observe: it is natural for old men to die before young ones. Besides, the command, *Be fruitful and multiply, and replenish the earth*, may be opposed to the fifth commandment."

It is hoped that such conflicting cases seldom, if ever, occur; but our own opinion is with the last set of reasoners: we certainly think that a person, particularly if a mother, is bound to prefer the child to the parent. We hope

hope that none of our readers will ever be in the painful situation of being obliged to decide.

PARENT, a town of Prussia, in Pomerelia: ten miles north of Marienburg.

PARENT (Anthony), a respectable French mathematician, was born at Paris in 1666. He was adopted, when only three years of age, by a maternal uncle, the curé of Leves near Chartres, who was a worthy divine and able naturalist, and undertook himself to educate his nephew in the elements of learning. Under his instructions young Parent was well grounded in the principles of piety, to which he continued steadily attached through life; and he was encouraged and assisted in the early propensity which he discovered to the study of the mathematics. Such books in this science as fell in his way, he perused with great eagerness; and it was his custom, as he read them, to write remarks in the margins. Pursuing this practice, when he was only thirteen years of age, he had filled a number of books with a kind of commentary, which excited no little surprise in able masters. At the age of fourteen, he was sent to board with a tutor in rhetoric at Chartres; and, while he was pursuing this course, he accidentally met with a dodecaedron, upon every face of which was delineated a fun-dial, excepting the lowest, upon which it stood. Struck as it were instantaneously with the curiosity of these dials, he attempted to draw one himself; but, as he possessed a book which taught only the practical part, without the theory, it was not till after his master had explained to him the doctrine of the sphere, that he was able to understand how the projection of the circles of the sphere formed fun-dials. He now undertook to write a treatise "upon Gnomonics;" which, it must be acknowledged, was rude and unpolished enough. However, imperfect as it was, it had the merit of being his own invention; as was, likewise, a book "on Geometry," in the same taste, which he wrote about the same time at Beauvais.

When he had finished his course of rhetoric, his relations sent for him to Paris, with a view to his studying the law, which had been his father's profession. Out of compliance with their wishes, he went through a course in that faculty; but no sooner was it completed, than he betook himself, with increased ardour, to those pursuits which accorded best with his genius and inclination. That he might meet with no interruption in his favourite studies, he shut himself up in the college of Dormans, where, with good books, and an income of not more than two hundred livres, he lived contented, seldom stirring from his retreat but when he went to the college-royal, to attend the lectures of M. de la Hire, or M. Sauveur. As soon as he thought himself capable of teaching others, he took pupils; and, fortification being a branch of study which the war had brought into particular notice, he frequently had occasion to teach that science. After some time, he began to entertain scruples about undertaking to teach a subject of which he had no practical knowledge, and communicated them to M. Sauveur. Upon this, that friend recommended him to the marquis d'Alegré, who fortunately at that time wanted the assistance of an able mathematician, and engaged M. Parent in his suite. With this officer our author made two campaigns, during which he had sufficient opportunities to inform himself respecting the nature of fortified places, approaches, &c. of which he drew a number of plans, though he had never been instructed in the art of drawing.

Upon his return to Paris, M. Parent spent his time in a continual application to the study of natural philosophy, and all the branches of the mathematics, both speculative and practical, to which he added that of anatomy, botany, and chemistry: his genius and indefatigable industry enabling him to surmount the difficulties attendant on the acquisition of any science. In the year 1699, M. Fillau des Billettes, having been admitted a member of the Academy of Sciences at Paris, with the title of their mechanician, nominated M. Parent for his *élève*, or disciple, who

particularly excelled in that branch of mathematics. Soon after his admission into the society, it was discovered, that he directed his attention to all the subjects that came before them, and that he was competent to the investigation of every topic which was recommended to their notice. But this extent of ability and compass of knowledge which he possessed, joined to a natural warmth and impetuosity of temper, excited a spirit of contradiction in him, which he indulged upon all occasions; sometimes to a degree of precipitancy that was highly culpable, and too often but with little regard to decency. It is true, indeed, that some fiery spirits showed the same behaviour towards him, to which he gave the first provocation; and the papers which he brought to the academy were often treated with much severity. To such attacks he laid himself open in his best pieces, by a want of perspicuity and method which greatly detracted from their value, and was the cause why his works never met with a circulation proportioned to the excellence of the matter contained in them. In the year 1716, the king established a new regulation for the academy, by which the class of élèves was suppressed, as it created a distinction that seemed to put too great an inequality between the members. On this occasion M. Parent was made an *adjunct*, or assistant member, of the class of geometry; though he enjoyed this appointment only for a very short time, being cut off by the small-pox in the same year, when he was about the age of fifty. Notwithstanding his contentious and irritable disposition, and a forbidding austerity and roughness of manners by which he was distinguished, he is said to have possessed great goodness of heart; and, though his fortune was very limited, he devoted a considerable share of it to acts of beneficence and charity. Besides leaving many works behind him in manuscript, he published, 3. Elements of Mechanics and natural Philosophy, 1700, 12mo. 4. Mathematical and Physical Researches; a kind of Journal, which first appeared in 1705, in 12mo. and afterwards greatly augmented in 1712, in 3 vols. 4to. 5. A theoretico-practical Treatise on Arithmetic, 1714, 8vo. He was also the author of a multitude of papers in the different French Journals, and, in the volumes of the Memoirs of the Academy of Sciences, from the year 1700 to 1714, several papers in almost every volume, upon a great variety of mathematical subjects. *Fontenelle's Eloge in the Hist. of the Acad. of Sciences. Hutton's Math. Dict.*

PA'RENTAGE, *f.* Extraction; birth; condition with respect to the rank of parents.—We find him not only boasting of his *parentage*, as an Israelite at large, but particularizing his descent from Benjamin. *Atterbury.*

A gentleman of noble *parentage*,
Of fair demeanour, youthful, and nobly allied. *Shakspeare.*

PAREN'TAL, *adj.* Becoming parents; pertaining to parents.—Young ladies, on whom *parental* controul sits heavily, give a man of intrigue room to think, that they want to be parents. *Richardson's Clarissa.*

PARENTA'LIA, *f.* in antiquity, funeral obsequies, or the last duties paid by children to their deceased parents.

PARENTALIA is also used for a sacrifice or solemn service offered annually to the manes of the dead.

PARENTATION, *f.* [from *parento*, Lat.] Something done or said in honour of the dead.—Some other ceremonies were practised, which differed not much from those used in *parentations*. *Potter's Antiq. of Greece.*

Let fortune this new *parentation* make
For hated Carthage's dire spirits' sake;
Let bloody Hannibal, and Punick ghosts,
Of this sad Roman expiation boast. *May's Lucan.*

PAREN'TELA. *De parentela se tollere*, in ancient customs, signified a renunciation of one's kindred and family. This was done in open court, before the judge, and in the presence of twelve men, who made oath, that they

they believed it was done for a just cause. We read of it in the laws of Henry I. After such abjuration, the person was incapable of inheriting any thing from any of his relations, &c.

PARENTHESIS, *f.* [Greek; of *παρὰ*, between, and *εἰς*, position; *q. d.* putting between.] Intercalary words inserted in a discourse, which interrupt the sense or thread, but which seem necessary for the fuller understanding of the subject. The proper characteristic of a parenthesis is, that it may be either taken in, or left out, the sense and grammar remaining entire. In speaking, parentheses are to be pronounced in a different tone; and in writing they are inclosed thus (), to distinguish them from the rest of the discourse. The character itself, whereby they are distinguished, is also called a parenthesis. The long *parenthesis* which so frequently occurs in the old writers, to the great embarrassment and perplexity of their meaning, has fallen much into disuse. It has been remarked that the *parenthesis* occurs in no place of Johnson's writings. Authors have shortened their sentences, which, in some of the best writers of the seventeenth and the beginning of the last century, were extended to an almost immeasurable length; and they have stated their sentiments to much more advantage, by separating their ideas from each other, and expressing them with greater exactness. Whether, however, this circumstance may not argue a want of fertility of ideas, and a tardiness of conception, might be a subject of inquiry; and it must, however, be allowed, that the practice of writing in short sentences has a tendency to give language a disjointed appearance; and detracts from roundness of period, and dignity of composition; but it certainly contributes materially to perspicuity. *Modern Preceptor*.

Thou shalt be seen

(Though with some short *parenthesis* between)
High on the throne of wit.

Dryden.

PARENTHETIC, or **PARENTHETICAL**, *adj.* Pertaining to a parenthesis.—This is a *parenthetical* observation of Moses himself. *Dr. Hales on Deut. xxxii. 31.*—Using parentheses.—If Pope's temper had not led him to personality, the observation of Cleland, (whom he describes as a man of sense and of integrity, and, to be very *parenthetic*, who was the Will Honeycomb of the Spectator's club,) in a letter to him, "that all such writings and discourses as touch no man, will mend no man," might have given the bias to his pen. *Tyler's Rhapsody on Pope*.

PARENTHETICALLY, *adv.* In a parenthesis.—This intelligence is certainly mentioned *parenthetically*. *Bryan's Obs. on Script.*

PARENTICIDE, *f.* [from the Lat. *parens*, a parent, and *caedo*, to kill.] One who murders a parent.

PARENTIS DE BOR'N, a town of France, in the department of the Landes, and chief place of a canton, in the district of Mont-de-Marsan: thirty-three miles north of Tartas. The place contains 1440 souls.

PARENTLESS, *adj.* Deprived of parents:

Thy orphans left poore, *parentless*, alone,
The future time's sad miserie to mone. *Mir. for Mag.*

PAREN'ZA, a seaport town of Istria; the see of a bishop. It is a well-built town, situated on a rock, with a harbour for large vessels: thirty-four miles south of Trieste. Lat. 45. 18. N. lon. 13. 40. E.

PAR'ER, *f.* An instrument to cut away the surface:

A hone and a *parer*, like sole of a boot,
To pare away grass, and to raise up the root. *Tusser.*

PARER'GA, *f.* [Gr. of *παρὰ*, with or beside, and *εργον*, work.] A term sometimes used in architecture, for additions, or appendages, made by way of ornament to a principal work. It is sometimes also used in painting, for little pieces, or compartments, on the sides, or in the corners, of the principal pieces. Hence,

PARER'GY, *f.* Something unimportant; something

done by the by.—Scripture being serious, and commonly omitting such *parergies*, it will be unreasonable to condemn all laughter. *Brown.*

PARE'SIS, *f.* [from *παρεῖμι*, Gr. to relax.] The third division, or species, of palsy, (see p. 303.) but by some confined to a palsy of the bladder, attended either with retention of the urine, or involuntary discharge of it.

PARETO'NIUM, *f.* The name of an earth anciently found on the shores of Egypt, Cyrene, and the island of Crete; and used by the ancients in painting. It had its name either from a part of Egypt near which it was gathered, or from the name of a town in that kingdom where it was usually sold. Vitruvius is of the first opinion, and Volaterrus of the other. Of late we have been taught to think it lost; but it is still common on most of the shores of the islands of the Archipelago, though not observed or regarded; and is truly a very heavy and tough clay, of a fine white colour, found in masses of different sizes, generally as soft as the softer clays within the strata; and, by rolling about on the beach in this state, it gathers up the sand, small shells, and other foulnesses, we always find about it. It is most probable, that there are strata of it fine and pure in the cliffs there, and that the sea washes off masses of them in storms and high tides, which are what we find.

PARE'US (David), whose proper name was *Wengler*, a celebrated German divine of the reformed communion, was born at Francoforte in Silesia, in the year 1548. His father, who was the son of a wealthy peasant, after having him educated at a school in his native town, placed him as an apprentice, at first with an apothecary; and afterwards, at the instigation of an ill-humoured second wife, with a shoemaker. This humble situation did not repress the early inclination which young David had discovered for acquiring learning; and at length his father permitted him to follow the bent of his mind. When he was sixteen years of age, therefore, he was sent to Hirschberg, where there was a college, of which Christopher Schilling, a man of considerable learning, was the principal. It was a prevalent custom in those times, among such students as devoted themselves to literary pursuits, to change their family-names for others taken from the Greek language, carrying with them a similar meaning; and of this custom Schilling was an admirer: he, therefore, persuaded our young scholar to take the name of *Pareus*, formed from the Greek word *παρα*, which signifies "the cheek," as *wange*, whence his family name *Wengler* was formed, does in the German. David had not been settled many months at Hirschberg, before he found means to support his expenses, by undertaking the office of private tutor in the family of an honest citizen; and by the handsome presents which he received from one of the principal inhabitants of the place, for writing some verses on the death of his eldest son, and other poems with the subjects of which that gentleman furnished him. In the mean time, Schilling had not only persuaded his pupil to change his name, but had made a convert of him from Lutheranism; in which he had been educated, to the principles of the reformed church, on the subject of the *real presence*; and he succeeded in the same manner with the rest of his scholars. This change in doctrinal sentiment involved both the master and pupil in no little trouble: the former being expelled from his college, at the instigation of the minister of that place; and the latter running the risk of being disinherited by his exasperated father. With great difficulty, when his father's anger was a little cooled, he obtained his permission to go and finish his studies in the Palatinate; but, so trifling was the sum which his father allowed him for his journey, that he was sometimes reduced to the necessity of begging for subsistence on the road; at length, however, he arrived at Amberg, where the elector-palatine, Frederic III. had appointed his master Schilling principal of a new college which he had founded at that place. Soon afterwards, in 1566, he was sent with ten of his schoolfellows to Heidelberg; and they carried

carried with them such effectual recommendations from their common master, that they were all admitted into the College of Wisdom, of which Zachary Ursinus, professor of divinity, was director.

The university of Heidelberg was at this time in a very flourishing condition, and had able professors in all the faculties; of which circumstance Pareus availed himself with the utmost diligence, and made a distinguished proficiency in his acquaintance with the Latin, Greek, and Hebrew, languages, philosophy, and divinity. In 1571, when he was about twenty-three years of age, he was admitted to the ministry, and sent to officiate at a village called Schlettenbach, where he was commissioned to introduce the protestant reformed religion. Before the end of the year he was recalled to Heidelberg, and appointed to teach the third class of students; in which employment he acquitted himself with such ability, that after the expiration of two years he was promoted to the second class. After holding this situation six months, he resigned it, to become pastor of Hemsbach in the diocese of Worms, and to establish the reformed religion in that place. Soon after his settlement at Hemsbach he entered into the marriage-state; and his nuptials, which were publicly celebrated in 1574, exhibited a novel sight to the parishioners, who had never before seen a clergyman take to himself a wife. In the year 1577, upon the death of the elector Frederic III. his son Louis, who was a zealous Lutheran, established ministers of that communion throughout his dominions, in the room of the reformed; by which measure Pareus lost his living. On this occasion he retired into the territories of prince John Casimir, brother to that elector, and officiated for three years as minister of Ogerheim near Frankenthal. Afterwards he removed to fill the same office at Winzingen near Neustadt. What rendered the neighbourhood of the latter place the more agreeable and advantageous to him was the circumstance, that prince Casimir had founded a *schola illustris* at that place in 1578, and had settled there all the professors who had been expelled from Heidelberg. In 1583, the elector Louis dying, the sole guardianship of his son Frederic IV. and the administration of the palatinate devolved upon prince Casimir; who restored the reformed ministers, and appointed Pareus second professor in the College of Wisdom at Heidelberg, in the year 1584. Two years afterwards he commenced author, by publishing his "*Methodus Ubiquitarum Controversiarum*." In 1589, he published an edition of the German version of the Bible, at Neustadt, with notes; which drew him into a warm controversy with a Lutheran of Tubingen, named James Andreas. In 1591, Pareus was appointed first professor in the College of Wisdom; and in 1592, counsellor of the ecclesiastical senate. These promotions were followed, in 1593, by his admission, in a most solemn manner, to the degree of doctor of divinity.

Pareus engaged in several controversies with the writers of the Augsburg Confession, particularly in 1596, when he undertook the vindication of Calvin, who was charged with favouring Judaism in his exposition of several passages of scripture. Two years afterwards he was nominated to the chair of divinity-professor for the Old Testament at Heidelberg; and in the year 1602, upon the death of Daniel Tostanus, Pareus succeeded him in the chair of divinity-professor for the New Testament. He had now risen into very high reputation, which was so widely diffused, that it induced numerous students to come and attend his lectures at Heidelberg, from the remotest parts of Hungary and Poland. Having purchased a house in the suburbs of that city, in the year 1607, he erected an apartment in the garden, for a library and study, calling it his *Pareanum*; which name was afterwards given by the city to the whole house. On this house the elector bestowed several privileges and immunities, as a reward of the professor's merits. Here he died in June 1622, when he was nearly seventy-four years of age, and was buried with all the funeral honours which the universities of Germany

VOL. XVIII. No. 1255.

are accustomed to bestow on their most distinguished members.

His works consist of "Commentaries" upon several of the books of Scripture, and numerous critical, didactic, polemic, and miscellaneous, pieces, which were collected together, and published at Frankfort in 1647, in four volumes, folio. He gave so much offence to king James I. of England, by some antimonarchical principles which he advanced in his "Commentary on St. Paul's Epistle to the Romans," that his majesty ordered that work to be burnt by the common hangman; and it was condemned in the most disgraceful manner by the university of Oxford. An answer to it was published by Dr. David Owen, chaplain to the earl of Holderness, under the title of "*Antipareus, five Determinatio de Jure Regio habita Cantabrigiæ in Scholis theologicis*, 19 April 1619, contra Davidem Paræum, cæterosque reformatæ Religionis Antimonarchos," 1632, 8vo. to which a reply was written by the subject of the next article.

PARE'US (John-Philip), son of the preceding, was born in 1576 at Hemsbach, in the diocese of Worms. He studied at Neustadt and Heidelberg; and afterwards, at the expense of the elector-palatine, visited several foreign universities, being generally well received on account of his father's reputation. In 1610 he was made rector of the college at Neustadt, where he continued till the town fell into the hands of the Spaniards in 1622, on which occasion his library was plundered. From the number of his publications he ranks among the most laborious of the German critics and grammarians. He was particularly attached to the comedies of Plautus, and had a furious controversy with Gruter on their account. After having been at the head of various colleges, among which was that of Hanau, he died about 1650. Of the works of this author are, 1. *Lexicon Plautinum*, 1614; an useful vocabulary of the words used by Plautus. 2. *Electa Plautina*, 1601. 3. An edition of Plautus with Commentaries, 1619. 4. *Electa Symmachiana*. 5. *Calligraphia Romana*. 6. *Lexicum Criticum*, 1645. He also wrote some commentaries on Scripture, and some works on theology.

DANIEL PAREUS, son of the preceding, was likewise a learned philologist, and published an edition of the poem of Musæus on the Loves of Hero and Leander; Notes on Quintilian and Lucretius; *Medulla Historiæ Ecclesiasticæ*; and other works. *Gen. Biog.*

PAREWA'H, a town of Hindoostan, in Oude: eight miles north of Bahraitch.

PARFA'IT (Francis), was born at Paris in 1698, of a distinguished family; and died in 1753. His works are, 1. A General History of the French Theatre, 15 vols. 2. A History of the ancient Italian Theatre, 2 vols. 3. A Dictionary of Theatres, 7 vols. 4. Several dramatic pieces that were never acted.

PAR'GA, a town of Albania, on the coast of the Adriatic Sea: twenty-five miles west-north-west of Arta.

The concerns of this little state were brought before the British parliament in the course of the year 1819; and few questions of minor importance have been more generally misrepresented and more completely misunderstood than that which relates to the measures adopted by our government in regard to the restoration of Parga to the Sublime Porte. That there should prevail on the part of our countrymen a strong feeling of regret at the necessity of a measure, which made the inhabitants of a little state abandon for ever their native place, is no more than might be looked for from them, in favour of the weak and unfortunate, without any knowledge of the particular merits of the case: but this amiable bias, however laudable in itself, was grossly abused by a strange perversion of circumstances; and that conduct, which ought to have been viewed as an instance of British liberality, humanity, and consideration for the unfortunate, has, with a singular degree of party-spirit, been tortured into a breach of national faith, and a wanton or thoughtless sacrifice of a meritorious people, to whom we were bound by every tie

of justice and humanity. A plain statement, therefore, of the proceedings respecting Parga, collected from officers on the spot, and from such official documents as have been made public, will, we are confident, convince every unprejudiced mind, that a feeling of kindness for the inhabitants of Parga influenced every measure of the British government; and that the same principle invariably guided the conduct of sir Thomas Maitland, on whom devolved the difficult and delicate task of carrying these measures into execution.

The present town of Parga had no existence before the irruption of the Mahometans into Greece, which happened about the end of the fourteenth century, though it is pretended that its name was taken from some former town called *Hypargos*, on account of its dependance on Argos. According to Miletius, *Paleo-Parga*, or Old Parga, contained a greater number of inhabitants than any other in the Thesprotian division of Epirus; but of this, *etiam perire ruinae*. The history of the present Parganotes, Parguinotes, or Pargiotes, as they are called by different writers, can be traced only to the period of the invasion of Greece by Mahomet II. when the inhabitants of this part of the coast and the neighbouring villages fortified themselves, in the strongest position which their country afforded, against the Turks; and, after the immediate danger had passed away, built the town on the rock where the fort now stands, and surrounded it with a wall. This rock juts into the Ionian Sea, opposite the southern end of Corfu, or the northern extremity of Paxo, and is about 240 feet in height; on its summit stands a building which is usually called the citadel. The town consists of one street, and a few narrow lanes; the houses are extremely poor, but have a pretty appearance, from being perched on the sloping side of a hill. The extent of the territory of Parga is about six miles along the coast, and generally about two in depth; the landscape is beautiful, and affords every-where the most picturesque scenery. With the exception of the rock, it may almost be said to consist of one continued olive-grove, interspersed, however, with gardens, orchards of orange and lime trees, and little cottages, which, with here and there a tall cypress towering above the rest, give a lively variety and a pleasing animation to the picture. The sides of the hills are planted with vineyards, and the open spaces produce a little wheat and Indian corn, sufficient for about four months consumption of the population; the remainder of their grain being partly purchased with the little returns of their oil, oranges, &c. from the Adriatic, and partly from the territories of Ali Pasha. The inhabitants justly boast of the purity and salubrity of the water and air of their country.

The state of hostility which has always prevailed between the Parguinotes and the Turks, has rendered them brave, and has familiarized them to arms and dangers. They are temperate, and commonly attain an advanced age. The men are in general strong and robust, rather above the middle size; their costume is that of the Greek Islanders; it consists of an embroidered jacket, large breeches of blue cloth, and the head is covered with a red skull-cap. They wear mustachios, and are generally armed with a musket, a pair of pistols, a dagger, and a sabre. "The women of Parga are generally handsome; their dress is a jacket of cloth or silk, embroidered, or trimmed with gold, with a long plaited petticoat. The hair is intertwined with a double cord of red silk, and gracefully fastened up behind. When they appear in public, they cover the head with a coloured handkerchief, which conceals the antique elegance of this coiffure. The wives and daughters of the principal inhabitants resort daily to procure water for domestic use, to a fountain (St. Trifon), about a mile from the town. They regard this exercise as a recreation, and it would be difficult to make them renounce so favourite a custom. Few sights can be more picturesque than these groups of women, among groves of olive and orange trees, bearing vases of ele-

gant forms on their heads." This is the description of the Chev. de Boffet; but these happy days are now no more.

At the time above mentioned, the Lion of St. Mark defended the coast and islands of the Adriatic and Archipelago; and the Parganotes, to ensure their escape from the bondage of the Turks, placed themselves, in 1401, under the protection of the Venetians, by whose powerful aid they were enabled by degrees to extend their territory to its present boundary. This tract was, at that time, and till very lately, surrounded by hordes of marauders, held under no rule but that of adventitious circumstances, though nominally subject to Turkey. The valour of the Parganotes concurring with the obvious interest of the Venetians to preserve one well-affected ally in that turbulent neighbourhood, bound the latter to a faithful observance of stipulations, which, in other circumstances, they were accustomed to violate with very little scruple. On the 21st day of March, 1401, the treaty of federation, thus singularly fulfilled, was first subscribed and sworn to between the two states. For the protection of the weaker power, it was agreed that the Venetians should maintain a body of Italian or Sclavonian troops within the walls of Parga; but, to prevent the abuse of a power thus dangerously posted, it was solemnly stipulated, that the Pargiots should govern themselves freely and independently, according to the laws and constitutions of their ancestors, and by judges and magistrates of their own election; that they should not be liable to serve by sea or land, in the militia or galleys of Venice, nor to engage in any war but in defence of their own territory and the Venetian settlements in Albania; that they should pay no taxes nor customs on export or import, and be chargeable only with half the ordinary duties when trading to the ports of Venice. This treaty was again confirmed, with the same solemnities, in August 1447; and observed, to the mutual satisfaction of both parties, till the end of that century. In 1500, in spite of the Venetian assistance, the city was burned by the Turks; and again in 1560. On this last occasion, the inhabitants were massacred or dispersed, and the whole territory laid waste and desolate. The scattered remnant of its people took shelter among the wandering tribes of the neighbouring mountains, but, by little and little, ventured back to their ancient possessions; and, after several years, came at length to rebuild their houses and temples on the spot where their ancestors had fallen. They then sent deputies to Venice to demand their assistance, and the renewal of their ancient alliance; requesting, among other things, that the senate would assist in fortifying their city, and would also lend them a sum of money to enable the poorer part of the citizens to rebuild their habitations. The senate was not only just, but generous. It undertook the whole expense of erecting the fortifications; and, instead of a loan from its treasury, it sent, as a free gift, the requisite materials for the construction of their houses. When the particular points of the embassy were adjusted, a new charter, ratifying and confirming all the former treaties, was regularly signed on the 5th of February, 1571. It was afterwards repeatedly renewed, and was always religiously fulfilled, not only in its letter, but its spirit, till the final extinction of Venice by the ambition of France and Austria in 1797.

At that time the French, after breaking up the Venetian republic, took possession of the Ionian Islands, and, at the same time, of Parga, and four other fortified stations in its neighbourhood; namely, Butrinto, Gomenitza, Vonitza, and Previsa. Parga was situated in the middle of these four places, and was, as it were, the keystone of the whole range. In the following year, when a coalition was formed against France by England, Russia, and the Ottoman Porte, the Ionian Islands surrendered to the allied fleets of Russia and Turkey; and Butrinto, Vonitza, and Previsa, fell into the hands of Ali Pasha, who is said to have committed dreadful slaughter on the

French, and on those Greeks and Albanians who had taken up arms, and joined the enemies of the Porte. Parga, however, supported by a French garrison, held out against the pasha, until the inhabitants found an opportunity of throwing themselves into the power of the Russians, who sent a garrison for their protection.

In 1800 a treaty was concluded at Constantinople between Russia and the Sublime Porte, by which the Seven Islands were erected into an independent republic, under the sovereign protection of Russia; and Butrinto, Parga, Previsa, and Vonitza, were ceded to the Porte in sovereignty for ever, on certain conditions favourable to these four places, and guaranteed to them by Russia. In consequence of this treaty, Abdullah Bey was sent from Constantinople to govern them, and Previsa was immediately evacuated by Ali Pasha. The Parganotes, however, stubbornly refused submission to the Ottoman power until the end of 1800, when, by the persuasion of the Russian ambassador at the Ionian Islands, they consented to receive the bey, and continued, in quiet possession of all their privileges, under the Turkish dominion, for nearly six years.

In 1806 the war broke out between Russia and the Porte; and Veli Pasha, the son of Ali, seized upon Previsa, Vonitza, and Butrinto, by express orders from the Porte; confiscated the possessions of the Russians; planted there several Ottoman families; and drove the Christian inhabitants into the interior. Parga, however, again escaped by calling from Corfu a Russian force for its protection; and when, by the treaty of Tilsit, in 1807, the Ionian Islands were delivered up to France, and Berthier was sent as the governor-general of Corfu, he threw into the place a garrison of three hundred Frenchmen. Ali Pasha, however, having information that the secret instructions of Berthier directed him to occupy the Ionian Islands *alone*, dispatched his effendi to Corfu, to insist on the French troops being withdrawn from Parga; and the general, satisfied of the justice of his demand, informed the Parganotes that he was about to cede the place to the Turkish government, to whom of right it belonged. Had this determination been carried into effect, the Parganotes were aware that they had little mercy to expect. The primates therefore repaired in a body to Corfu, and, throwing themselves at the general's feet, implored his compassion for their unfortunate countrymen, and besought him not to surrender them to certain destruction. Overcome by their earnest intreaties, the general recalled his orders, and permitted the garrison to remain for the protection of the place, which the French continued to hold as an appendage to the Ionian Islands.

In 1814 the star of Napoleon was visibly declining; and Ali, whom the circumstance did not escape, marched an army to the confines of Parga, and took possession of Aja, a village within the limits. In the month of March, when all the Ionian Islands had fallen into the possession of the English, except Corfu, between which and Parga (still in possession of the French) all intercourse had become not only difficult but nearly impracticable; and when the relief of the former place by French reinforcements was rendered almost impossible by the closeness of the blockade; the Parganotes, apprehensive that it was the intention of the French to deliver the fortrefs to Ali, (who, as we mentioned above, had taken possession of Aja,) sent a deputation to the English commandant of the island of Paxo, requesting the assistance of the British troops, and promising to give up the fortrefs to them. The officer in command refused to send a force to take possession of it, until a written declaration was brought from the principal inhabitants, to show there was no treachery. Two frigates, the *Bacchante* and the *Havannah*, then took on-board a detachment of troops to form the garrison; and, on their landing with a party of marines, the French made little or no resistance; and the British troops occupied Parga. But no stipulations whatever were entered into by, or in behalf of, the British go-

vernment, with the Parganotes; no other promises made, no other assurances given, than such as held out to them generally a continuance of security and protection so long as the British flag should fly on their fort; and so far was Gen. Campbell from accepting the offer "to follow the fate of the Seven Islands," with which they concluded their declaration, or from giving any encouragement to the deputation of primates, who subsequently went to Corfu to implore him "that the fate of Parga might be united for ever to that of the Ionian Islands," that he told them in plain terms, (as Sir James Gordon had done before him,) that he could accede to no such condition; but that they might rely on the protection of the British flag, until their fate should be decided at a general peace. It is indeed perfectly obvious that no stipulation of this kind could be made; for Corfu was, at the time, in full possession of France; and no man would or could, under those circumstances, have been absurd enough to determine by implication that the revival of the Septinsular Republic would form a part of the ultimate arrangements of the allied powers.

General Sir James Campbell reported to his government the step which he had taken, and in which he had been guided by the double motive of humanity and policy; of saving these unfortunate people from an unconditional surrender to Ali, and of obtaining a temporary possession of a spot which might assist in the effectual blockade of Corfu. The British government approved of his conduct; and directed him to continue to hold Parga provisionally in possession, as he already did several of the Ionian Islands, "until their final destination should be arranged at the conclusion of a general peace."

At the Congress of Vienna, and at Paris in 1815, the governments of Russia, Austria, and Prussia, after much deliberation, offered to Great Britain the sovereign protection of the Ionian Republic; and in November of the same year, a treaty was signed, by which the Ionian Islands and their dependencies, as described in the treaty of 1800 between Russia and the Ottoman Porte, were placed under the protection of England. By this treaty of 1800, the continental possessions of Parga, Previsa, Vonitza, and Butrinto, were restored in full sovereignty to the Porte, and were no longer to form a part of the Ionian Republic, then placed under the sovereignty of Russia. In reference to it, the islands of Corfu, Cephalonia, Zante, Santa Maura, Ithaca, Cerigo, and Paxo, with their dependencies, (but to the exclusion by name of the four places above mentioned,) were erected into a free and independent state, under the immediate protection of Great Britain. In the discussion that took place, the treaty of 1800, which had been renewed and confirmed in 1812 by that of Bucharest, between Russia and the Porte, made it incumbent on the allied powers to respect the territorial rights of the Porte to the continental possessions of the late Venetian Republic; and they were excluded from the Septinsular Republic, of which, in fact, they had never constituted a part. Thus, when Great Britain was called, in 1815, to the protection of the Ionian Republic, Parga formed no part of that Republic. Parga, of course, followed the fate of the other three ex-Venetian states, and became, like them, united to the Turkish empire.

It does not follow that, because, in the treaty of Great Britain with the other powers of Europe in 1815, a reference is made to the treaty between Russia and the Porte of 1800, for the purpose (and for no other) of determining the limits of the Ionian Republic, and because Parga had fallen by other means, and by the seeking of the inhabitants, with a view to their own safety, into her provisional occupation; it does not therefore follow, we say, that Great Britain was bound in the most distant manner to interfere, or to see that the conditions which had been stipulated by the Porte with Russia, and which are detailed in the treaty of 1800, should be fulfilled towards the Parganotes. There is no article in the British treaty

treaty of 1815 which confirms, or by which she takes upon herself, the conditions of 1800; they were perfectly foreign to her; they could not have been listened to for a moment; and that treaty was referred to, as we said before, merely as the means of defining the limits of the new territory to be placed under her protection. As far, therefore, as treaties, or engagements, or promises, are concerned, Great Britain might have withdrawn her troops from Parga, and left it open at any time she pleased to the re-occupation of the Ottoman Porte. This would have been, in fact, to deliver over the Parganotes to the unlimited fury of Ali Pasha, in whose territories they are situated, and who was already sufficiently irritated by their repeated refusals to surrender themselves to him.

To avoid a catastrophe so dreadful, the British ambassador was authorized to announce to the Porte, that the British garrison would be withdrawn from Parga so soon as the sultan should give his accession to the new settlement of the Ionian Islands, which circumstances, arising out of the war with France, had compelled the allied sovereigns to determine upon; but not until he had further consented to provide a suitable indemnity for such of the Parganotes as might resolve, from motives of personal security, to remove. But those inhabitants of Parga who might be disposed to remain, were equally the objects of British solicitude. As the treaty was still in force between Russia and the Porte, (which the special conditions thus obtained in favour of such of the Parganotes as chose to withdraw could not be considered as abrogating in any respect,) it was considered that the rights to be claimed under that treaty, by those who should stay behind, ought to be secured to them by the Ottoman Porte. To those rights they were clearly and unequivocally entitled, and to all the privileges thereby granted to them; and it was competent for Russia, at any time, to claim the same for them. The British government, however, not being a direct party to the treaty of 1800, had no such right of interference; she might endeavour to prevail on the Porte to grant them, without being considered as bound by any obligation to watch over their fulfilment: and this step she appears to have taken. Having succeeded Russia in the character of protector of the Ionian Islands, and the immediate countenance of a Russian force being thus lost to the Parganotes, his majesty's minister at the Congress, instead of being ignorant of the state of Parga, or forgetful of the Parganotes, as has been insinuated, appears to have taken the deepest interest in the security of this little community: this is fully proved by the instructions given to the ambassador at Constantinople, to employ his good offices, in concert with the Russian minister, if necessary, to secure to those who might remain all the privileges to which they were solemnly entitled by the treaty in question.

As soon as the negotiations for giving up Parga were concluded at Constantinople, the sultan appointed Hadji Khan Hamed Bey his commissioner to take possession of the place, and at the same time to deliver his accession to the treaty relative to the Ionian Islands. To meet this commissioner, and to arrange matters respecting the valuation of the property, Gen. Maitland nominated Mr. Cartwright, (then British consul at Patras, and now consul-general at Constantinople,) as a person who, from his habits of business and his official situation, appeared to be the best qualified for the delicate and difficult task of steering between two conflicting and dissatisfied parties. Mr. Cartwright proceeded to Ioannina, whence Hamed Bey has written to announce his arrival. To give confidence to the Parganotes, on the approach of the commissioners, the commander-in-chief of the Ionian Islands thought fit to reinforce the garrison to three hundred men.

The persons appointed by the general to make the valuation on the part of the Parganotes were four gentlemen of respectability on the island of Corfu. With singular care, and after long and continued labour, they took an accurate schedule of the property of every individual

within the territory, on which they put the same value that a similar property would be worth on that island. They found the number of houses and cottages to amount to 852; and the number of inhabitants, men, women, and children, to 2700, of which 200 were Albanians; the number of olive-trees was 80,447; of wild olives, 9,486; of orange and citron trees, 23,082; of other fruit trees, 13,012; and of Valonia oaks, 513; besides vineyards and cultivable grounds, all of which were measured. The value of this property, which the Parganotes themselves had stated at 500,000*l.* was estimated by the Corfu commissioners at 280,000*l.* but by those on the part of the sultan at 56,756*l.* only. Here then the two parties were at issue, though not so much as might appear at first sight; the Corfu commissioners having fixed the value as if the property had been at Corfu, and without any deduction for prompt cash-payment; the first of which, it seems, admits of an abatement of one-third part by the rule in force even under the Venetian government, and the latter of one-fourth. These deductions therefore would reduce their valuation to about 140,000*l.* Still, however, the difference was so great between the two valuations as to leave little hopes of coming to any speedy adjustment; but the perseverance of sir Thomas Maitland finally succeeded in obtaining for the Parganotes 150,000*l.* (666,000 dollars,) nearly three times the sum estimated by the officers of the Porte. But here again a difficulty occurred. Hamed Bey had provided the payment in Turkish piastres, a miserably debased coin. Had these been accepted, this vast sum carried into the Ionian Islands, would at once have so depreciated the value, as to cause a very considerable loss to the Parganotes, and detriment to the money-circulation of the Ionian Republic. The voluntary liberality of Hamed Bey, however, smoothed this point of difficulty; and at the expense of 33,000 dollars he procured Spanish and Imperial dollars to the whole amount.

The moment this indemnity was received, the result was publicly proclaimed in specific terms; every inhabitant was explicitly informed of the sum he was to receive, of the amount of the valuation originally made of his respective property, and the diminution in consequence of the subsequent arrangements; and every one was again distinctly told that it was entirely at his own option either to remove or stay. To prevent any mistake, each received a ticket, stating the amount of his individual share; and the result of the whole proceeding was, that, instead of making any objections to the fairness of the valuation, the Parganotes all expressed their satisfaction at what had been done for them, in the strongest and most unequivocal manner. We should have added that, on the delivery of the tickets, each individual was again informed, that he was still perfectly at liberty to remain, or to accept what had been considered as a fair equivalent for the property which he was about to leave. Hamed Bey made known by public proclamation the sentiments of the Porte on this occasion. "I engage," says he, "on behalf of the Sublime Porte, that all those who, from attachment to their beloved country, may remain behind, shall enjoy liberty of every kind, and every thing which regards their religion, without hindrance or molestation, together with every security, and the most profound tranquillity, in all that concerns their condition, their honour, and the respect due to each." They had all, however, made up their minds to quit the place, except one family; and they quitted it accordingly: one of the primates returned the following day, and was kindly received by Hamed Bey, and also by Ali Pasha, who visited the place three days after its evacuation.

On the arrival of the Parganotes at Corfu, it was settled with the Ionian government, that they should be at once, by an act of the legislature, acknowledged as naturalized subjects, and indulged in their anxious wish "to follow the fate of the Ionian Islands;" giving them, at the same time, permission to settle in any of them, without the least restriction

restriction on their free agency, other than the obligation imposed on each individual, that, having once made his choice, he should declare it to the local government of that island on which he had resolved to reside. Every disposition was manifested on the part of the general (now lord high commissioner) to make the situation of the Parganotes comfortable. He offered them lands; to build them a church, a market-place, a court-house, and such other public buildings as might be necessary; to grant the lands on one spot, if they chose it, on which they might erect a *Parga Nova*; and he endeavoured, by many other kind offices, to convince them of the interest which his majesty's government had invariably felt for their present comfort, and their ultimate and permanent advantage. The large sums of money, which many of the families had received, enabled them to enter on a more extensive scale of trade than they had hitherto been able to exercise while cooped up in Parga: some fixed themselves in small shops; others had recourse to the carrying-trade and to fishing; and few or no complaints were heard among them till they came to know, that sir Charles Monck and some other British senators had stated that they were very badly used.

We need hardly observe, that, however satisfied people in their situation might be, it would be too much to expect they should remain so, or continue to think themselves well treated, when they found persons of distinction in the parliament of Great Britain roundly asserting the contrary, and not only deprecating their lot, but wantonly abusing the government for its cruelty and injustice towards them. Without affecting the piling cant of humanity, (so fashionable at the present day,) we can feel what it is for a whole people to abandon a spot to which they had long been rivetted by habit, by affection, by the recollection of pleasures and enjoyments of which they are called upon for ever to take leave; to fly from a country endeared by those early ties and numerous associations which every hill and rock and rivulet has power to awaken; and to leave behind those roofs which have been the scene of the strongest passions which agitate the human mind. There, in truth, are no slight evils; but, when imperious necessity demands the sacrifice, and when every possible assistance is given to alleviate the loss, and to ward off the greater calamity, generosity as well as justice should prevent them from calumniating their benefactors. In justice to the Parganotes, however, it must be added that they were at least resigned to their fate, until they learned the clamour that was raised in their behalf.

At any rate, the degree of compassion which has been excited for the Parganotes is extravagant. If we compare the full and prompt indemnity procured for them, with the slow and scanty pittance granted to that numerous body of American loyalists, to whom we were pledged by every tie that ancient connection and recent devotion and attachment could enforce, we shall find that the balance, we will not say of justice, but of liberality, will preponderate considerably in favour of the former. What indemnification was granted, we would ask, or what stipulations were made, in favour of the great proprietors of any of the French West-India islands ceded at the treaty of Amiens? In what way did we interfere to secure either the persons or properties of the numerous French landholders who adhered to their sovereign or his cause from the tyranny of Bonaparte? But, leaving this, we would gladly learn in what treaty, for a cession of territory, made by any of the powers of Europe, was any other favourable condition ever granted to the inhabitants of that territory, except that of "settling a term, within which those who either belonged to it or were attached to the power who ceded it, should have a right to dispose of their property in the best manner they were able." Parga alone offers an honourable exemption from this rule; and the paying to the inhabitants the absolute value of the property which they voluntarily relinquished, within the short space of four months, in which all their litigations, conflicting titles,

and numerous claims of great variety and complexity, were adjusted, does no less credit to the active and impartial interference of the British government, than to its disinterested consideration for those who confided in its justice and power. And sir Tho. Maitland, the lord high commissioner, or governor, of the Ionian Isles, on opening the legislative session at Corfu, Apr. 8, 1820, observed, "The cession of Parga took place by virtue of treaties to which England has ever been faithful; she had moreover indemnified the Parguinotes, and granted them the rights of citizenship in the Ionian Isles." Several publications have appeared on the subject: our account is taken chiefly from the Quarterly Review, N^o XLV.

PARGAMA'R. See PERGAMAR.

PAR'GAS, a small island in the gulf of Finland, near the coast of Sweden, with a town: Lat. 60. 19. N. lon. 22. 7. E.

PAR'GASITE, *f.* A new mineral recently discovered at the village of Ersby, near Abo, in Finland. It is of a green colour, translucent and transparent. Its crystals are of various sizes, from an inch downward; the form an octohedron, with a rhomboidal base. It is harder than fluor spar, scratches glass, but is scratched by quartz. Specific gravity, 3.11. It melts before the blow-pipe into a mass of a pearly white lustre. The following are given as the proportions of its constituents:

Silex	-	-	42.01
Magnesia	-	-	18.27
Lime and alumina, equal parts			28.36
Oxyds of iron and manganese			4.54
Oxyd of a metal not investigated			0.33
Fluoric acid, water, and loss			5.68
			100.00

PAR'GET, *f.* [perhaps from *paries*, Lat. a wall; having been at first written *pariet*. See Bp. Hall in *To PAR'GET*.] Plaster laid upon roofs of rooms.—Of English tale, the coarser sort is called plaster or *parget*: the finer spæad. *Woodward*.

Gold was the *parget*; and the cieling bright
Did shine all scaly with great plates of gold;
The floor of jasp and emerald was dight. *Spenser*.

Paint.—Scorn'd paintings, *pargit*, and the borrow'd hair.
Drayton.

To PAR'GET, *v. a.* To plaster; to cover with plaster.—If he have bestowed but a little sum in glazing, paving, *parieting*, of God's house, you shall find it in the church-window. *Bp. Hall's Characters*.—A plaster that rather resembles true stone than mortar; with which they not only *parget* the outside of their houses, and trim it with paint after the Morisco manner; but also spread the floors and arches of their room. *Sir T. Herbert's Trav.*—There are not more arts of disguising our corporal blemishes than our moral; and yet, whilst we thus paint and *parget* our own deformities, we cannot allow any the least imperfection of another's to remain undetected. *Gov. of the Tongue*.

To PAR'GET, *v. n.* To lay paint on the face.—She's above fifty too, and *pargets*! *B. Jonson's Epicæne*.

PAR'GETER, *f.* A plasterer. *Barret*.

PAR'GETING, *f.* in building, is used for the plastering of walls; sometimes for the plaster itself.—Pargetting is of various kinds: as, 1. White lime-and-hair mortar laid on bare walls. 2. On bare laths, as in partitioning, and plain cieling. 3. Rendering the insides of walls, or doubling partition-walls. 4. Rough-casting on hearth-laths. 5. Plastering on brick-work, with finishing-mortar, in imitation of stone-work; and the like upon hearth-laths. *Chambers*.

PARGOIRE (St.), a town of France, in the department of the Herault: fourteen miles south-south-east of Lodeve.

PARGO'W, a town of Hindoostan, in the circar of Gohud: nine miles south-south-west of Kooch.

PAR'HAM, a town of the island of Antigua: five miles west of St. John's.

PARHELION, *f.* [Greek; formed of *παρά*, near, and *ἥλιος*, sun.] A mock-sun, or meteor, being a part of the heavens strongly illuminated by the image of the sun, and appearing like another sun, but often coloured and drawn out to a considerable length, in the form of a tail.—To neglect that supreme resplendency, that shines in God, for these dim representations of it that we so doat on in the creature, is as absurd, as it were for a Persian to offer his sacrifice to a *parhelion*, instead of adoring the sun. *Boyle.*

The apparent size of parhelia is the same as that of the true sun; but they are not always round, nor always so bright as the sun; and, when several appear, some are more bright than others. They are tinged externally with colours like the rainbow, and many of them have a long fiery tail opposite to the sun, but paler towards the extremity. Some parhelia have been observed with two, and others with three, tails. These tails appear for the most part in a white horizontal circle, which generally passes through all the parhelia; and, if it were entire, would go through the centre of the sun. Sometimes there are arcs of smaller circles, concentric to this, touching those coloured circles which surround the sun. They are also tinged with colours, and contain other parhelia. Parhelia are generally situated in the intersections of circles; but Cassini says, that those which he saw in 1683 were on the outside of the coloured circle, though the tails were in the circle that was parallel to the horizon. *Æpinus* apprehends that parhelia with elliptical coronæ are more frequent in the northern regions and those with circular ones in the southern. They have been visible for one, two, three, and four, hours together; and in North America they are said to continue some days, and to be visible from sun-rise to sun-set. When the parhelia disappear, it sometimes rains, or there falls snow in the form of oblong spiculæ, as *Maraldi*, *Weidler*, *Krafft*, and others, have observed; and, because the air in North America abounds with such frozen spiculæ, which are even visible to the eye, according to *Ellis* and *Middleton*, such particles have been thought to be the cause of all coronæ and parhelia.

Aristotle observes, that two were seen in the Bosphorus from morning to evening, though, in general, he observes, they are not seen except when the sun is near the horizon. *Pliny* relates under what consuls this phenomenon was ever seen at Rome. In the year 1629, was seen at Rome, by *Scheiner*, a parhelion of four suns; and the same number was seen by *M. Muschenbroeck* at Utrecht. *Gassendi* says, that in 1635 and 1636 he often saw one mock sun; in 1661, *Hevelius* observed at Dantzic one of seven suns; and in 1666, another was seen at Arles, of six. Phenomena of this kind have also been observed by *M. de la Hire* at Paris in 1689, and by *M. Cassini* in 1693; by *Mr. Grey* in 1700; by *Halley* in 1702; and by *Maraldi* in 1721.

Aristotle (*Meteor. cap. 3.*) was of opinion, that rainbows, halos, and mock suns, were all occasioned by the reflection of the sun-beams in different circumstances, by which an imperfect image of his body was produced, the colour only being exhibited, and not his proper figure. The image, he says, is not single, as in a mirror; for each drop of rain is too small to reflect a visible image; but the conjunction of all the images is visible.

M. Mariotte accounts for the appearance of parhelia from an infinity of little particles of ice floating in the air, which multiply the image of the sun, either by refracting or breaking his rays, and thus making him appear where he is not; or by reflecting them, and serving as mirrors. The known laws of reflection and refraction have given a handle for geometrizing on these phenomena; and *M. Mariotte* has determined the precise figure of the little icicles, and their situation in the air, the size of the coronæ, or circles, which accompany the parhelia, and the colours with which they are painted, by a geometrical calculus.

The hypothesis of *Descartes*, to account for that hori-

zontal circle in which mock suns appear, has less probability than any of his conjectures. He supposes that a great quantity of frozen vapours, crowded together by contrary winds, form a prodigious cylinder, which reflects the light that falls from it on all sides, so as to exhibit that lucid appearance in all the surrounding clouds. *M. Huygens*, on applying his attention to these appearances, was soon sensible that they could not arise from such globules as formed the halos; yet, since parhelia are always attended with halos, he was satisfied that their causes must be much alike. Considering, then, what other figures hail-stones might possibly have besides a spherical one, he could find no other so simple as that of a cylinder; and, indeed, he had often observed, that snow did consist of several slender oblong particles, mixed with those of other shapes; and seeing that small globules were sufficient for the production of halos, he imagined that a great number of small cylinders, floating in the air, might produce similar appearances. He also remembered that *Descartes* had taken notice of certain small columns, or cylinders, which he had seen lying on the ground, the extremities of which were bounded with flat stars, consisting of six rays or points.

The large and white horizontal circle, in the Roman phenomenon, *M. Huygens* supposed to be produced by the reflection of the sun's rays from the outsides of the upright cylinders; since, when the sun shines upon a great number of such cylinders suspended in the air, a white circle must necessarily appear to pass through the sun, parallel to the horizon, and of the same breadth with that of the sun. This he shows very distinctly by a large figure of a cylinder, and by pointing out the progress of the sun's rays reflected from it: for every point of the sun's vertical diameter, as well as his centre, will illuminate a circle of cylinders, of the same apparent height as the illuminating point. It is observable that no thick clouds are seen in the air when these circles appear, but only such as are very thin, and scarcely visible: for, in most of these observations, the sky is said to have been very clear and serene, which very well agrees with this hypothesis; since these minute cylinders must constitute a very thin cloud uniformly extended; through which the sun, and even the blue colour of the sky, may be seen.

He then proceeds to demonstrate his hypothesis, by an accurate consideration of the refraction of the rays of light through the sides of such cylinders as have been described; and he investigates the distance at which the parhelia must appear from the sun; showing that it is so much the greater, as the internal cylinder of snow is thicker in proportion to the whole cylinder; and that this distance must become greater as the sun rises higher; and he subjoins a table of these distances, in proportion to any given altitude of the sun; from which it appears, that if a sufficient number of cylinders be placed one above another, (some of which are melted more and some less,) besides the collateral parhelia next the sun, two or more may appear farther from him, but still in the same white circle; which was also confirmed by the observations of *Hevelius* in 1661, and of *Scheiner* in 1630. It appears also, from the same tables, that, while the cylinders remain in the same situation, as the sun rises higher the intervals between him and the two parhelia will increase, which was the very thing that he himself had observed. But a greater alteration of these intervals may happen, if the cylinders be more melted; and from hence might arise that very remarkable phenomenon, which is said to have appeared in the time of Augustus, when three suns were seen at the same time, all of which were soon contracted into one; which, he observes, would be effected by the warmth of the air melting the snow in the cylinders; by which means both the parhelia would draw nearer to the sun, till they coincided with it; at which time all the cylinders would be melted, and changed into round drops.

M. Muschenbroeck says, that nothing has been advanced concerning the cause of parhelia, more probable than the hypothesis of *M. Huygens*, except that frozen cylinders

ders or spiculæ are always found transparent, and are never opaque at the centre. The coloured arcs that accompany parhelia he thinks to be not at all different from the common coronæ; so that, if there be a quantity of icy spiculæ in a thin fog, the whole of this appearance will be produced, the coronæ being formed in the fog, and the parhelia in the spiculæ. See Huygens's *Dissertation* on this subject in Smith's *Optics*, chap. 11. See also Priestley's *Hist. of Light* p. 613. and Muschenbroeck's *Introduction* vol. ii. 4to.

PARI, or PERI, [Persian.] A good genius, a beautiful species of imaginary creature, neither man nor woman, angel nor devil, but answering, in many respects, to that beneficent little being to whom our ancestors paid so much attention, called the *fairy*; which, from the resemblance of the name, and many other circumstances, was, in all probability, of eastern extraction. The old romances of Arabia and Persia allot them a particular country, called *Jinnistan*, where they live upon perfume alone; and conceive them to be so extremely beautiful, that they call a lovely woman *Parizadah*, "born of The Paris," the name of the second daughter of Darius, whom the Greeks have called *Parjatis*; corrupting in the same manner, Sitarah (a star) into *Statira*, and Roshan (splendor) into *Roxana*. The *devas*, or genii, are another species of ideal beings, but the reverse of the *paris*, being ugly, malignant and perpetually at war with them, and with mankind, whom the *paris* are supposed constantly to protect. These two classes of supernatural creatures form great part of the machinery of eastern poetry, fable, and romance, and give a most fanciful and extended field to luxuriant imaginations. *Richardson's Persian Dict. by Wilkins*.

PARIA, a province of South America, in the government of Caraccas, formerly a part of Spanish Guiana; situated to the east of Cumana, on the north-east coast of the continent of South America. Between it and the island of Trinidad, is a large bay, called the *Gulf of Paria*.

There are few places so salubrious, and yet so fertile, in South America, as the valleys of Cape de Paria. Many tribes of Indians inhabit its coasts. Some French families took refuge there during the first storms of the revolution: a considerable number of French colonists from Trinidad, Tobago, and Grenada, have also settled in the same neighbourhood. At first, the Spanish government gave them a good reception; but the beautiful plantations of cocoa, coffee, cotton, and even sugar-manufactories, which they soon formed, tempted the jealous avarice of some local officers of the government. From 1802, various pretences were invented for getting rid of, and plundering, them. Some were driven out and sent away from the most contemptible motives; among others, M. Inardi, a native of Piedmont; the same who is now secretary to the Congress of Venezuela.

The entrance of the Gulf of Paria presents scenes both varied and magnificent. To the east is that majestic river the Oronoco, compared to which those of Europe are but as rivulets! its waves meeting those of the sea, and incessantly disputing the empire of the gulf. To the west appear, rising from the bosom of the horizon, the mountains of Cumana; and by degrees, on approaching the western coast of Trinidad, you discover numerous valleys and plains enamelled with eternal verdure. On nearing the coast, the navigator's view is charmed by a landscape covered with various plantations, and diversified by meandering rivers and rivulets, which water it. A strange and sometimes grotesque medley of white, copper-colour, and black, men, animate this scene. Whilst the numerous canoes of Caribs and Guaraouns skim the gulf in every direction, the traveller sees and hears the negroes working and singing in cadence; troops of monkeys jumping from tree to tree, and twining themselves while suspended from the branches by their tails: innumerable flocks of magnificent birds enliven the scene, by the beauty and variety of their colours. The shores continually resound with the songs

of some and the screeching of others: at the end of this smiling plain, rises the northern mountains, like an amphitheatre, their summits crowned with the noble trees of the tropics, above which the palm, waving its lofty head, attracts the thunder, and forces the clouds to depose their waters at its feet, from whence, precipitating in cascades and torrents, they form rivulets and streams. *Lavayssé's Description of Venezuela, Trinidad, &c.* 1819.

PARIA, a town of South America, and capital of a district in the viceroyalty of Buenos Ayres, beginning 210 miles north-west of that city, and about 120 miles in extent. The air is cold, so that the country produces little grain; which is in some measure compensated by the great plenty of all kinds of cattle; and the cheese made here, both from the milk of sheep and cows, is so highly esteemed, that it is sent into every part of Peru. It has also some silver-mines: eighteen miles south of Oruro. Lat. 18. 50. S. lon. 68. 20. W.

PARIA-TUBA, a town of Brasil, in the government of Para, on the river Amazons: thirty-five miles south-west of Pauxis.

PARIAN, *adj.* [from *Paros*.] Belonging to Paros; brought from Paros.

PARIAN CHRONICLE. See ARUNDELIAN MARBLES, vol. ii. p. 245.

PARIAN MARBLE. See the article MARMOR, vol. xiv. p. 389.

PARIA'NA, *f.* [a name of Aublet's, which as Mr. Professor Martyn remarks, seems to have been suggested by the flowers growing in pairs upon the spike.] In botany, a genus of the class monœcia, order polyandria, natural order of graminæ, or grasses. Generic characters. I. Male flowers in whorls, digested into spikes. Calyx: glume one-flowered, two-valved; valves short, acute. Corolla: two-valved, larger than the calyx; valves ovate, acute, one narrower. Stamina: filaments about forty, capillary, inserted into the bottom of the corolla; antheræ linear. II. Female flower solitary in each whorl, fastened to the axis of the spike. Calyx: glume two-valved; valves ovate, concave, acute. Corolla: two-valved, less than the calyx; valves acute, hairy at the tip. Pistillum: germ three-cornered; style long, hairy; stigmas two, villous. Pericarpium: none; corolla investing the seed. Seed one, three-cornered, inclosed.—*Essential Character*. Male flowers in whorls, forming spikes. Calyx two-valved; corolla two-valved, larger than the calyx; filaments forty. Female flowers solitary in each whorl. Calyx two-valved; corolla two-valved, less than the calyx; stigmas two; seed three-cornered, inclosed.

Pariana campestris, the only species. This plant puts forth several straight shoots, or canes, about one or two feet high. At each joint they are garnished with alternate oval weak leaves, striated throughout their whole length, smooth, glossy, greenish above, paler beneath; the foot-stalks are short, and accompanied by a long split sheath in opposite directions on each side the stalk. This sheath envelops the stem from one joint to the other. The stem is terminated by a serrated spike, formed of several ranges of male flowers growing above each other. The female flower is single in the middle of each range. The spike of flowers is about two inches and a half in length. Grows in woods in the isle of Cayenne. The number of filaments, or stamens, is very extraordinary in the natural order of grasses, to which this plant belongs.

PARIARS, a degraded tribe of Hindoos. See the article HINDOOSTAN, vol. x. p. 121, 123.

PARIDSONG, PARIDRONG, or PHARI, a strong town and mountain of Bootan, on the borders of Tibet; forty miles north-west of Tassifudon. Lat. 28. N. lon. 89. 13. E.

The fortrefs of Phari is a strong stone building, situated on high ground; and on the north and west sides of it is an extensive suburb; on the north is a large basin of water; and on the east a bank of earth projected to a considerable distance, and falling with an easy slope from a level with the rampart into the plain. The valley of Phari

Phari is very extensive, being not less than ten miles long and four broad, surrounded on all sides with rocky hills. At the foot of the rocks, on the west border of the plain, is a large brook, flowing towards the south, called Mahatchieu, which is said to have a passage, through the hills of Nepaul into Bengal. This is the station of Phari Lama, a dependant of Teshoo Loomboo, who is here a little potentate, being superintendant of a goombah, or monastery, and governor of a most extensive range of rocks and deserts, which yield verdure only in the mildest season of the year, when his neighbourhood is frequented by large herds of the long-haired bushy-tailed cattle. From his character and station, he has great influence among the herdsmen. The musk-deer, which produces a valuable article of revenue, abounds in the vicinity of these mountains: it is deemed the property of the state, and hunted only by the permission of government; of course a great part of the musk, which is a secretion formed in a little bag, or tumour, resembling a wen, situated at the navel, and found only in the male, passes through the hands of its agents. It is liable to much adulteration; but that which bears the regent's seal may be regarded as genuine. The musk-deer, in the language of Thibet, is called *la*; and the vascular covering of the musk, *la-tcha*. *Turner's Tibet*.

PARISOVAŹ, a town of Croatia: fifteen miles south of Bihacs.

PARIETAL, *f.* [from *paries*, Lat. a wall.] One of the two thin bones in front of the skull.

PARIETAL, *adj.* Belonging to one of the thin bones in the fore part of the skull.—The lower part of the *parietal* and upper part of the temporal bones were fractured. *Sharp's Surgery*.

PARIETARIA, *f.* [so named from *paries*, a wall, in allusion to the place of growth of the most common species, which is uniformly on old ruins, or mouldering, flint walls.] In botany, a genus of the class polygama, order monoecia, natural order of scabridæ, (urticæ, *Juss.*) Generic characters.—I. Hermaphrodite flowers two, contained in a flat six-leaved involucre: the two opposite and outer leaflets larger. Calyx: perianth one-leaved, four-cleft, flat, blunt, the size of the involucre halved. Corolla: none, unless the calyx be called so. Stamina: filaments four, awl-shaped, longer than the flowering perianth and expanding it, permanent; antheræ twin. Pistillum: germ ovate; style filiform, coloured; stigma penciliform, capitate. Pericarpium: none; perianth elongated, larger, bell-shaped, the mouth closed by converging segments. Seed one, ovate. II. Female flower one, between the two hermaphrodites, within the involucre. Calyx: as in the hermaphrodites. Corolla: none. Pistillum: as in the hermaphrodites. Pericarpium: none; perianth thin, involving the fruit. Seed as in the hermaphrodites.—*Essential Character*. Two hermaphrodite flowers and one female flower in a flat six-leaved involucre. Calyx four-cleft; corolla none; seed one, superior elongated. Hermaphrodite: Stamina four. Female: Stamina none. There are ten species.

1. *Parietaria Indica*, or Indian pellitory; leaves lanceolate, stem erect. This resembles our common pellitory, but is more naked. Leaves lanceolate, drawn out to a much longer point, three-nerved, naked. The balls of flowers are smaller, except the bractes, which are awl-shaped, not ovate; styles longer; fruits sessile, grooved. Native of the East Indies.

2. *Parietaria officinalis*, or common pellitory of the wall: leaves lanceolate-ovate, peduncles dichotomous, calyxes two-leaved. Root perennial, somewhat woody, red, fibrous; according to Lightfoot, creeping. Stems several, nearly upright, from nine inches to a foot or more in height, very much branched, round, striated, solid, reddish, pubescent; according to Lightfoot, rough to the touch and adhesive. Leaves alternate, ovate, pointed, tapering towards each extremity, entire at the edge, spreading, pubescent along the edge and on the veins of the under side, on the upper side deep green, shining,

somewhat wrinkled, and having small prominent points scattered over it. Petioles nearly as long as the leaf is broad, pubescent, channelled above. Flowers small, greenish, rough, sessile, growing in balls or clusters in the axils of the leaves; two hermaphrodites and one female in an involucre of seven leaves (six only, according to Linnæus), permanent; the leaves ovate, pointed, flat, hirsute, the hairs glandular at the extremities. The hermaphrodite flowers may be distinguished by the four stamens, which on the shedding of the pollen fly back with elastic force; the filaments are white and wrinkled transversely; the antheræ ovate, obtuse, double; with a white pollen. Germ green, shining, naked; stigma forming a bright scarlet tuft. The female is known by its situation between the two others, and by its want of stamens: the stigma is somewhat larger, and bent a little down. But, to obtain a perfect idea of the manner in which the fructification is carried on in this plant, the flowers should be examined at a very early period of their expansion; we shall then find in each involucre three red stigmas, the two outermost of which belong to hermaphrodite flowers, whose stamens are not yet visible; the middle one, which is largest and most conspicuous, to the female. If a view be taken of the same flowers at the time that the elastic filaments by their sudden expansion are scattering the pollen, the styles and stigmas of the hermaphrodite flowers, visible before, will often be found wanting, and the germ left naked in the centre of the flower: at this period, the segments of the calyx in the same flowers are nearly of the same length as the filaments, the style and stigma of the female flower remain perfect, and the germ is closely surrounded by a green hairy calyx, which never expands. The period of flowering being now over, a considerable alteration takes place in the calyx of the hermaphrodite flowers; each is considerably elongated, becomes more tubular, assumes a redder colour, has its tip pressed down, and soon drops out of the involucre, in which it leaves no appearance of a seed; but, on opening them, a seed will be found at the bottom of each, perfectly similar to that produced by, and inclosed in, the calyx of the female flower, which does not enlarge as the other does, but, partaking more the nature of a capsule, on pressure, divides at top into four parts, and contains a blackish shining seed. The manner in which the flowers shed their pollen is curious: the filaments, on their first appearance, all bend inwards; as soon as the pollen is arrived at a proper state to be discharged, the warmth of the sun, or the least touch from the point of a pin, will make them instantly fly back, and discharge a little cloud of dust. This process is best seen in a morning, when the sun shines on the plant, in July or August: if the plant be large, numbers will be seen exploding at the same instant.

Mr. Miller is singular in asserting that the *Parietaria officinalis* of Linnæus grows naturally in Germany and Holland, but was not in England till the year 1727, when he introduced it. He makes our plant to be the *P. judaica* of Linnæus, and the *P. minor* of Caspar Bauhin. In this opinion, says Curtis, there is the greatest reason to suppose that Mr. Miller is deceived. It frequently happens that the plant which is common in one country is supposed to be the common plant of other countries, without examination. The figures of Dodonæus and Matthioli, from which those of Ger. emac. and Parkinson are copied, are much fuller of leaves than our plant, and the stem is represented with stiff hairs standing out. The description of Pollich agrees very well with our plant.

Parietary, corrupted into pellitory, is now commonly called pellitory of the wall, being found on walls or among rubbish. It is a native of most parts of Europe, except the most northerly; in Sweden it is not found, but it is in Denmark. Curtis remarks, that the same degree of cold (about 31° of Fahrenheit's thermometer) which stripped the mulberry of most of its leaves, destroyed the greatest part of the herbage of this plant.

Parietary

Parietary promises little from its sensible qualities: it has no smell, and its taste is simply herbaceous. Formerly it was accounted emollient; but, not being mucilaginous, this effect ought rather to be ascribed to the warm water. Its character as a diuretic is better known. Matthiolus tells us, that the expressed juice, sweetened with sugar, had a very powerful effect in this way: and Barbeirac informs us, that a decoction of this plant, and *Uva ursi*, was found of great use in clearing the urinary passages of viscid mucus, and fabulous concretions. Mr. Sole, of Bath, has observed remarkably good effects from the juice of this herb in dropical cases, in which other diuretics had failed; he converts the juice into a thin syrup, and gives two table spoonfuls thrice a-day. Tournefort, also, in his history of plants about Paris, says that the syrup gives great relief in hydropic cases. Dr. Stokes says, he has been informed, that this herb, as well as *Nitraria*, contains a considerable quantity of nitre; and that, in making an extract from it, the mass has taken fire. It is recommended by Bradley to be laid on corn in granaries, for the purpose of driving away the weevil.

3. *Parietaria judaica*, or basil-leaf pellitory: leaves ovate, stems erect, calyxes three-flowered, corollas male elongated-cylindrical. This differs from the former in having shorter stalks, and smaller oval leaves. The flowers are also less, and in smaller clusters. In other respects they are the same. The little balls of flowers are on the branches, scarcely any on the stem. There are two male flowers, which are tubular, cylindrical, with the teeth of the mouth converging. The female flower between them is ovate. According to Gærtner, there are two hermaphrodite flowers and one female flower within a six-leaved involucre. The calyx when ripe is closed, loosely embracing and concealing the seed. Receptacle none, except a very small tubercle at the base of the seed, by which it is connected with the bottom of the calyx, as by a pedicel. Seed ovate, narrowing upwards, compressed like a lens, smooth, shining, dark, having a little white umbilical papilla at the base. Native of Switzerland, the South of France, Sicily, Germany about Gottingen, and of Palestine.

4. *Parietaria lusitanica*, or chickweed-leaved pellitory: leaves ovate, obtuse; stems filiform, striated, even, procumbent. Boccone says, that this differs from that of *Tragus*, and from the common sort of *Matthiolus*, only in the leaves, which are much smaller, the form and size of chickweed: but Tournefort says it is an annual plant, and the same with his *P. lusitanica*, which he found in Portugal, near Lamego upon the Douro. Ray informs us, that in a specimen of the Portuguese plant shown him by Sherard, the leaves were shorter in proportion to their size, and rounder than in the common sort. He found the Sicilian plants in several parts of Sicily; but does not seem to have been aware that they were the same. Boccone says it is very common in that island. In the Kew Catalogue it is said to be a native of Spain and Portugal, without any mention of Sicily; to have been introduced in 1771, by Mons. Richard; and to flower in July.

5. *Parietaria urticæfolia*, or nettle-leaved pellitory: leaves ovate, opposite, petioled, serrate, veined, pubescent; flowers axillary. This is a very branching plant, with small leaves, much resembling those of the nettle. Found by Mons. Thouin in the Isle of Bourbon.

6. *Parietaria cretica*, or Cretan pellitory: leaves subovate; fruiting involucre five-cleft, compressed; lateral segments larger. Found originally by Tournefort, and afterwards by Dr. Sibthorp, on the rocks of Crete and Cinoli. Root fibrous, simple at the upper part, round. Stems numerous, very diffuse, a span long, branched, round, hairy, reddish, leafy. Branches short, alternate. Leaves alternate, stalked, ovate or roundish, obtuse, entire, veiny, hairy, dark-green; dotted with minute tubercles on the upper side. Flowers axillary, sessile, three together, the middle one female.

VOL. XVIII. No. 1255.

7. *Parietaria capensis*, or Cape pellitory: leaves opposite, ovate, serrate; branches diffused; flowers sessile. Found at the Cape of Good Hope by Thunberg.

8. *Parietaria debilis*, or slender pellitory: leaves alternate, ovate, petioled, quite entire, somewhat hairy; peduncles axillary, subtriflorous; stem almost upright. Native of New Zealand: discovered by Forster.

9. *Parietaria cochinchinensis*, or Cochinchina pellitory: leaves ovate, three-nerved, hairy; stem cespitose, diffused; flowers monoecous. Stem herbaceous, perennial, a foot and a half high, manifold, slender. Leaves acute, quite entire, small, opposite, having smaller ones mixed with them. Flowers axillary in whorls, in small clusters or balls, male and female together without any hermaphrodites. Seed roundish, inclosed within the converging calyx. Native of China and Cochinchina. It attracts the worms that infest salted fish or flesh; the natives hang the plant at the mouth of their casks, and the insects get into it of their own accord. It is also esteemed by them to be emollient, refrigerant, and diuretic.

10. *Parietaria arborea*, or tree-pellitory: leaves elliptic, acuminate; somewhat triple-nerved; stem arboreous. This is an upright soft shrub, the height of a man. Root woody, branched, fibrous, rufescent. Stem woody, upright, round, the bark full of chinks, ash-coloured. Branches and branchlets alternate, spreading, villose, pithy. Shoots red, very villose with hoary hairs. Leaves alternate, spreading, entire, nerved; three-nerved above the base, veined: underneath villose soft, above bright-green, from four to six inches long, and from two to four inches wide. Flowers commonly three, clustered, from the axil of each bract, sessile; in the male yellow, in the female red, herbaceous. According to l'Heritier, the male and female flowers are on different plants. What he calls males are imperfect hermaphrodites. In these, he says, the perianth is six-parted; in the female, six or seven leaved, or one-leaved cloven into so many parts; the germ between two nectaries, which are two roundish-four-cornered bodies, very shortly acuminate, opposite by the side of the germ, and without observing accurately might be taken for germs; and probably are so, if we may conjecture from analogy. Native of the Canary Islands, where it was found by Masson. Introduced in 1779. It flowers from February to May; l'Heritier says, in autumn or early in spring; that the male flowered at Kew, and the female at Paris. He first made it an *Urtica*, but afterwards removed it into this genus.

Propagation and Culture. The common European pellitories may be propagated in plenty from the seeds. If these be permitted to scatter, they will fill the ground with young plants. They are difficult to collect, being thrown out of their covers as soon as ripe. Having little beauty, these plants are seldom cultivated. The tree-pellitory may be increased by cuttings, and must have the protection of the greenhouse: as must also the seventh. The first, fifth, eighth, and ninth, must be kept in the stove. See DORSTENIA, MELAMPYRUM, and URTICA.

PARIETARIÆ AFFINIS. See THELYGONIUM.

PARIETES, *f.* [from *paries*, Lat. a wall.] A term used in anatomy for the enclosures or membranes that stop up or close the hollow parts of the body; especially those of the heart, thorax, abdomen, &c.—The *parietes* of the two ventricles of the heart are of unequal strength and thickness; the left exceeding the right, because of its office, which is to force the blood through all parts of the body; whereas the right only drives it through the lungs. Chambers.

PARIETINE, *f.* A piece of a wall; a fragment.—We have many ruins of such baths found in this island, amongst those *parietines* and rubbish of old Roman towns. Burton's *Anat. of Mel.*

PARIGNE' L'EVE'QUE, a town of France, in the department of the Sarthe: nine miles south-east of Le Mans.

PARIL'IUM, *f.* in botany. See NYCTANTHES.

PARIL'LA, a town of South-America, in the province of Panama: seventy miles north-west of Panama.

PARIL'LA, a town of Peru: fifty miles south of Truxillo.

PARILO'VA, a town of Russia, in the government of Irkutsk, on the Angara: sixty-eight miles north of Balaganfkoï.

PARI'MA, called also *Parana Pitinea*, or the White Sea, a lake of South America, in Spanish Guiana, is represented by La Cruz as more than 100 British miles in length by 50 in breadth. Its extent, and even its existence, have been doubted, as it was the noted seat of the city *El Dorado*, the streets of which were paved with gold; a fable, which seems to have arisen from a rock of talc reflecting, like a mirror, the golden rays of the sun. Lat. 3. 40. N. lon. 45. 20. W.

PARI'NA, called also the *Rio Blanco*, or *Branco*, a large river of South America, which rises in the above lake, and, after a southerly direction of 400 miles, runs into the Rio Negro seventy miles from Fort Rio Negro. It also joins the great river Marañon.

PARI'NA CAU'CHA, or COCHA, a town of Peru, and capital of a jurisdiction, in the bishopric of Guamanga; fertile in cattle, corn, and fruit: but the principal riches are from its silver and gold mines.

PARINARI, *f.* in botany. See PETROCARYA.

PARING, *f.* That which is pared off any thing; the rind.—In May, after rain, pare off the surface of the earth, and with the *parings* raise your hills high, and enlarge their breadth. *Mortimer's Husbandry.*

To his guest though no way sparing,
He eat himself the rind and *paring*.

Pope,

PARING and BURNING, the process of paring off the surface of lands in the state of grass, in order to convert them into tillage by means of fire. It is a practice for the most part employed on rough coarse grounds that are over-run with strong plants of the grass, moss, or heath, kinds, and on some mossy or peaty lands. See the article HUSBANDRY, vol. x. p. 529.

PARINO, a town of Mexico, in the province of Culiacan: forty-two miles east of St. Miguel.

PARIPE, a town of Brasil, in the government of Bahia.

PARIPU'RA, a river of Brasil, which runs into the Atlantic in lat. 9. 42. S. lon. 35. 26. W.

PAR'IS, son of Priam, king of Troy, by Hecuba; also named *Alexander*. He was decreed, even before his birth, to become the ruin of his country; and when his mother, in the first months of her pregnancy, had dreamed that he should bring forth a torch which would set fire to her palace, the soothsayers foretold the calamities which were to be expected from the imprudence of her future son, and which would end in the ruin of Troy. Priam, to prevent so great and so alarming an evil, ordered his slave Archelaus to destroy the child as soon as he was born. The slave, either touched with humanity or influenced by Hecuba, did not obey, but was satisfied to expose the child on Mount Ida, where the shepherds of the place found him, and educated him as their own. Some attribute the preservation of his life, before he was found by the shepherds, to the motherly tenderness of a she-bear. Young Paris, though educated among shepherds and peasants, gave very early proofs of courage and intrepidity; and, from his care in protecting the flocks of Mount Ida from the rapacity of the wild beasts, he was named *Alexander*, i. e. "Helper or Defender." He gained the esteem of all the shepherds; and his graceful countenance and manly deportment recommended him to the favours of Cénone, a nymph of Ida, whom he married, and with whom he lived in the most perfect union. Their conjugal peace was, however, of no long duration. At the marriage of Peleus and Thetis, the goddesses of discord, who had not been invited to partake of the entertainment,

showed her displeasure, by throwing into the assembly of the gods who were at the celebration of the nuptials, a golden apple, on which were written the words *Detur pulchriori*, "Let it be given to the fairest." All the goddesses claimed it as their own; the contention at first became general; but at last only three, Juno, Venus, and Minerva, wished to dispute their respective right. The gods, unwilling to become arbiters in an affair so tender and so delicate in its nature, appointed Paris to adjudge the prize. The goddesses appeared before their judge without ornament, and each endeavoured by promises and entreaties to gain the attention of Paris; and, to influence his judgment, Juno promised him a kingdom; Minerva, military glory; and Venus, the fairest woman in the world. After he had heard their several claims and promises, Paris adjudged the prize to Venus, and gave her the golden apple, to which, perhaps, she seemed entitled as the goddess of beauty. This decision of Paris drew upon the judge and his family the resentment of the two other goddesses.

Soon after, Priam proposed a contest among his sons and other princes, and promised to reward the conqueror with one of the finest bulls of Mount Ida. His emissaries were sent to procure the animal; and it was found in the possession of Paris, who reluctantly yielded it. The shepherd was anxious to regain his favourite; and he went to Troy, and entered the lists of the combatants. He was received with the greatest applause; and obtained the victory over his rivals, Nestor the son of Neleus, Cyrenus son of Neptune, Polites, Helenus, and Deiphobus, sons of Priam. He likewise obtained some advantage over Hector himself; which prince, enraged to see himself conquered by an unknown stranger, pursued him closely; and Paris must have fallen a victim to his brother's rage, had he not fled to the altar of Jupiter. This sacred retreat preserved his life; and Cassandra, the daughter of Priam, struck with the similarity of the features of Paris with those of her brothers, enquired his birth and age. From these circumstances she soon discovered that he was her brother, and as such she introduced him to her father and to her brothers. Priam acknowledged Paris as his son, forgetful of the alarming dreams which had caused him to meditate his death; and all jealousy ceased among the brothers.

Paris did not long suffer himself to remain inactive; he equipped a fleet, as if willing to redeem Hecione, his father's sister, whom Hercules had carried away, and obliged to marry Telamon the son of Æacus. This was the pretended motive of his voyage, but the causes were far different. Paris remembered that he was to be the husband of the fairest of women; and, if he had been led to form those expectations while he was an obscure shepherd of Ida, he had now every plausible reason to see them realized, since he was the acknowledged son of the king of Troy. Helen was the fairest woman of the age, and Venus had promised her to him. On these grounds, therefore, he went to Sparta, the residence of Helen, who had married Menelaus. He was received with great respect; but he abused the hospitality of Menelaus, and, while the husband was absent in Crete, Paris persuaded Helen to elope with him, and to fly to Asia. Helen consented; and Priam received her into his palace without difficulty, as his sister was then detained in a foreign country, and as he wished to show himself as hostile as possible to the Greeks. This affair was soon productive of serious consequences. When Menelaus had married Helen, all her suitors had bound themselves by a solemn oath to protect her person; and therefore the injured husband reminded them of their engagements, and called upon them to recover her. Upon this, all Greece took up arms in the cause of Menelaus; Agamemnon was chosen general of all the combined forces, and a regular war was begun. Paris, meanwhile, who had refused Helen to the petitions and embassies of the Greeks, armed himself, with his brothers and subjects, to oppose the enemy; but the success of the war was neither hindered nor accelerated by his means.

PARIS AND PARNASSIA.

Herb Paris.

Carolina Grass of Parnassus.

means. He fought with little courage; and, at the very sight of Menelaus, whom he had so recently injured, all his resolution vanished, and he retired from the front of the army, where he walked before like a conqueror. In a combat with Menelaus, which he undertook by means of his brother Hector, Paris must have perished, had not Venus interfered, and stolen him from the resentment of his antagonist. He wounded, however, in another battle, Machaon, Euryphilus, and Diomedes; and, according to some opinions, he killed with one of his arrows the great Achilles.

The death of Paris is differently related: some say that he was mortally wounded by one of the arrows of Philoctetes, which had been once in the possession of Hercules; and that, when he found himself languid on account of his wounds, he ordered himself to be carried to the feet of Ceneone, whom he had basely abandoned, and who in the years of his obscurity had foretold him that he would solicit her assistance in his dying moments. He expired before he came into the presence of Ceneone; and the nymph, still mindful of their former loves, threw herself upon his body, and stabbed herself to the heart, after she had plentifully bathed it with their tears. Whatever was the mode of his death, it is understood to have taken place about the year 1188 B.C.

It is agreed on all hands that Helen was taken back by her husband after the death of Paris; (see HELEN, vol. ix.) but whether she was really in Troy during the war undertaken on her account, is not clear. It is probable she was not; and it is always worthy of curiosity to observe how far fable agrees with history. The following is an extract from Salmon's General History, (Asia.)

"Proteus, king of Egypt, resided at Memphis, where, in Herodotus's time, his temple was still standing, in which was a chapel dedicated to Venus the Stranger. It is conjectured that this Venus was Helen; for, in the reign of this monarch, Paris the Trojan, returning home with Helen, whom he had stolen, was driven by a storm into one of the mouths of the Nile, called the Canopy, and thence was conducted to Proteus, at Memphis, who reproached him in the strongest terms for his perfidy in stealing the wife of his host with all the effects in his house. He added, that the only reason he did not punish him with death, (as his crime deserved,) was because the Egyptians did not care to imbrue their hands in the blood of strangers; but that he would keep Helen, with all the riches that he brought with her, to restore them to their owner; that, as for himself, (Paris,) he must either quit his dominions in three days, or expect to be treated as an enemy. The king's order was obeyed; Paris continued his voyage, and arrived at Troy, whither he was closely pursued by the Grecian army. The Greeks summoned the Trojans to surrender Helen, and, with her, all the treasures of which her husband had been plundered. The Trojans answered, that neither Helen nor her treasures were in their city; nor indeed was it at all likely, says Herodotus, that Priam, who was so wise an old prince, should choose to see his children and country destroyed before his eyes, rather than give the Greeks the just and reasonable satisfaction they desired. But it was to no purpose for them to affirm, with an oath, that Helen was not in their city: the Greeks, being firmly persuaded that they were trifled with, persisted obstinately in their unbelief. The Deity, continues the same historian, resolved, that the Trojans, by the total destruction of their city, should teach the affrighted world this lesson; that great crimes are attended with as great and signal punishments from the offended gods. Menelaus, in his return from Troy, called at the court of king Proteus, who restored him Helen with all her treasure. Herodotus proves, from some passages in Homer, that the voyage of Paris to Egypt was not unknown to this poet."

How much might the effect of that excellent poem the Iliad, have been heightened, had it been carried on agreeably to the history, as above related! At present, Priam's

age and misfortunes can excite no real compassion, while he detains Menelaus's wife in the city, and protects Paris in his outrage. It may be objected to this, that the absence of Helen would deprive us of many fine descriptions, and a beautiful episode; but there is little doubt the poet could have supplied these in another manner; and the main subject of the poem (the anger of Achilles) would have suffered no alteration.

PAR'IS, *f.* [of very obscure etymology. Professor Martyn leaves it unexplained, as Tournefort and Linnæus had done before him, all of them either overlooking, or being dissatisfied with, the explanation of Ambrosinus; who, in his Phytologia 506, derives it a *paritate foliorum*, from the uniformity or equality of the four leaves, which make, as it were, two pair, equally situated. As the English name is *herb true-love*, perhaps it may be derived from that famous lover of antiquity, the subject of the preceding article.] HERB PARIS; in botany, a genus of the class octandria, order tetragynia, natural order of farmentaceæ, (asparagi, *Juss.*) Generic characters—Calyx: perianth four-leaved, permanent; leaflets lanceolate, acute, the size of the corolla, spreading. Corolla: petals four, spreading, awl-shaped, (linear, *Gartner.*) like the calyx, permanent. Stamina: filaments eight, awl-shaped, below the antheræ short; antheræ long, fastened on both sides to the middle of the filaments. Pistillum: germ superior, round-four-cornered, (or subglobular.) Styles four, spreading, shorter than the stamens; stigmas simple. Pericarpium: berry globular-four-cornered, four-celled. Seeds several, incumbent in a double row.—*Essential Characters.* Calyx four-leaved; petals four, narrower than the calyx; berry four-celled. There are two species.

1. Paris quadrifolia, herb Paris, true-love, or one-berry: leaves ovate, about four. Few plants are more readily distinguished than this, by the proportion and regularity of all the parts. Stalk quite simple or unbranched, upright, smooth, round, naked. Leaves four, in a cross, or a sort of whorl, spreading, sessile at the top of the stalk, ovate, quite entire, drawn to a point, smooth, nerved underneath, three or four inches long, and two wide. Peduncle single, rising from the middle of the four leaves, somewhat angular, about an inch in length, supporting one greenish flower, an inch in diameter. Calyxine leaflets four, linear-lanceolate, acute, reflex. Petals also four, very narrow, reflex, a little shorter than the calyx; stamens eight; antheræ in the middle of the filament; styles four, three times shorter than the stamens; hardly so long as the berry, purplish black. Berry one, black, large, flattened at top, obscurely four-grooved, smooth, juicy, and containing in each cell six or eight seeds. Root perennial, fleshy. See the annexed Plate.

The leaves and berries are said to partake of the properties of opium; and the juice of the latter to be useful in inflammations of the eyes. Linnæus says the root will vomit as well as ipecacuanha, given in a double quantity. Bergius recommends the herb for discussing buboes and other inflammatory tumours, in the hooping or convulsive cough, &c. Gesner experienced it to be an antidote to the poison of the nux vomica. Having given a scruple of it to two dogs, he gave one a dram of the herb, and it recovered; the other died. He also took a dram of the herb himself, without any effect except a dryness in the fauces, and some sweat. Burghard on the contrary says, that cardialgia and vomiting ensue from the use of it; and Krockner was credibly informed, that a child died by eating the berries, and that another was recovered with difficulty. Gesner affirms that the berries are baneful to poultry. It ought therefore to be given with great caution. One scruple is given twice a-day.

Herb Paris is a native of most countries of Europe, particularly the northern parts; and also of Japan. In Britain it is not uncommon, in woods, especially those which are thick, and on strong soil. Gerard says, "it grows plentifully in Chalkney-wood, near Wakes Colne in Essex, in the parsonage orchard at Radwinter, and in Bocking-

Bocking-park by Braintree in the same county; in the wood by Robin Hood's Well, near Nottingham; in the moor by Canterbury, called the Clapper; in Blackburne at Merton in Lancashire; in Dingley-wood, six miles from Preston in Aundernesse; at Heflet in Lancashire; and in Cotting-wood in the north of England, as that excellent, painful, and diligent, physician, Mr. Doctor Turner, of late memory, doth record in his Herbal." Parkinson, in 1640, says it was then lost in the above places, "every one running thereunto, that is next him, and gathering it." He informs us that it was found in his time in Hinbury-wood, three miles from Maidstone in Kent, in a wood called Harwarth, near Pinnenden-heath; by Maidstone, in Long-wood by Chiselmhurst, and in the next called Islets-wood, and in a wood over against Boxly-abbey near Maidstone. Mr. Newton found it in the Long Spring by Petesbogs at Chiselmhurst; and Mr. Ray in Lampit-grove, at Notley, Essex. Mr. Charles Miller discovered it in a little wood, not far from Hampstead; and yet Mr. Curtis has not introduced this curious plant in his valuable *Flora Londinensis*. Mr. Blackstone found it in Hanging-wood, near Harefield, Middlesex; Mr. Abbot at Hawnes, Renhold and Clapham, Park-wood in Bedfordshire; in Kingston, Eversden, and Ditton, woods, Cambridgeshire; in Love-lane near Derby, by Mr. Wately; at Selborne, in Hampshire, by Mr. White; Rip-ton-wood, in Huntingdonshire, by Mr. Woodward; Byseing-wood, in Kent; in Hollinghall, Stocking and Okeley-wood in Leicestershire, by Dr. Pulteney; in Brampton, Cranley, and Hardwick, woods, and Whittleborough-forest, in Northamptonshire, by Moreton; in

Asply and Colwick woods, Nottinghamshire, by Deering; in Headington-Wick-copse, Oxfordshire, by Dr. Sibthorp; in the wood by the Devil's Den, near Clifton-upon-Teme; woods on the sides of Breedon-hill, and about Frankly, in Worcestershire; near Gainford and in Raby-park, by Mr. Robson. In Scotland, in a wood a mile to the south of Newbottle, near Dalkeith, by Dr. Parsons; in the Den of Bethaick, four miles from Perth, by Mr. Lightfoot; in the wood of Methven, Perthshire, by Mr. Millar. It flowers in May; but is with great difficulty preserved in gardens. The best way is to take up the plants from the places where they grow wild, preserving good balls of earth to their roots, and plant them in a shady moist border, where they may remain undisturbed.

2. *Paris polyphylla*, or many-leaved herb Paris: leaves lanceolate, eight or ten. Discovered by Dr. F. Buchanan, growing in woods near rivulets, in Upper Nepaul, where it is known by the name of *dai swa*. The root is creeping, but much thicker and more tuberous than the former. Stem a foot or more in height, brownish, thrice the thickness of the first species, crowned like that with a whorl of leaves, in a similar spreading position, but about twice as numerous, and much narrower, being elliptic-lanceolate, taper-pointed, triple-ribbed; each supported on a short purplish stalk. Flower-stalk much shorter than the former; but the flower is larger, of the same green colour. Its calyx-leaves and petals are usually five, with ten stamens, but sometimes only four with eight stamens, or even three with six.

HERB PARIS of CANADA. See TRILLIUM.

P A R I S.

PARIS, the capital of the kingdom of France, is situated on the river Seine; and is one of the largest and finest cities in Europe. It is 225 miles south-south-east from London; and in lat. 48. 51. N. lon. 2. 25. E.

PARIS derives its name from being the capital of an ancient people called Parisii; but when it first assumed that appellation is unknown. Numerous are the conjectures respecting the derivation of the word *Parisii*. Some have imagined that this tribe descended from the *Parrhasians*, a people of Arcadia, whom Hercules conducted to Gaul. Others have pretended that some Trojans, escaping from the destruction of their country, fled to Gaul, and, building a new city, called it Paris, in honour of the son of Priam. Others have derived the name from Paris, the eighteenth king of Celtic Gaul. Many respectable authors have adopted an opinion not destitute of ingenuity. A noble temple, dedicated to the worship of Isis, once stood in the neighbourhood of Paris: its ruins were lately to be seen near St. Germain-des-Près: hence the surrounding inhabitants were called *Par-Isii*, or those who lived near the temple of Isis. The most probable conjecture is, that this tribe of Gauls denominated Parisii from their inhabiting the banks of the Oise, whose ancient name was *Isia*.

The origin of Paris is wrapped in total obscurity. The first mention which occurs of it is in the Commentaries of Cæsar, book vii. An universal revolt of the Gauls had taken place on the return of their conqueror to Italy; yet, jealous of each other, as well as indignant at the yoke of the invader, they had neglected to concentrate their forces, and each tribe had sworn singly to defend its native soil from the usurpation of the Romans. Labienus, one of the lieutenants of Cæsar, attacked them separately, and found them an easy conquest. Having subdued twenty-five of the Gaulish tribes, he presented himself before the capital of the Parisii, which was then called *Lutetia*, probably from the Latin *lutum*, mud, from its

situation amidst marshes and dirt. It was then entirely contained within that island on the Seine, which, at the present day, is called *l'Isle du Palais*; and, in comparison with the capitals of the other provinces of Gaul, Lutetia was but a sorry village; its houses were small, of a round form, built of wood and earth, and covered with straw and reeds. When the Romans had conquered Lutetia, they embellished it with a palace, surrounded it with walls, and erected at the head of each of the two bridges leading to it, a fortress, one of which stood on the site of the prison called the Grand Chatelet, and the other on that of the Petit Chatelet. The Yonne, the Marne, and the Oise, being rivers which join the Seine, suggested the idea of establishing a trading-company by water, in order to facilitate, by those channels, the circulation of warlike stores, and provisions. The merchants were called *Nautæ Parisiaci*. The Romans also erected, near the bank of the Seine, a magnificent palace and aqueduct. This palace was called *Thermæ*, on account of its tepid baths. Julian, being charged to defend Gaul against the irruptions of the barbarians, took up his residence in these Thermæ in the year 360, two years before he was proclaimed emperor, in the square which was in the front of the palace. "I was," says he, in his work entitled *Misopogon*, or the Enemy of the Beard, "in winter-quarters in my dear Lutetia. Thus is named, in Gaul, the little capital of the Parisii." And by another ancient writer, it is described as an inconsiderable island, surrounded with walls, the foot of which is bathed by the river; and the entrance, on each side, by a wooden bridge.

Towards the middle of the fifth century this city passed from the dominion of the Romans to that of the Franks; and, in 508, Clovis declared it the capital of his kingdom, and contributed very much to the establishment of it; he also abrogated its Roman name, and restored that of *Paris*, by which it has ever since been distinguished. Clovis fixed the seat of his empire here. Under the princes

of this dynasty, who reigned 266 years, the Latin tongue ceased to be commonly spoken, and was succeeded by, or mingled with, the Celtic. The Roman laws yielded to the Salic customs, and the people were enslaved by the nobles, and became their absolute property. Paris, however, preserved its liberty, its commerce on the Seine, and its municipal laws; but literature and the arts had fled, and the night of ignorance overpread the whole of the continent.

Few of the princes of the *second* dynasty resided at Paris. Charlemagne, occupied by his conquests, never inhabited it, although he occasionally held his court at St. Denis. Nevertheless, the Parisians were much indebted to him; for his love of science and the arts suggested the establishment of numerous schools, by the influence of which the character and manners of the people were materially and happily changed.

Under his feeble successors, Paris became the patrimony of some of the hereditary counts.

Allured by its riches, the Normans pillaged it in 845. They reduced it to ashes, and desolated even its suburbs, in 856; and, in 872, they once more attacked and ravaged it. These disasters have left few vestiges of the monuments built by the Romans, or by the kings of the first dynasty. In 885, the Normans again attempted the siege of Paris. In vain the inhabitants entreated succour from Charles the Bald. Their own valour, directed by the genius of their noble count Eudes, compelled the Normans to raise the siege at the end of two years. Charles, justly covered with ignominy, was deposed, and the crown placed on the head of Eudes. It became hereditary in his family, when his grandson, Hugh Capet, was elected in 987.

The first princes of this dynasty, anxious for the prosperity of a city that had been their peculiar patrimony, and the defence of which had elevated them to the throne, continued to reside here, in the edifice now called the Palace of Justice. They confirmed the ancient privileges of the citizens, and granted them many new immunities. The schools of instruction were increased, and the university established. A new city was added to the ancient capital towards the north, and fortified with walls.

Paris owes some of its chief ornaments to Philip Augustus, who erected many of the public buildings, paved the streets, and completely surrounded the city with walls, comprising in the enclosure a great number of small towns and hamlets in the vicinity: the undertaking occupied about twenty years, having been begun in 1190, and finished in 1211. This monarch was the first who caused the streets to be paved: orders for this purpose were issued in 1184, nearly about the same time that the walling was begun; and some say that from this time only the name of Lutetia, or "muddy," was changed for that of Paris, or "fair." We know of no other city in Europe that was paved at this time, except Cordova in Spain, which was paved as early as the year 850, or thereabouts. Neither are we to suppose that Paris was completely paved at this time; for there is evidence that, in the year 1620, the streets in many quarters still emulated their ancient name of Lutetia. Peter Heylin, writing about that time, says, "This I am confident of, that the nastiest lane in London is frankincense and juniper to the sweetest street in this city." And Howel (same date), "This town is always dirty; and 'tis such a dirt that by perpetual motion is beaten into such a thick black unctuous oil, that where it sticks no art can wash it off of some colours; inasmuch, that it may be no improper comparison to say, that an ill name is like the dirt of Paris; which is indelible. Besides the stain this dirt leaves, it gives also so strong a scent, that it may be smelt many miles off, if the wind be in one's face as he comes from the fresh air of the country."

The wars with the English required new fortifications; and in the reigns of John and Charles V. in the fourteenth century, ditches were dug, and the Bastile erected.

VOL. XVIII. No. 1256.

Francis I. the restorer of literature and of the arts, neglected nothing that might conduce to the embellishment of this capital. He caused new streets to be made, many Gothic edifices to be pulled down, and was, in France, the first person who revived Greek architecture, the remains of which, buried by the hand of time, or mutilated by that of barbarians, being collected, began to improve the genius of celebrated artists, and in the sequel led to the production of many fine master-pieces of art. The successors of Francis executed part of his projects, and this extensive city imperceptibly lost its irregular and Gothic aspect.

Henry IV. was the first of the kings of France who embellished Paris with regular squares, or open spaces, decorated with the different orders of architecture. Having nearly finished the Pont Neuf, he built the Place Royale, and also the Place Dauphine.

During the brilliant reign of Louis XIV. the gates of Paris were converted into arcs of triumph; and its ditches, being filled up and planted with trees, became public promenades; hence the origin of the Boulevards, the pride of Paris, and the admiration of every stranger. Yet Paris was not the favoured city of this prince; for, had he expended on it a fourth part of the money which he lavished on Versailles, it would have become the most astonishing city in Europe. It must however be admitted, that he contributed a vast deal to the embellishment of it: he built the hospital and church of the Invalids, opened eighty new streets, erected more than thirty churches, built two squares, four bridges, five gates, fifteen fountains, raised the Observatory, and finished the Louvre.

Under the influence of Louis XV. this grand scheme of improvement was continued; and to this monarch the French are indebted for the Palais Bourbon, the Place Louis Quinze, with its colonnades, the Champs Elysees, the Ecole de Chirurgie, the Ecole Militaire, and the Pantheon, or church of St. Genevieve. The unfortunate reign of Louis XVI. afforded little opportunity for the erection of public buildings; yet this prince opened several new streets, erected some churches and hospitals, rebuilt the Palais de Justice, most of the theatres, and began the Pont Louis XVI. and the New Madeleine (Temple of Glory).

The embellishments of Paris during the reign of Napoleon are thus summed up. He built three bridges across the Seine, the Pont Jena, des Arts, and d'Austerlitz; the pillar in the Place Vendome, the portico of the Palais Bourbon, the triumphal arch in the Place de Caroussel, part of the new wing of the Louvre, the fountains on the Boulevard St. Martin and of the Ecole de Medicine. He also completed the Palace of the Old Louvre, raised the new staircase of the gallery, improved and embellished the Luxembourg, ordered the outside of several palaces to be cleaned and repaired, and the dome of the Invalids to be gilt. He had commenced a triumphal arch at the Barriere de Neuilly, which, from its magnitude, was to have surpassed every similar edifice. The elevation of this building is already considerable, and forms a conspicuous object from the Tuileries, the banks of the Seine, and all their vicinity. He made several streets, erected sixty public fountains, and abreuvoirs, or drinking-places for horses, in several places at Paris, four abattoirs for slaughtering cattle at the four extremities of Paris, granaries of abundance, &c.

But one of the grandest projects of Napoleon was to have opened a new street, ninety feet wide and about two miles in length, extending from the triumphal arch in the Caroussel, which was to have stood in the centre of it, through the whole length of Paris, over the ground of the street called Rue St. Antoine, till it joined the arsenal and the site of ground of the late Bastile at the Barriere d'Enfer, there to terminate in a fountain formed of an immense elephant in brass. The street was to have been named *Rue Imperiale*. If it had been completed, it would have made the most magnificent street in Europe.

It is here but justice to observe, that Louis XVIII. has not been inattentive to the ornamenting of his capital; since his return several little improvements have been made, particularly in the Palais Royal, where a handsome fountain has been erected in the centre of the garden, which adds much to the beauty of this enchanting spot. It was opened in March 1817.

The superficial extent of Paris at various epochs has been traced by MM. Legrand and Landon, (*Description de Paris*, 1808.) In the time of Julius Cæsar, B. C. 56, being confined to a small island in the Seine, it measured only about 44 *arpens*, or acres; in the reign of Francis I. 1414 *arpens*; under Louis XIV. and XV. 3919; and under Louis XVI. in 1788, it measured 9858 *arpens* and three perches, and might then contain about 26,000 houses. At present the number of houses is calculated to be 29,400; we may say, for a round number, 30,000. There are 1062 streets; 117 culs-de-sac (courts with no thoroughfare); 28 quays; 18 boulevards (malls); and 56 barriers (gates).

From a work lately published by the Academy of Sciences, it appears, that Paris contains 715,595 inhabitants, (and all France 29,327,388.) The fixed population of Paris is 657,172. The number of births annually is 21,000, and of these the proportion of male to female is 25 to 24; yet the surviving females at present in Paris exceed the males by about one-fifth. The consumption of provisions annually is 206 millions of loaves; 21,000 quarters of wheat; 8,500 quarters of barley; 75,000 oxen; 15,000 neat cattle; 10,000 calves; 220,000 sheep; 550,000 hogs; 100,000 quintals (hundred weight) of sea-fish; 1,300,000 francs worth of fresh-water fish; 6,000 hogheads of cider; 30,000 hogheads of beer; 33 millions of wine; and 3 millions of brandy.

Before the revolution, Paris contained 46 parish-churches, and 20 others answering the same purpose; 11 abbeys, and 133 monasteries, or convents of men and women; 13 colleges, 15 public seminaries, and 26 hospitals. At the beginning of the revolution several of these buildings were destroyed; almost all the monasteries and convents were suppressed, and, together with the churches belonging to them, sold as national property, and either demolished for the sake of their materials, or converted to different uses. Three of them were converted into commodious healthy prisons, and a penitentiary house for women, viz. St. Pelagie, St. Lazare, and the Madelonnettes. Four other convents have become extensive hospitals: the Lying-in Hospital, the Hospital for Venereal Diseases, and the Military Hospital of the Val de Grace. Six commodious, and most of them elegant and extensive, markets, have replaced a like number of convents and churches; viz. The Market of the Jacobins, so called from the Dominican Friars; the Poultry and Game Market has replaced the Augustine monks; the Market of St. Martin, built on part of the garden of the Benedictine abbey of St. Martin; the market of the Blancs Manteaux, old Rue du Temple; the Market of the Carmes, where the Carmelite monks were established; the market of St. Joseph has replaced the church dedicated to that saint; the convents of the Petits-Pères, that of the nuns of the Panthéon; that of the Minimes, and some others, have been converted into useful and commodious barracks. The Seminary of St. Sulpice has been pulled down to make room for a fine square, ornamented with a fountain; and to display a full view of the front of the church of St. Sulpice, undoubtedly one of the finest monuments of architecture in Paris. The extensive buildings of the Sorbonne have been appropriated to lodge commodiously thirty-six artists, with their families. The eminently useful Quays which border the island Notre Dame, or la Cité, have replaced filthy unhealthy buildings of every description. The magnificent new Exchange is erecting on the garden which belonged to the nuns that were called Filles St. Thomas. The famous Polytechnic School occupies the mansion, considerably enlarged, of the Col-

lege of Navarre, a celebrated school of divinity. The useful Normal School replaces a religious establishment. The National Institute is installed under the dome of the College Mazarin. The Lyceum of Charlemagne was formerly the College of the Jesuits; a part of the building has been appropriated for the City Library. The Institution for the Deaf and Dumb replaces the ancient ecclesiastical seminary of St. Magloire. The healthy spacious Hospital for Incurables, in the Fauxbourg St. Martin, was formerly a convent of mendicant friars; and the Abbaie de St. Martin is now the useful and splendid Conservatoire des Arts. The ground on which the Bastille stood has been transformed into a beautiful boulevard, the Boulevard Bourdon. The famous Canal de l'Ourcq will end here; and probably few will regret this metamorphosis of the Bastille.

We know not whether the convents and religious edifices in other parts of France were destroyed or converted to the proportionate extent that they were in Paris; but we are told that there are now (1820), in all France, no more than 36,185 priests, (see FRANCE, vol. vii. p. 896.) while there are 106 female congregations, possessing 1721 establishments, which contain 11,762 sisters: these charitable women administer relief to nearly 69,000 sick persons, and instruct gratuitously 63,000 poor children.

Paris is divided into twelve mayoralties, each of which is presided over by a central officer of the municipal police. The faubourgs retain their ancient names, but those of many of the streets have been changed since the revolution. In proportion as the limits of the capital became extended, the real gates were removed, but they re-appeared under the name of *barrières*. These edifices, many of which were very costly, were constructed during the ministry of Calonne, under the direction of Ledoux, the architect, who has taken pleasure in varying their form and character. One represents an observatory; another, a chapel; some have the appearance of rusticated buildings; others of temples. There are about sixty of these *barrières*, which, during the revolution, were frequently shut to serve the purposes of party, and to favour the arrest of particular persons: they are now occupied by custom-house officers, whose business is to collect duties, and to watch that no contraband goods find their way into the city.

The river Seine, which intersects Paris as the Thames does London, is justly esteemed one of the most beautiful in France; it is of a light sea-green hue, a singularity which adds to the effect of the noble bridges and quays. This colour is not observable before the junction of the Seine and Marne, where it may be clearly observed to belong to the latter stream, the Seine being of a brown or muddy appearance, while the green hue of the Marne continues unpolluted for a considerable space. Towards the north this plain is bounded by a semicircular range of gentle elevations, mostly composed of gypsum, or alabaster, which by combustion yields the noted *plaster of Paris*. This substance is much used in the construction of the houses. The calcareous free-stone, with which the superior hotels are built, is drawn from the quarries on the south of the city; and to the discovery of these quarries, about the middle of the sixteenth century, the present magnificence of Paris is chiefly owing.

The river forms two small islands, denominated Isle St. Louis and Isle Notre Dame. The former is the ancient city; and derives its name from a building wherein the kings of the first dynasty resided, and which was afterwards appropriated to the reception of the parliament. The quarter denominated the *Ville* is situated on the north, the university is on the south, and the city stands in the centre. Its extent along the river is about four miles and a half; its breadth, from the Barrier St. Denis to the Barrier St. Jacques, about three miles and a half. The new walls enclose a very considerable space of ground which is uninhabited, and even under tillage: hence the real extent of the city is very different from its apparent magnitude.

The ravages of the Normans in the tenth century, and

and the taste of the French for novelty, have left few ancient monuments at Paris. Of the Roman, there is only one fall of the Palais de Thermes, at present a dépôt belonging to a cooper in Rue de la Harpe. The Hotel de Cluny, that was built out of the remains of this palace, which extended as far as the Rue de St. Jacques, had nearly destroyed all that was left of the only edifice in Paris in which the Roman mode of building could be traced. The dimensions of the apartment before mentioned are 38 feet by 56, and its height from the present soil 40 feet. The light had been introduced by a large window in the form of an arcade, and this was placed above a large circular niche over the entrance. The vault, like all the Roman baths, is formed of a blocking of bricks and *moellons*, cemented by a mortar, a mixture of lime and sand. For a number of years a garden was spread over the surface of this bath, which did not appear to have undergone any alteration from the layers of vegetable earth from three to four feet in thickness, and continually exposed to rain and the water bestowed upon its growth; another proof of the duration which the Romans gave to their works. The walls of this apartment were stuccoed from four to five inches in thickness. Underneath it, is a double row of cellars, or rather large conduits nine feet high, and as many in breadth. The neighbouring Hotel de Cluny is one of the most ancient and elegant Gothic structures in Paris. La Tour de St. Jean de Latran is, it is said, the remains of the palace inhabited by Clovis upon the mountain St. Genevieve. It is remarked that the tower of St. Jacques de la Boucherie, near the site of the ancient church, was preserved because Nicholas Flamel, the alchemist, took up his residence near it. The house of the canon Fulbert, near Notre Dame, is still recognized by two ancient medallions sculptured in the wall, representing Eloisa and Abelard. A huft of Henry IV. in Rue de la Ferronnerie, marks the spot where he was assassinated, opposite la Croix d'Or. The duke d'Orleans, brother of Charles VI. fell under the poignards directed against him by the duke of Burgundy, nearly opposite the Rue des Blancs Manteaux; and the house, Rue de Bethizy, is still recognized with regret, as that in which admiral Coligni was massacred. L'Hotel de la Salamandre, which belonged to the dukes d'Etampes, mistrefs to Francis I. who occupied the nearly adjacent Palais d'Amour, is now an obscure inn.

Throughout the ancient part, and in the centre, of Paris, the streets are narrow, dark, and dirty. Few of them have pavements for the accommodation of foot-passengers; and the pitching of the streets is composed of uneven and pointed stones, on which it is extremely difficult to walk in wet weather, and by which the pedestrian is soon rendered foot-sore. The coachmen have no established rule by which they drive on the right or left of the road, but they cross and jostle one another without ceremony. They drive close to the very doors of the houses, and either cover the foot-passenger with mud, or endanger his limbs or his life. The Paris Jehu has not the slightest regard for the comfort or safety of the pedestrian; he gives him little notice, although his horses are close upon him, and ready to trample him down: yet the accidents which occur from this infamous practice are not so numerous as might be expected. Were it not for a few large stones which project from some of the houses, and the receding door-ways of others, the disasters of the streets would form a more conspicuous item than they now do in the bills of mortality.

On account of the irregular and confused manner of driving through the streets, it is inconvenient, and even dangerous, to appear in them on horseback. The traveller will, therefore, have no temptation to take his Bucphalus to the continent; or, should he be determined to sport his charger in Paris, his rides will be confined to the Boulevards, the Elysian fields, the Bois de Boulogne, and the banks of the Seine. For the same reason, the gig and curricie should be left in England. The inconvenience

and danger of traversing the streets of Paris, together with the comparative poverty of the higher classes in France, will account for the small number of gentlemen's carriages that are seen in the French metropolis. Fiacres and cabriolets roll along in abundance; but the splendid equipages which crowd the British capital are thinly scattered in the streets of Paris.

The houses, which are generally constructed of stone, are six or seven stories high; and, not unfrequently, seven or eight families occupy the different apartments and subdivisions of the enormous edifice. This motley collection of inmates is a peculiar feature of the French metropolis. The first floor is probably occupied by one of the ancient noblesse, or by a chevalier who can trace his descent from the first dynasty of the monarchs of France. He perhaps pays 300*l.* per annum for the rent of his share of the edifice. Above him are tenants possessed of different gradations of fashion or opulence, to the sixth or seventh floor, which are inhabited by the milkman, the cobbler, or the scavenger, who only pay a rent of ten pounds. The whole of this ill-assorted community use the same magnificent staircase, decorated by marble columns, enriched with beautiful bas-reliefs, and embrowned by the collected filth of a hundred dirty feet. Occasionally the common staircase is swept by the porter; but in some hotels it is suffered to remain in a horribly disgusting state; for, the cleansing of it, being the duty of no particular floor, is neglected by all, and many months pass without its being profaned by mop or broom. In no other city but Paris would the access to the most elegant and splendid apartments lie through an avenue, which the gentlemen are sometimes compelled to traverse on tip-toe, and in which the ladies are constrained to elevate their petticoats quite as high as decency will allow.

One proof of a total want of taste, or rather of a sense of propriety, in the French, should not be forgotten. When an hotel (a large house) is inhabited by one opulent or noble family only, it is not unusual to make the upper story the receptacle for the hay and provender of the horses. A crane, which can be protruded at pleasure, is usually placed within one of the upper windows; and I have frequently seen the trusses of hay, and the sacks of corn, slowly drawn up to the top of the superb residence of a duke or a prince.

The leading street in Paris, on a par with the Strand and Fleet-street in London, is the Rue St. Honoré, which is joined to the Rue St. Antoine, forming a complete line from east to west; while from north to south is Rue St. Martin, which conducts to the Seine at the Pont (bridge) Notre Dame, and on the opposite bank is continued by the Rue St. Jacques, forming one uninterrupted course through the whole city. On a parallel with these two last-mentioned streets is the Rue St. Denis, which leads to the Pont au Change (Exchange-bridge), and on the other side of which is a continuation by the Rue de la Harpe, and the Rue d'Enfer, (Road to Hell.)

The lamps, instead of being close to the houses, are hung by a cord across the middle of the streets, high enough for carriages to pass beneath them. They put us to shame during the reign of our degenerate lamps; but, since gas and clean lamps have been introduced among us, we rank above the Parisians in that article of comfort, as we do in most others. The names of the streets are written in large characters at the beginning and end of each, with this peculiarity, which will often be a useful guide to the stranger: the names of the streets which are parallel with the course of the Seine are painted in red letters; those which are perpendicular to the Seine are black. The numbering of the houses is likewise peculiar: the numbers begin with that part of the street which is nearest to the Seine; or from the east, when the street is parallel with the river: the even numbers are on the right side, and the odd numbers on the left side, of the street.

Hackney-coaches ply in the streets from five in the morning

morning till midnight. They are in every respect much better regulated than those of London. The coaches and horses are good, and the drivers civil and honest. The numbers are painted on each side of the coach, and on the back, in large and legible characters; but this is not all; they are also painted on tin, and nailed up inside the vehicle in two or three places; an example worthy of being followed in England. The fares are regulated by the police, and are for a *cabriolet* 25 sous for the course; that is, for every time the vehicle is stopped. If taken by time, the price is 30 sous (1s. 3d.) for the first hour, and 25 for every following one. For a coach (*fiacre*) the price is 30 sous per course, or 2 francs (1s. 8d.) for the first hour, and 30 sous for the others: but the price is double, if the coach be taken after midnight. It is usual to give the coachman some money for drink, but he cannot demand it. There are in Paris about 2800 *fiacres* and 4000 *cabriolets*. The *cabriolets* are single-horse chaises with a head constantly up. They contain two persons and the driver: are exceedingly convenient, and have the numbers painted in the same conspicuous way as on the *fiacre*. The first hackney-coaches were established at a house in the rue St. Antoine, which had for its sign the image of *St. Fiacre*, whence the name.

The traveller should be informed that the regulations respecting the fare extend only to the barriers; and that, should he prolong his drive beyond them, he will be completely at the mercy of the driver, unless he has previously made a specific agreement with him.

Other *cabriolets*, and carriages of various descriptions, stand in different parts of Paris, and carry passengers to the villages in the environs. There is no fixed price, but the competition keeps it sufficiently moderate. On festivals, however, advantage is taken of the eagerness of the Parisians, and the fare is considerably enhanced.

There are also passage-boats, which depart every hour for Meudon, Sevres, and St. Cloud. A boat likewise starts every day for St. Cloud, from the foot of the Pont Royal. The passage occupies about two hours; the company is usually above the lower class; and the scenery of the river is delightful. The fare is 16 sols. The watermen are forbidden to take more than sixteen persons.

At all hours of the night persons are seen in the streets of Paris with torches or lanterns: these are called *fallots*; and are regularly appointed and paid by the police. Their principal office is to observe the actions of suspected persons; and they deliver a faithful bulletin, in the morning, of every thing that has taken place during the night. To the stranger they offer material assistance. If he should have lost his way at night, when no *fiacres* are on the stands, he may confidently commit himself to the care of one of these men, who, for a trifling gratuity, will conduct him the nearest way to his hotel. He should, however, be careful that there is nothing suspicious in his appearance or manner; for immediate intelligence of the hotel to which he has been conducted will be given to the police, and he may possibly be roused by a domiciliary visit before morning.

The soil on which the city of Paris stands is various. On the south of the river it is calcareous free-stone, frequently intermixed with shells; while on the north, as far as the streets that rise in the skirts of Mont Martre, it consists of alluvial sand to a considerable depth, followed by the gypsum of Mont Martre. "It is," says Mr. Pinkerton, "a well-known singularity in geology, that the banks of the rivers are often composed of different substances, owing, probably, to some natural incoherence, which afforded an easier course for the water to penetrate." The fossil bones found at Mont Martre are, by Cuvier, supposed to belong universally to different species and sizes of an animal now extinct, but approaching nearest to the tapir of America; and the sea-shells, some of them unknown at present in the Atlantic, discovered at Grignon, to the west of Versailles, in a bed of

sand under a layer of solid lime stone, indicate changes in the globe which it is impossible to account for.

The climate of Paris differs from that of London in the superior heat of the summer, which matures the grape in the open vineyard, a circumstance totally unknown in England. The general warmth of the year is much the same at Paris as at London, the superior cold of the winter balancing the heat of the summer. In the winter of 1802-3, the river Seine was frozen over during a fortnight, and the cold was intense. Pinkerton says, that he always thought that the environs of Mont Martre were colder than any other part of Paris, not only from the greater height of the situation, but from the proverbially cold nature of the alabaster. The clearness of the air is a circumstance very striking to a person who, after a long residence at Paris, returns to London. While the latter is enveloped in clouds of smoke, none is perceivable at the former, except at the moment of lighting the fires in the morning; and a spectator from a neighbouring eminence is dazzled with the white splendour of the houses and towers. The Parisians have an universal prejudice against the use of coal, which they conceive to be very unhealthy, and hurtful to the lungs. The smoke of wood, though more prejudicial to the furniture, the colour of which it soon changes, is yet scarcely visible in the open air, while that of coal blackens the surrounding objects, as appears but too certainly from the dark hue of our London churches and other stone buildings. The Parisian edifices, on the contrary, are of such dazzling whiteness, that in the summer the eye is fatigued, and seeks for the repose of some milder colour.

It has often been made a question, whether Paris or London is to be reckoned the finer city; according, however, to a well-informed traveller, London is said to be the more imposing to the eye as a whole, but Paris will better bear dissection. The wide streets and broad foot-pavements in London give a general impression of grandeur; but the public buildings that can be noticed as really fine ones are few. At Paris, while the city does not give an impression of grandeur as a whole, the objects which, taking in detail, claim particular attention, are grand and numerous.

Mr. Sals is very eloquent on this subject: "There is no modern city," says he, "that can boast of such a succession of magnificent squares, streets, and buildings, as Paris. Beginning with the Palais Royal, you cross the Rue St. Honoré to the Palais des Arts et des Sciences; whence, you pass through the Place de Carouffel, to the triumphal Arch of Bonaparte, on which were placed the bronze horses now at Venice. Going through the centre of the Tuileries, you enter upon the gardens, adorned with statues, fountains, walks, &c. On the right of the gardens is the Place Vendôme, with the Column Napoleon; on the left the Seine, whose stream flows slowly on, lingering as if it regretted leaving so delightful a place. Still advancing, you arrive at the Place de la Concorde; a magnificent range of buildings is seen on the right; the Champs Elysées in front, and on the left the fine Pont de la Concorde. Crossing the bridge, you find yourself opposite the beautiful palace of the Corps Legislatif, behind which is l'Hopital des Invalides, and near it l'Ecole Militaire. The next grand object which presents itself is the Champ de Mars, at the further end of which is the classical Pont de Jena. On the opposite side was to have been the palace of the King of Rome, for which an immense space had been cleared; nothing, however, except the foundation, is visible. All these places form an unbroken scene of magnificence and grandeur. Distributed about the Fauxbourgs St. Germain and St. Marceau, are other objects equally interesting. Such are the Musée des Petits Augustins, Luxembourg Palace and Gardens, St. Sulpice, the noble and elegant pile of the Pantheon, the Catacombs, the Observatory, the Gobelins tapestry, and the Jardin des Plantes. Crossing the iron bridge of Austerlitz, you arrive at the foundations of the Hall of Abundance,

dance, begun by the order of Napoleon, but now left to decay, like many other fine works which were in progress when the Bourbons returned. Proceeding by the fossée of the Bastille to the fountain of the Elephant, likewise unfinished, you arrive at the beautiful fountain of the Lions, and the best part of the Boulevards.

"Such a succession of pleasing objects, united to the civility with which you are received; the prevailing urbanity and politeness of the inhabitants; the music and singing which charm your ear, the drollery of the *grimaieurs* and mountebanks, which irresistibly excite you to laughter; the bustle, the activity, and the vivacity seen around, all conspire to create that feeling of delight and ecstasy which is seldom felt in our own country. The comforts which attend the walks of the sensualist are great. If he be warm, he can retire to a delightful shade; and command ices, lemonade, and punch of the most delicious kinds. If he be hungry, the most luxuriously cooked meats await his order: amusements of all kinds surround him; and almost every wish his heart can form, is within his reach."

Mr. Sals is in such good humour with the French in general, that he draws a parallel between them and the Italians, which we are tempted to transcribe.

"Italy and France still resemble each other in some particulars, which may have arisen from their long intercourse, and having been under the same government; but in most things, at the present moment, they are widely different. The French are proverbially honest; the Italians directly the reverse. There is a neatness and cleanliness in the French; and, although they cannot be compared to the English in these particulars, they are greatly superior to the Italians, who are in general very filthy. The country of France is richly cultivated, whilst a great part of Italy is a desert. Where it is to be got, the dressing of the food is very similar; but, in travelling through some parts of Italy, the visitor must not be very fastidious, but content himself with four bread, bad cheese, and indifferent wine. The French are lively and industrious: the Italians add cunning to their liveliness, and are extremely indolent. If extreme poverty is seen in France, the most abject misery and wretchedness are met with continually in the other country. The system of police is so good in France, that you travel in perfect safety in every part; whilst, in Italy, your property is in continual jeopardy, nor is your life ever secure. In fact, to compare the government of Italy with that of France, we may almost give the latter the appellation of paternal. In the conveniences of travelling also, in these two countries, there is a great difference. A person may be conveyed in safety and comfort, by the diligences, to all parts of France; or, if he has a carriage, can travel equally so by post. In Italy, there being no regular conveyances from one part to another, the difficulty of getting to any particular place is great, unless you have a carriage of your own: and you are then subject to every species of villainy and extortion, without the possibility of getting any redress; besides the continual hazard of being attacked by the distressed and infuriated rabble, who infest every part of Italy. Indeed, without an escort of cavalry, travelling is avowedly dangerous; and, on the other side of the Apennines, a guard of this kind is absolutely necessary. By the intelligence lately received from Italy it appears, that the audacity of the bands of robbers has arrived to such a pitch, that they not merely rob and murder travellers, plunder the villas in the vicinity, and brave the gates of Rome, carrying off prisoners and then demanding their ransom, but even enter that city in large bodies, and threaten its inhabitants. Turkey, a government we despise for its imbecility, is not so bad as this. From good authority, I know that we can travel there in comparative safety."

But, to keep more closely to the subject of the present article, we must speak particularly of the

Character and Manners of the Parisians.—The inhabitants of every great city may be divided into three classes,
VOL. XVIII. No. 1256.

of whom the character and manners are altogether dissimilar; the noblesse, the middle ranks, and the common people.

1. The manners and habits of the noblesse have materially improved. The strange vicissitudes of the last thirty years have sobered down much of their peculiar and disgusting levity. The character and habits of the present reigning family, and the degree of uncertainty which yet attends the political situation of France, have given a serious, but not an unpleasing, cast to the natural cheerfulness and buoyancy of spirits. The necessity of the times has likewise taught them affability, condescension, and an apparent interest in the welfare of the middle and lower classes. The morals of the noblesse are likewise evidently improved; and the shameless exhibition of profligacy which disgraced the reigns of Louis XIV. XV. and XVI. are now seldom witnessed.

2. The peculiarities of the middle ranks of society, who will principally offer themselves to the attention of the traveller, with whom he will have most to do, and to whom he must look for the true character of a people, are easily described. The most prominent feature in the character of the Parisian is a peculiar *politesse*, which rarely fails to please, though it is not always exempt from hypocrisy.

3. Brutal battles, quarrels, and noisy drunken fellows, are very seldom to be met with at Paris; nor is the traveller so often afflicted and disgusted with the sight of female profligacy as in England. The lower classes of the people behave to each other with a surprising degree of civility. The advantages of what is called a common education are universally diffused; and a taste for reading, for accomplishments, for all the embellishments of existence, is a general characteristic. The peasants have it, and in almost as high a degree as the most cultivated persons. The poorer orders are polished far beyond the corresponding classes of the English, and the effect of their behaviour is extremely pleasing. One is chiefly surprised by the propriety of their mode of speaking: the ceremonies of courtesy, and the idiomatic phrases of politeness, proceeding from milk-women and carmen to each other, rather amaze an Englishman. The lowest persons touch their hats to each other in the streets.

Civility and good manners indeed may be traced, though in different proportions, through every rank; yet it has been remarked, that much of that anxious politeness which existed before the revolution has been exchanged for a more sedate manner, and a feeling of independence. The company of the foster sex is too often neglected for the gaming-table and the theatre; and the chevalier, who never quitted the company of his lady under the *ancien regime*, is a character unknown at Paris. The character of the men is, without question, considerably impaired: their levity and frivolity, and their good temper also, we say with regret, have, in many instances, given way to a less amiable demeanour.

A military impulse (observes a good writer) had been given to the nation in the very earliest stages of the revolution; and the republican motto, "Peace to the cottage, and war to the castle," had opened every country in Europe to the arms and the rapacity of the French soldier. But the military system received its full perfection from the genius of Bonaparte; he interwove it into all the institutions of the country, into all the offices of life, into all the operations of government, and even into all the intercourse of society. Prints and pictures, songs and stories, shows, exhibitions, and amusements, all were employed as vehicles of this spirit; and it would have been wonderful indeed, if, accompanied by so many victories abroad, and by so many pageants at home, it had not become the prevailing taste of the nation, and if France itself had not been converted into a camp, and every child a soldier. We are sorry to see a fondness for military parade and military habits so prevalent in our own country: no dress but a military uniform is acceptable at the British court.

The wonderful successes of our armies will no doubt reasonably account for this; but we hope that mutual confidence and a long peace will by degrees soften down these habits in both countries, and particularly in our own. See Lord Grey's speech on the opening of parliament, Jan. 23, 1821.

It has been said, and perhaps with some justice, that *hospitality*, formerly the natural virtue of Frenchmen, is no longer to be found in France: and this is particularly the case in the capital. The fondness for public amusements, and spectacles of every sort, leave the Parisian but little time to cultivate the pleasures of domestic society, or to exercise the virtues of English hospitality. The people of Paris are seldom *at home*, even in the technical language of modern times; and, as a great majority of them breakfast, dine, and sup, at coffee-houses and restaurants, the stranger cannot expect that much attention will be paid to letters of introduction, so far at least as hospitality and domestic society are concerned.

The Parisian, though he has little idea of what we term the comforts of the domestic fire-side, does not, at the close of the business of the day, quit his family and resort to the coffee-house, or the club; but with his wife and children, dressed in all their little finery, he parades the Boulevards; he visits some of the numerous gardens with which the metropolis abounds; he treats himself and them with the cheap pleasures which these places afford; and usually closes the evening with either joining in the dance, or gazing with delight on the graceful movements of others. The cheapness of provisions in France, and an economy in dress and living scarcely known in England, enable him to make almost every evening a season of festivity. It may be truly said drunkenness is nearly unknown. A tumbler of lemonade or orgeat is frequently the whole of the Frenchman's debauch.

A passion for *gaming* lamentably pervades the middle classes, and those especially of an intermediate rank, between the bourgeois and the noble. The spacious apartments of the Palais Royal are daily crowded. Men and women promiscuously assemble, and enter into the dangerous business of the gaming-table with all the energy of their national character. Different rooms are suited to the finances of every speculator. The mechanic who can only stake a single franc, the hardly-earned produce of a laborious day, is not excluded. The Palais Royal may be termed the spot where the demon of gambling holds his principal court; but in every district of Paris, and almost in every street, the unhallowed but legalized assemblies of his votaries abound. It is said that the government of Bonaparte derived the enormous sum of 600,000*l.* per annum from the licenses of the gaming-houses; and the present government does not disdain to avail itself of this disgraceful and pernicious revenue.

A fondness for public amusements is however a principal feature in the French character. It is not less strange than true, that even the anarchy and bloodshed, which disgraced the early stages of the revolution, were not sufficiently revolting to restrain this love of diversion. At the close of every day that had witnessed the guillotine performing its murderous office, no less than thirty theatres, independent of other places of amusement, were as uniformly crowded as if the most perfect tranquillity had reigned in the capital. The principal day of amusement is Sunday. After he has heard mass, the best catholic gives himself up to enjoyment. Music and dancing are heard in every street, and the theatres are literally crowded. The commercial man too frequently disregards the sanctity of the day; his shop and his counting-house are open as usual, and he is as eager to buy, and sell, and get gain, as on any common day. Soon after the present king was first seated on the throne of his ancestors, he published a decree, in which he ordered the shops to be shut on Sunday. Reasonable and proper as was this injunction, it gave great offence, and materially contributed to alienate the affections of the Parisians. The decree

has been revived, but it is far from being universally obeyed.

The French have been accused of dishonesty in their commercial transactions, and especially with foreigners. If this be meant to apply to the principal merchants and bankers of Paris, the charge is utterly false. In the strictest integrity, in all their dealings, and the nicest sense of honour, these gentlemen are not inferior even to the merchants of Britain. If it be applied to the *boutiques* of the Palais Royal, the charge is partly true, and partly unfounded. The tradesman of the Palais Royal will unblushingly demand considerably more than the value of his commodities. He will omit no finess, he will spare no misrepresentation, to obtain his price. Yet with this is mingled an honest principle, which the tradesmen of all other countries will do well to imitate. Should the traveller inadvertently leave his gloves, or even his purse, on the counter, a messenger is immediately dispatched after him, or the articles are preserved with religious care until his return. A recent traveller, who has drawn the most impartial portrait of French manners extant, records the following anecdote: "One of our party entered a small shop in the Palais Royal, to buy a travelling cap. The woman who attended him, asked sixteen francs for one which was certainly not worth more than six, and which she at last gave him for seven. Being in a hurry at the time, he inadvertently left on the counter a purse containing twenty gold Napoleons. He did not miss it for more than an hour; on returning to the shop, he found the old lady gone, and concluded at first that she had absented herself to avoid interrogation; but, to his surprise, he was accosted immediately on entering, by a pretty young girl, who had come in her place, with the sweetest smile imaginable, "*Monsieur a oublié sa bourse; que nous sommes heureuses de la lui rendre; Sir, you forgot your purse; we have a great pleasure in restoring it.*"

In our sketch of Parisian manners, the fair-sex must not be omitted. In France more than in any other country, the empire of woman is apparently established. The records of the nation demonstrate that her fascinations, her virtues, or her foibles, have influenced and governed almost every political event. In private life she bears a prominent part in every transaction, and universal homage is paid to her charms. At every place of public entertainment, she presides. She sits enthroned in the café, and more particularly occupies the attention of the visitors than the most interesting or important news of the day. Even in the baths, it is a woman who must administer refreshment to the swimmers, although their scanty covering is scarcely an apology for decency. In the shop of the tradesman, the female presents herself to every customer, and superintends the whole concern, while the husband lounges over the counter, or amuses himself at the café. In the name of the wife every guest is invited, and to her discretion every domestic arrangement is implicitly submitted.

When, however, we penetrate into the recesses of private life, we perceive that the female rules every-where but in her native empire, the heart of her husband. She governs every thing with absolute sway except his affections. In these it is said she often yields to a happier rival; and, to retain the semblance of dominion, which she can no longer exercise over her liege lord, she listens to the protestations and vows of another suitor. It is notorious that conjugal infidelity is too prevalent in every class of society. The husband does not attempt to conceal his attentions to another female; and the wife, even in the presence of her husband, listens with complacency to the adulations of her *cicibeo*. If these arrangements are not invariably criminal, they cannot fail of being dangerous; and the influence of this unnatural state of society is too apparent. It gives to the character of the most virtuous and accomplished woman a confidence not suited to the English taste, and not favourable to domestic felicity; and, to females of inferior minds, and laxer principles,

ples, it imparts a total want of delicacy, at which the stranger will often wonder.

The young unmarried ladies in France are completely exempted from the charges just mentioned. The strictness of the general system of education there, prevents the possibility of such indecorum. They marry, therefore, not to give up their liberty as in England, but to gain liberty. Hence they marry young; and nothing is more common than a match between a girl of 16 and a man of 36.

Mr. Holcroft says, "I have heard it maintained by Frenchmen, and I greatly fear with truth, that the number of public women, according to the population of the two cities, much exceeds in London that of Paris; and the reason they say is, that the practices of gallantry already described are so much better *understood* in the latter city. May the knowledge never spread! Of the two evils, great as is the least, it is better to suffer public prostitutes than that our wives, our sisters, and our daughters, should be their avowed substitutes."

After all, it has been asserted by more than one good writer, that the French ladies are more formed for friendship than for love: "A French woman at thirty (says the author of 'Paris as it was and as it is') makes an excellent friend; and, attaching herself to the man she esteems, thinks no sacrifice too great for the advancement of his interest, or the security of his happiness or his reputation."

In one article of personal decoration an evident reform has taken place among the females of Paris. Rouge is no longer applied with an unparfing hand. The French women are generally brunettes; and many of them possess that peculiar and sparkling complexion, which is often more captivating even than the delicate and transparent skin of the northern fair. These nymphs have at length apparently learned to rely on the superior power of their native unassisted charms; and others, to whom Nature has not been equally kind, now apply the roseate hue of art much more lightly than some of the fashionable belles of other countries. That this is not a mere freak of fashion, but a permanent improvement in taste and manners, may be concluded from the fact, that the first dawns of it were noticed by Mr. Holcroft in 1802.

Having thus given a rapid sketch of the history and present state of this magnificent city, and the manners of its inhabitants, we are tempted to enter into a more particular description of its palaces, public buildings, literary and charitable institutions, &c. The numerous publications which have issued from the press, for the instruction of travellers, since the memorable year 1814, will furnish us with ample materials; our only trouble will be selection and arrangement; but it is right that we should acknowledge before-hand our obligations to two works in particular; Tronchet's Guide to Paris, and Planta's New Picture of Paris. Other sources of information will be noticed at the end of the article.

PALACES AND OTHER PUBLIC BUILDINGS.

THE TUILERIES.—The Palais des Tuileries was so called, because a tile-kiln formerly stood on the site where it is erected. At that time, this part of Paris was not comprised within its walls; and nothing was to be seen in the vicinity of the tile-kiln, but a few coppices and scattered habitations. In 1519, we find a little chateau standing here, which belonged to the duchess of Angouleme, mother of Francis I. This was removed by Catharine de Medecis, and the construction of the Tuileries was begun by her, in May 1564, after Charles IX. had destroyed her former residence the Palais des Tournelles. The present superb palace consisted, at first, of only the large square pavilion in the centre of the two piles of building, which have each a terrace towards the garden, and of two pavilions by which they are terminated. Henry IV. enlarged the original building, and in 1600 began the grand gallery which joins it to the Louvre. Louis XIII. made some alterations in the palace; and,

in 1644, Louis XIV. directed it to be finished, by making the additions and embellishments which have brought it to its present state. The front now consists of five pavilions, comprising that in the centre; with four ranges of buildings connecting them together, and forming one grand façade. Every order of architecture is rendered subservient to the embellishment of this magnificent edifice: but the Ionic pillars on the right of the terrace particularly captivate the eye by their beautiful proportion and exquisite workmanship.

Originally, the large pavilion in the centre consisted only of the Ionic and Corinthian orders. To these Louis XIV. added the Composite, and crowned the building with an additional story. This pavilion, whether viewed from the court or the garden, presents a beautiful specimen of architecture. The whole façade is adorned with Ionic pillars, placed on pedestals. Above these, on the three centre pavilions, and the piles of building which connect them, appears the Corinthian order, over which is the attic story of the palace, surmounted by a balustrade. The balustrade of the pavilions at the extremities is surmounted with elegant stone vases. The two other ranges of building, with the pavilions which terminate them, are adorned with fluted columns of the Composite order. The pillars are all formed of superb brown-and-red marble. The portico of the centre pavilion towards the court is peculiarly beautiful, the ground-floor is decorated with columns of the Ionic order, and on either side of the gate are exquisite antique statues of Apollo, Moneta, and a Faun. Above are superb columns of brown-and-red marble, of the Composite order, supporting a triangular pediment. In the centre is the clock of the palace, and below are two recumbent statues of Justice and Prudence. The portico towards the garden is similarly ornamented, but the columns are not constructed of marble. The niches on each side of the vestibule are decorated with antique marble statues of Mars and Minerva; and on either side of the gate is a lion of white marble with its foot on a globe. On the galleries are eighteen marble statues of Roman senators clad in the toga, and in other parts of the façade are twenty-two busts of Roman emperors and generals.

Though each part taken separately is beautiful and perfect, it is much to be regretted that so little unity of design prevails. We plainly reckon five different orders of architecture, and five distinct species of ornament succeeding each other without connection and without harmony. The transition from the second pavilion to the range of buildings beyond it, is likewise extremely harsh and abrupt. The extraordinary height of the roof in the front towards the garden has likewise been censured by some architects. It gives an air of heaviness to the whole façade, which the relief of the beautiful colonnade, enriched with numerous vases and statues, cannot altogether remove.

The interior of the palace possesses every thing that riches, luxury, or taste, can supply. Its magnificent vestibule is ornamented with three statues; opposite the grand staircase is a Minerva; to the right an Affranchie, or freed-man; and to the left a Rustic. Traversing several apartments of state, we arrive at the Salle du Trône, the beauty of which is unequalled: behind this are his majesty's private apartments; and on the middle story those of the duchess d'Angouleme. The count d'Artois resides in the pavilion de Marfan; and the duke de Berry occupied the first apartments in the royal gallery, which looks towards the Rue St. Honoré. The council of state is held in the Gallery of the Museum; and the chapel is on the right of the edifice proceeding up the *escalier d'honneur*, or grand royal staircase.

An iron palisade, erected on a wall two feet in height, encloses the coach-yard of the palace, and divides it from a fine street which leads to the vast Place du Caroussel: this was formerly obstructed by mean buildings, which concealing some parts of the noble façade, it was necessary

to take them down, to give full effect to the view of a palace, the embellishments and beauty of which majestically announced the dwelling of the French kings. This improvement was made by Bonaparte. There are fine galleries on each side, which communicate with the Louvre. In the vast area here, fifteen thousand cavalry and infantry have performed their evolutions when paraded or reviewed. The triumphal arch, which forms the principal entrance to the court of the Tuileries, was built by Napoleon on the plan of that of Septimius Severus at Rome; nor is it inferior to its celebrated original. It is sixty feet wide, and forty-five feet high. The centre arch is fourteen feet wide, the others eight and a half. Each front is decorated with four columns of the Corinthian order, supporting marble figures, representing different soldiers: towards the palace are a Grenadier, a Canonier, a Carabinier, and a Pioneer; on the other side are a Cuirassier, a Dragoon, a Carabinier, and a Chasseur. Four bas-reliefs adorn the attic. On the outside are, on the right, the arms of France, supported by Peace and Plenty; and on the left, the arms of Italy, sustained by Wisdom and Strength. On the side towards the palace are the same arms, accompanied by divers attributes of the Arts and Sciences. Four other bas-reliefs are over the smaller arches, representing, on the side towards the palace, the entry of Munich, and the interview of the two emperors; and on the other side, the battle of Austerlitz and the capitulation of Ulm. Over the centre arch, in a triumphal car, was the statue of Napoleon. The bronze horses were the celebrated productions of Lysippus, which formerly ornamented the square of St. Marc at Venice, and which had before adorned the arch of Nero at Rome. This group, which had a picturesque effect, and well terminated a building remarkable for the elegance of its proportions, the happy arrangement of its different parts, and the inimitable execution of the whole, has disappeared. The horses have been restored to their rightful owners; and the statue of Napoleon has been hurled to the ground.

The Garden.—This, in the time of Henry IV. was separated from the palace by a street, and was nothing more than an orchard planted with fruit-trees, particularly the mulberry-tree. Rich in the beauties of nature, it wanted nothing but the assistance of art. Louis XIV. accustomed to impress the character of greatness upon every thing about him, ordered le Nôtre to lay out the garden upon a parallelogram of 67 acres, and on a scale worthy the residence of a sovereign. The unity of the plan and the variety of its details are truly admirable; the ornaments are judiciously distributed, and the statues tastefully displayed. The jets d'eau and their basins, encircled with groups of statues, and orange-trees, are delightful. There is a large terrace, ascended by three steps, in the front of the palace; and terraces planted with low trees extend on both sides of the garden, and terminate in the form of a horseshoe at Pont Tournant, from whence there is a charming prospect of the navigation of the Seine, the road from Versailles, and the perspective of the fine hotels about the Quai d'Orsay and the Champs Elysées. The Feuillans, no longer disfigured by a dreary wall, has a fine grating surmounted by gilded points: here is a fine view of the superb street de Rivoli and the uniform porticos of its houses. At a distance is seen the Place Vendôme, its triumphal column, and the Boulevards; each of these terminates towards the Place Louis XV. in delightful groves, and a double row of seats for the accommodation of persons who enjoy the fêtes frequently given here. In traversing the grove, it appears to be an avenue upon the same line with the Elysian fields and extending as far as the barrière de Neuilly, where the view is closed by the rising ground and the new triumphal arch.

The triumphal column, in the Place Vendôme, which we have just mentioned as being visible from this place, was erected by Napoleon, in the room of a bronze eque-

trian statue of Louis XIV. which stood in the middle of that fine square. This statue, which was melted, together with many other monuments of the art of casting in metal, by the irresistible heat of the revolution, was executed by John Balthazar Keller in December 1692. The height of it was 20 French feet; the weight 70,000lbs. of metal; and it is reported that twenty men might easily have sat at table in the belly of the horse. The pedestal was of white marble, 30 French feet in height, and 24 in length. It was the finest statue that had ever been cast in honour of the grand monarque. The superb monument, to the honour of the French armies, which now stands on the spot, is formed on the model of Trajan's pillar at Rome. Its elevation is 123 feet, including the pedestal. The height of the pedestal is about 22 feet, and from 17 to 20 in breadth, corresponding with the cornice; the base of the shaft is about twelve feet in diameter. It is entirely covered with brass, furnished by the artillery taken from the Austrians by Bonaparte. The pedestal is filled with bas-reliefs, composed of trophies of arms of every kind, and at each angle is an eagle grasping a crown of laurel. At the foot of the column commences another set of bas-reliefs, which trace in chronological order the principal events of the campaign of 1805, from the breaking-up of the camp of Boulogne to the conclusion of peace after the battle of Austerlitz. These bas-reliefs, which ascend in a spiral direction, are composed of 276 plates, about three feet wide and four in height, which are joined together in an irregular manner, according to the disposition of the figures. A spiral line separates each row, and bears the name of the action which each division represents. On the summit of the column, as on that of Trajan, is a gallery, the ascent of which is by a spiral staircase in the centre of the pillar. Strangers are not now permitted to ascend to the gallery, in consequence of an accident which occurred there some time ago. It commands a fine view of Paris. Above the gallery is a small dome, on which were placed the statue of Napoleon. This, however, has disappeared, and the white flag floats in its stead.

This column was constructed under the direction of M. Denon; Lepere was the architect. It was begun in August 1807, and completed in August 1810.

The parterre in the front of the palace extends 120 toises, and is ornamented with three basins and fountains; all the walks appear not only useful but necessary, and all lead to the groves or to water. Four lawns cut into triangular shapes appear before each of the wings of this palace, planted with trees and flowers, and enclosed within iron railing. The circuit of the large basin and the front of the grove are ornamented with marble groups, vases, statues, and orange-trees. Beyond the wood in a circular space is the great octangular basin. The magnificent figures of two winged horses embellish the entrance through the handsome iron gate of this garden; and numerous chefs d'œuvres of sculpture, bronzes, and casts, are every where met with throughout the walks.

The gardens of the Tuileries are always open to the public, and are the principal promenade of this part of the town. Here the beaux and belles assemble, in a summer's evening, to walk or to sit down, and form *conversazioni*. It is a privilege granted to one particular person to have chairs to let for this purpose, for which the hirer pays two sous, or a penny English, for the evening. Hither also politicians resort in the morning to study the newspapers, which are furnished by the proprietor of the chairs, the hire of them being charged the same as the hire of the chairs, two sous each. A grove of horse-chestnut trees furnishes a fine shade, under which these studies can be pursued without any inconvenience from the scorching rays of the noonday sun.

To those who are fond of military music, a morning ramble in these gardens is truly delightful, as the band belonging to the corps that mounts guard at the Tuileries always plays from eleven till twelve o'clock. In the summer,

Eastern Front of the Louvre.

summer, one walk which runs the whole length of the garden is decorated with a range of large orange-trees, in cases on each side of it. Numbers of orange-trees and oleanders (rose-bay) are besides dispersed over different parts of the garden. When the palace and walks are illuminated, as is the case on fête-nights, they present a superb spectacle.

The LOUVRE—adjoins the Tuileries on the east by a gallery 1365 feet long. Much uncertainty exists respecting the derivation of the name of this magnificent palace. Some have derived it from *louve*, a she-wolf, because it was formerly surrounded by a thick forest, much infested by wolves. Others have derived it from the Saxon word *lowen*, a castle; and others with more probability, from the ancient Gaulic word *ouvre*, now written *œuvre*, signifying the beauty of its architecture, and equivalent to the modern expression *chef-d'œuvre*. It is the most ancient of the royal palaces. It existed in the time of Dagobert, when it was without the walls, and used as a country-house by the kings of France. Having been destroyed by the Normans, it was rebuilt by Louis the Young, and afterwards repaired by Philip Augustus, who surrounded it with towers and a moat.

It formerly contained an immense insulated tower in the centre of one of its courts, much celebrated in French history. In this tower all the feudatories of the crown were compelled to assemble at stated times, to pay homage to their liege lord, and to renew their oaths of fidelity; and the dungeons of this tower were their prison in case of disobedience or rebellion. This strange building gave to the whole of the palace so sombre an appearance, and so many sad and frightful histories were attached to it, and related of it, that many of the kings refused to make the Louvre their residence. Charles V. endeavoured to enliven it, and made it commodious for those times. Several foreign monarchs successively lodged in it, such as Manuel emperor of Constantinople, Sigismund emperor of Germany, and the emperor Charles V. The large tower, which, at different periods, had served as a palace to the kings of France, as a prison to the great lords, and as a treasury to the state, was at length taken down in 1528.

The part of the palace which at present is denominated the Old Louvre, was begun under Francis I. but was first inhabited by Charles IX. under whom it became the bloody theatre of treacheries and massacres, on the infamous St. Bartholomew's day, which time will never, and ought never, to efface from the memory of mankind, and which, till the merciless reign of Robespierre, was unexampled in the history of that country. In after-times this palace became the quiet and happy cradle of the arts and sciences, the school for talents, the arena for genius, and the asylum of artists and literati. The centre pavilion, over the principal gate of the Old Louvre, was erected under the reign of Louis XIII. from the designs of Mercier, as well as the angle of the left part of the building, parallel to that built by Henry II. The eight gigantic Cariatides, which are to be seen there, were sculptured by Sarrafin. The sides present three projecting buildings, adorned with beautiful sculptures: on the left are Mercury, Plenty, and two Genii; on the right, History writing, accompanied by the busts of Herodotus and Thucydides, and the statues of Peace, Victory, and Fame; between the pilasters are many Egyptian divinities, the statues of Numa and of Moses, and the representation of the principal events of the reign of Napoleon.

The part of the Louvre which, with two sides of the old building, forms the perfect square, about four hundred feet in extent, called the New Louvre, consists of two double façades, which are still unfinished. The front which it presents to the river is plain and noble. The eastern front is the famous colonnade, the noblest monument of the era of Louis XIV. An Italian artist named Bernini, and supposed to be the most skilful architect of

the age, was sent for at a considerable expense to erect it. He soon pretended that the climate of France disagreed with him: it was whispered that he found himself unequal to the task; and a physician of the name of Perrault undertook and completed it. It is composed of two peristyles, and three projecting buildings on the ground-floor, which form one continued basement. The lateral projecting buildings are adorned by six pilasters, and two columns of the Corinthian order, while that in the centre is composed of eight columns, and crowned with a pediment, on which is a bas-relief representing Victory in a car distributing crowns. Above is a triangular pediment, beautifully executed. The bust of Louis XIV. occupies the highest part: Minerva is placing it on a pedestal, and History is writing underneath LUDOVICO MAGNO. Well-executed figures of the Muses fill the remainder of the composition; and on one of the gates is the following inscription, *Dum totum impleat orbem*, "May it last till the owner hath extended his sway over the whole world."

The general appearance of the whole is indisputably grand and majestic. It is, however, open to much criticism. The substruction on which it stands is too high in proportion to the elevation of the colonnade. The pillars are coupled, which destroys the proportion between them and the intercolumniations. The shafts are too thin for their length; and the heavy masses at the ends and in the centre, throw an air of gloominess over the whole fabric. The architecture of the celebrated Gallery which connects the Louvre with the Tuileries is the same as that of the pavilions of the Tuileries, without the attic, but disfigured by numberless pediments, alternately triangular and curvilinear. Towards the middle the style changes; and, instead of the single Corinthian, three different and whimsical Composite forms are introduced, to the great detriment of the architectural appearance. Bonaparte, wishing to complete the square, began the communication on the opposite side, and had erected more than a third of it at the period of his dethronement. The work is still carried on. Up to the year 1813, 22,400,000 francs had been expended in improvements which it will require more than the same sum to complete.

The *Royal Museum*.—The whole of the Louvre forms a grand museum of art, and is the repository of numerous pictures and sculptures formerly scattered in various departments of France, and of some lately brought from different palaces, chateaus, &c. The performances of living artists and their pupils are exhibited every two years in a large gallery of the Louvre; and several learned men and eminent artists have apartments assigned to them in this palace.

This museum was lately the boast of Paris, and the wonder of the world. It contained almost every celebrated work of art that the continent of Europe possessed; and might be considered as a magnificent temple, to which every votary of taste would resort, and offer his adorations. But the establishment has been thorn of its principal glory. The imperishable remains of the genius of former ages, which it contained, have been restored to their former owners; the halls of sculpture, which were thronged to confusion with the *chef-d'œuvres* of Rome and of Greece, are nearly deserted; and the twelve hundred inimitable paintings of the great gallery were reduced to little more than two hundred and fifty. A list of all the curiosities, as they stood before the year 1814, may be seen in Tronchet's Guide to Paris, 3d edit. It cannot be perused by any Frenchman without emotion.

Let it not, however, be supposed, that the Louvre is deplored of every object of attraction. Many of the treasures of foreign states, indeed, of which they once boasted, are seen no more; but the paintings which adorned the numerous churches that were profaned by revolutionary barbarism, have found an asylum here; and every department of France has lately contributed something to render the gallery of the Louvre an interesting

and valuable museum. In its present state, it consists of 1104 pictures; and the gallery of sculpture consists of 355 fine specimens of the art, with various degrees of merit. The works of the noblest masters of the present French school all remain; and, in addition to them, the amateur may yet study some of the most exquisite performances of Albano, Berghem, Caracci, Champagne, Correggio, Cortona, Cuyt, Del Sarto, Dominichino, Guercino, Guido, Murillo, Raphael, Rembrandt, Romano, Rubens, Ruysdael, Salvator, Snijders, Teniers, Tintoret, Titian, Vandyck, Paul Veronese, and Leonardo da Vinci.

The first saloon presents a curious collection of the very earliest works of the French and Italian artists. The conception is sometimes strong, but the execution is strangely rude; yet these pieces are valuable, as showing the commencement of the art.

The next saloon contains the deservedly-celebrated battle-pieces of le Brun. They are some of the noblest performances of that excellent painter.

The visitor now enters the great gallery. It is impossible to convey an adequate idea of the effect formerly produced on the mind, on entering this magnificent apartment, 1365 feet in length, and crowded with paintings of the most eminent masters of every school. The apparently interminable length of the gallery continues to excite surprise, and the skilful arrangements of the paintings that remained, and of many others that have been added to them, certainly do not convey that feeling of nakedness and desolation which the stranger might expect, and which some travellers have described. Although the gallery has irreparably suffered in value, it has not lost so much as might be imagined in appearance. It must, however, be confessed, that the place is not altogether suitable to the purpose to which it is devoted. The light being admitted on both sides of the gallery, renders it difficult to find the proper situation to examine some of the performances; and, concealing all the nicer touches, displays nothing but the varnish of others: and, as this gallery is 1365 feet long, and only 30 broad, it exhibits a disproportion that is displeasing and tiresome to the eye.

The works of Nicolas Poussin were not eclipsed amidst the constellation of excellence by which they were surrounded; they are now brought into more prominent notice, and will not fail to please. The Israelites gathering Manna in the Desert is deserving of considerable praise; and a Sketch of the Rape of the Sabines will not be viewed without interest. The Judgment of Solomon will be deemed a yet more excellent performance; the fine expression of the face of the monarch is very striking. Superior to this is the Institution of the Eucharist; and the Deluge breathes the truest sublimity.

The dark broad character of most of the paintings of Valentine will please the instructed alone; but, in his Concert, the varied and striking expression of the performers, and the strong character of the soldier in the foreground, will make a deep impression on every spectator.

Philip de Champagne was one of the greatest ornaments of the Flemish school. Among the paintings which adorn this gallery, three will not pass unnoticed. The Institution of the Eucharist is one of his best works. The Apostles are said to be portraits of the anchorites of the Port Royal. The immense picture of St. Ambrose is equally deemed, by the connoisseur and the uninitiated, one of the noblest ornaments of the gallery. Its companion, representing the same Saint removing the bodies of the martyrs Gervais and Protasius, is scarcely inferior. The figure and countenance of the lunatic possess all the wildness of his supposed character.

Some paintings of Rubens display all that artist's excellencies, with a less than usual portion of his characteristic defects. His Diogenes looking for an honest man; and his Thomyris with the head of Cyrus, are his best.

Berghem has very few pieces remaining, but the gallery yet boasts of his chef-d'œuvre. It is a landscape diversified with masses of trees and rocks. The road presents

several travellers and cattle. A woman on horseback, to whom another female is presenting an infant, is admirably executed.

Among the excellent portraits of Vandyke, or Vandyck, that of Charles I. will be particularly distinguished. The most perfect work of Snijders is to be seen here. It represents different kinds of fruit and vegetables, with some squirrels, an ape, and a parrot.

The Italian school, lately so numerous, contains only a few specimens; but they are inestimable. The St. Jerome and St. Agnes, of Dominichino, are no more seen; but the Æneas, accompanied by his son Ascanius, bearing on his shoulders his father Anchises, will give a sufficient idea of the talents of this great master. The Adoration of the shepherds by Espagnoletto, is in his best style. Guido, whose works are yet as glowing and fresh as when they received the last touches of the artist, continues to enrich the museum with several admirable works. The Rape of Helen displays all his grace and expression: but his Hercules contending with Achelous, and killing the Centaur Nessus, surpass all praise. The Loves of Venus and Adonis, by Albano, are exquisitely beautiful, particularly the first piece, which represents Venus contemplating herself in a mirror. Annibal Carracci furnishes a painting of hunting and shooting, not inferior to his best works. Paul Veronese contributes his noblest performance, the celebrated Marriage at Cana. The Saviour is seated in the centre of an immense table, and at his side the Holy Virgin, who, having just pronounced the words, "There is no wine," is eagerly listening to hear the orders which he may give. On either side are the newly-married couple, who, as well as the numerous guests, are portraits of the great personages of the painter's time. A large group of musicians displays the portraits of all the celebrated artists of Venice. Paul Veronese himself appears habited in white, and playing on the violoncello.

The Witch of Endor raising the ghost of Samuel has all the grandeur and sublimity of Salvator Rosa. The Antiope, with Jupiter in the form of a Satyr, contains all that sweetness of expression, that refined beauty of the female form, and harmony of colouring, peculiar to Correggio. The Jesus on the knees of St. Anne, and the Jesus supported by an Angel, are pleasing efforts of the pencil of Leonardo da Vinci. Titian has many portraits with all his peculiar colouring; his Disciples at Emmaus is a splendid performance; but his Entombment of Christ is without a rival. The divine Raphael has two works remaining in the gallery; it is said that more will be added from other collections.

It would be impossible to enter into a description of the numerous pictures: we must refer the reader to the Catalogue, which has been translated into English.

The noblest productions of ancient sculpture crowded the halls of the ground-floor; but the restitution of every work to which the French could plead no better right than that of war, robbed "the Gallery of Antiques" of almost every valuable specimen, and left it desolate and naked. It has received wonderful accessions. The statues are now re-arranged; and the French have filled the sad and dreary void with the best works that other collections can spare, and with models of many of those transcendent pieces which are now lost to them for ever.

The entrance into the halls which formed the Gallery of Antiques is on the left of the stairs leading to the Gallery of Paintings. They are eight in number, each bearing an appropriate name.

First is the Vestibule; its ceiling, painted by Barthélemy, represents the origin of Sculpture, when the first statue was fashioned by Prometheus. The four medallions allude to the four principal schools of sculpture, Egypt, Greece, Italy, and France. The bas-relief over the entrance describes the Genius of Art; and that over the portal, leading to the first hall, the union of the three branches of design.

Next

Next to this is the Hall of the Emperors, whose ceiling is painted by Meynier, and represents the Earth receiving from the Emperors a code of law, dictated by Nature, Wisdom, and Justice. In two tablets of bronze, by the same artist, Trajan is seen planning the Roman roads, and erecting the aqueducts. The bas-reliefs at the angles are the Eridanus, the Tiber, the Nile, and the Rhine. This hall once contained the Minerva of Villettri, the Antinous, and Hercules, and the beautiful Tomb of the Muses.

The ceiling of the Hall of the Seasons was painted by Romanelli, and contains the history of Apollo and Diana. Here was the celebrated Indian Bacchus, the Venus coming from the Bath, and the Ariadne, surnamed the Cleopatra.

The Hall of Peace is decorated by eight antique pillars of granite, which formerly enriched the nave of the church of Aix-la-Chapelle. They were claimed by the Prussians; but it was found that they could not be taken down without serious injury, and some statues were given in exchange. The three allegorical paintings depict the Arts, Peace, and Commerce. Here were the exquisite statues of Zeno, Demosthenes, Trajan, Phocion, Menander, and Posidippus.

The ceiling of the Hall of the Romans is painted by Romanelli, and exhibits History and Poetry celebrating the successes of Bellona. Four other paintings represent the Deputies of the Senate offering the purple to Cincinnatus; the Rape of the Sabines; the courage of Mutius Scævola; and the Continnence of Scipio. This hall contained many rare specimens of the antique. Among them were the Germanicus, the Ceres, the Marcus Junius Brutus, the expiring Gladiator, the Antinous of the Capitol, the spotted Faun, the Tiberius, and the fragment of the colossal statue of Hercules.

The next apartment was called the Hall of the Laocoon, but now the Hall of the Centaur. Its ceiling contained the French Hercules conquering the fury of Party; the Arts celebrating the Victories of France; Study and Fame; and a Group of Genii. It is here that the traveller perceives the full extent of the retribution with which France has been visited. The inimitable and affecting Laocoon, the fascinating Venus de Medicis, the finely-modelled Cincinnatus, the majestic Jupiter, the spirited Meleager, the exquisite Cupid and Psyche, and the much-admired figure of the Youth extracting a thorn from his foot, are no longer to be seen.

Four columns of red oriental granite, taken from the tomb of Charlemagne, adorn the Hall of Apollo. The Belvidere Apollo, the sublime sculpture that has escaped the ravages of time, once occupied a conspicuous place in this hall. It was surrounded by the Belvidere Antinous, the Antinous of Egypt, the Ariadne of the Capitol, the Nurse of Bacchus, the Commodus Hercules, the Capitoline Juno, the Alexander Severus, the Alexander of the Capitol, the two Sphinxes, and the beautiful Candelabra.

The ceiling of the Hall of Diana represents her exploring Jupiter to permit her to remain among the number of the virgin goddesses: it is the performance of Prodhon. The surrounding paintings describe different events in the life of that deity. There is also the Hall of the Candelabra, the Hall of the Tiber, Hall of the Gladiator, Hall of Pallas, Hall of Melpomene, Hall of Isis, and the Hall of the Caryatides. Every work of art was swept from this beautiful hall. They have been replaced by a great variety of new subjects.

This museum is open to the public on Saturday and Sunday, from ten o'clock until four; but students and foreigners are daily admitted, on producing their passports.

In describing the public buildings of this city, we shall study contiguity rather than classification. The Tuileries and Louvre stand in the parish of

St. Germain l'Auxerrois.—The church was built by

Childebert; and the statues of himself and of his queen are yet to be seen at the entrance. The portal is a fine specimen of Gothic architecture, by Perrault and le Brun. The bell of this church gave the signal for the horrible massacre of St. Bartholomew. Before the Revolution, this church contained a collection of paintings and statues which almost rivalled the noblest museum in France. Most of the French artists lived in or near the Louvre. This was their parish-church; and a pleasing contention arose among them who should contribute most to its embellishment: Jouvenet, Coypel, Le Brun, Louis Boullogne, Philippe de Champagne, Coysevox, and Warin, were eager to place the most valuable of their works in the choir, and around the altar, of this church. During the sacrilegious period of the Revolution, these treasures were scattered or destroyed. Some of them are preserved in the Louvre.

The *Pont Royal*, or Royal Bridge, is situated opposite the Tuileries, and was erected by Louis XIV. to replace that of wood, which the breaking-up of the ice in 1684 had carried away. It is reckoned one of the most solid bridges in Paris; and, till the existence of the Pont Louis XVI. was the only one built across the river, without taking advantage of the islands. It stands on four piles, forming, with two abutments, five elliptical arches of a handsome sweep: the span of the centre-arch is 72 feet, that of the two adjoining 66, and of the two outer ones 60. On each side is a raised pavement for foot-passengers, and in the middle there is a space for four carriages abreast. The north end of this bridge faces that wing of the palace of the Tuileries which is called the Pavillon de Flore. From the middle of this bridge the city is seen in a most striking point of view. During the revolution, this bridge was christened *Pont National*; but its original name has been lately restored.

The *Place Louis Quinze*, or Square of Louis XV. separates the Tuileries from the Elysian Fields. It is of an octagonal form, surrounded by a fosse, guarded by a balustrade of stone, which is terminated by little pavilions in the form of pedestals destined to receive groups of figures. The centre of the Place Louis XV. exhibits one of the noblest views in Paris. In front is the palace of the Tuileries, seen through the grand avenue. Behind is the triumphal arch and *barrière de Neuilly*, seen likewise through the perspective of a long avenue. On one side the Rue Royale terminates with the new church of the Madeleine; and on the other side, the eye, glancing over the new bridge de Louis Seize, rests on the noble colonnade that forms the façade of the Palace of the Representatives. An equestrian statue of Louis XV. occupied the centre of the square.

On the 30th of May, 1770, the marriage of Louis XVI. then Dauphin; was celebrated here, but the day of rejoicing was converted into one of sadness and desolation. Through an oversight of the police, the streets leading to the place where the fireworks were exhibited were covered with heaps of stones. Some carriages ran against them in the dark, and broke down; they were left lying on the spot; others were overturned by them; the horses took fright, and plunged among the concourse of spectators on foot; who, urged by terror and alarm, pushed and jostled one another in the dark: numbers fell, and were trampled to death. The shrieks of the dying, the prancing of the affrighted horses, the thieves who purposely increased the crowd that they might rob the richly-dressed ladies of their jewels, all concurred to augment the horrible confusion. Whoever fell was lost; the terrified multitude rushed over him, and he expired perhaps under the feet of those who were anxiously seeking him, and would have sacrificed their own lives to save his. It was admitted, that upon this melancholy occasion 600 persons lost their lives; but credible eye-witnesses declare, that the number of sufferers, killed or dreadfully maimed, was not less than 1600. Next morning, half Paris was in mourning: almost every family lost relatives and friends; all halted to the spot

spot where the disfigured corpses were deposited, trembling lest they should discover in their countenances the well-known features of beloved objects.

Some have considered this calamity as a sad preface of the horrible scenes which were afterwards witnessed in this place! In September 1792, the statue of Louis XV. was overthrown, and the figure of Liberty erected in its stead. At the foot of this sanguinary altar the blood of Louis XVI. was shed; and, in the space of two years, many thousand of his subjects followed him to the same scaffold.

The name of *Concorde* was afterwards given to this square, to endeavour to efface the memory of the crimes by which it had been polluted. Its original title is now restored; but the space in the centre is at present unoccupied by any statue or public monument.

The *Garde Meuble*, or Wardrobe, adorns the north side of the square, and was built by Gabrielle, in 1768. On sub-basements, pierced by arcades, two peristyles elevate themselves, formed of insulated columns of the Corinthian order. Above the colonnade is a balustrade; and the whole front is richly embellished with the greatest variety of sculpture. Next to the Louvre it presents the most magnificent façade of any of the public edifices of Paris. Although many valuable articles which this fabric formerly contained became a prey to revolutionary fury, there still remain sufficient specimens to gratify the stranger's curiosity; particularly the Battles of Scipio, Oudry's hunting-pieces, the history of Don Quixote, and the polished armour worn by Francis I. at the battle of Pavia.

The *Pont Louis Seize*—communicates from the Place Louis XV. to the Quai d'Orfai. This bridge, which for some years bore the name of Pont de la Concorde, was begun in 1787, and finished in 1790. It is 462 feet in length by 48 in breadth. Like the Pont Royal it consists of five elliptical arches: the span of the centre-arch is 96 feet, of the collateral ones 87, and of the two near the abutments 68: under one of the latter is a tracking-path for the facility of navigation.

Contiguous to the Tuileries and to the Place Louis XV. are the *Champs Elysées*, or Elyian Fields; a noble, extensive, and regular, plantation of shady trees.—This vast enclosure was planted by Colbert in 1670, and extends from the Place Louis Quinze as far as Chaillot on the east, and to the extremity of the suburb of Roule on the west; the suburb of St. Honoré borders it on the north, and the Queen's Course on the south. Its principal walk extends from the Place Louis XV. to the Bridge of Neuilly; and its entrance from that square is ornamented by two pedestals supporting the figures of reftive horses by Cof-tou. Few parts of Paris afford a view comparable to that which this spot presents. In front is the Palace of the Tuileries, and its magnificent garden; on the left are the noble hotels of the suburb of St. Honoré; on the right is the river; and, behind, the picturesque barrier of Neuilly.

This vast extent of ground is planted with trees in various avenues, and composing different forms. The principal avenue of the Tuileries, on the side of the terrace of the Feuillans, is now the most frequented spot. Swings are erected in various places: numerous parties are at all hours joining in the graceful dance. The pavilions, or dancing-booths, are filled with bourgeois enjoying themselves after the labour of the day; and every kind of pastime is displayed for the amusement of the promenaders.

The *Cours de la Reine*, or Queen's Course, when the roads are not too dusty, is as pleasant a promenade as any that Paris affords. It is on the south of the Elyian Fields, and extends nearly a mile along the bank of the Seine, from the corner of the Place Louis XV. almost to the unfinished palace of the king of Rome. It was planted by Mary de Medicis, in 1628. The trees do not afford so much shade as might be expected; and in dry weather the dust is apt to be troublesome. There are four rows

of trees, twelve feet from each other, forming a grand principal walk, and two smaller ones.

The *Allée des Veuves*, or Widows' Walk.—An avenue of trees extending from that part of the Elyian Fields called l'Etoile, or the star, to the west extremity of the Queen's Course. It is crowded with tea-gardens, and is much frequented by the middle and lower classes of Parisians.

The *Barrière de Neuilly* stands on an eminence, and looks down upon that quarter of Paris which includes the Louvre and the Tuileries, with all their accompaniments, and indeed nearly all the beauty and magnificence of Paris. The barrier is formed of two very large and noble military stone lodges, having porticos on all sides, supported by massy Doric pillars; these buildings are separated from each other by a range of iron gates. Having thus insensibly, and almost unintentionally, led our traveller out of town, we must suddenly carry him back again, to the

PALAIS ROYAL, or Royal Palace; in the Rue St. Honoré.—The Palais Royal was begun by cardinal Richelieu in 1629, on the site which had been occupied by the hotels Mercœur and Rambouillet. The celebrated Le Mercier was employed as the architect. As the fortunes of the cardinal augmented, he enlarged on the original plan. It was completed in 1636; and its tout-ensemble, formed of successive additions, was a curious yet accurate representation of the growing wealth and power of its owner. It was then called le Palais Cardinal. At his death he bequeathed it to Louis XIII. He died in the following year, when his widow, Anne of Austria, quitted the Louvre, and established herself in this edifice with her young son Louis XIV. and his brother the duke of Anjou. From this circumstance it was called le Palais Royal, although the queen, from gratitude to the donor, caused the inscription PALAIS CARDINAL to be placed over the principal portal. The square, in front of the palace towards the street St. Honoré, was now completed.

In 1692, Louis XIV. gave it to his nephew, Philip of Orleans, on his marriage with Maria-Frances of Bourbon. That part of the building that reaches to the street Richelieu was now completed, and which the cardinal had destined as his library. In the right wing of the palace at this period, was an immense hall, capable of containing 3000 persons. The Italian comedians and the company of Molière performed here. On the same spot was built the opera-house that was burned in 1781. The left wing was occupied by a vast gallery, the roof of which had been painted by Philip de Champagne, and represented the principal events of the life of the cardinal. This was destroyed to build a residence for Philip of France, the only brother of the king.

In process of time it descended to the revolutionary duke of Orleans, Philip Egalité, to whom it is indebted for its present magnificence, and for its present disgrace. The front towards the street of St. Honoré was built by him after the destruction of the opera-house. It presents two pavilions, adorned with Doric and Ionic columns, and crowned with pediments. The buildings of the first court have Doric and Ionic pilasters, and Doric columns ornament the vestibule which conducts to the second court, where is another magnificent façade composed of two pavilions, with Ionic columns surmounted by a pediment. On the right of the vestibule is the grand staircase, which, although it is said to be deficient in some of its proportions, will excite the admiration of the spectator.

The present building is in the form of a parallelogram, and of the most elegant modern architecture. The parapet that surrounds it, decorated with immense stone vases of exquisite beauty, will not fail to attract attention. The whole of the circuitous extent, without any interruption of the galleries, is nearly half a mile. Passing under the porticoes, an immense square unexpectedly opens on the traveller. In the centre is a garden, interspersed with many young and flourishing trees, and encircled

circled by lattice-work. In the centre of this garden is a large circular basin with a beautiful fountain in the middle, erected by his present majesty Louis XVIII. and opened in March 1817.

Upon the whole, this is a building worthy of the name which it bears. It is indeed a *royal palace*, and worthy to become the residence of the sovereign of a great country. But the crimes of its former owner have rendered it a strange, unique, and disgraceful, scene which defies all description.

Having exhausted his noble revenues by a course of luxury and profligacy of which history scarcely affords a parallel, the duke of Orleans was driven to some desperate expedient to save himself from utter ruin. He determined to convert the residence of a prince into an immense bazar. The beautiful arcades of the lower galleries were divided by diminutive and ill-executed pilasters, and the garden was surrounded by a row of little shops, which were speedily let to the highest bidder. Had he stopped here he might have been forgiven; but, urged by avarice, or by the desire of obtaining exhaustless resources to support his unhallowed pursuits, he consigned other apartments of the palace to the most infamous purposes. A few of the upper galleries were appropriated to the lectures of the various professors; others were let to restaurateurs; but more were devoted to the accommodation of the gambler and the sensualist, and became the favourite haunt of every species of vice and debauchery.

The arcades of the ground-story are occupied by innumerable shops of small dimensions, but tastefully and elegantly fitted up. Every article of luxury, every thing which can contribute to the ornament of the person, to the gratification of the appetite, to the improvement of the intellect, or the contamination of the heart, is found here.

Let a man walk under these arcades at any hour of the day, and he will never want food either for meditation or amusement: but the Palais Royal exhibits a scene of peculiar interest in the evening. There is no want, either natural or artificial, no wish for the cultivation of the mind or decoration of the body, which would not here find food and gratification, and perpetual variety. All the necessities of life without exception, and all the inventions of refined luxury; every sensual and almost every mental gratification; the means of becoming in a few hours a Cæsar or a beggar; an exchange and a theatre; gaming-houses and banks for lending money; reading-rooms and brothels; blind virtuosi and sharp-sighted loungers; sumptuous tables for the gold of the wealthy; cynical repasts for the copper sous of the indigent: the productions of all the quarters of the globe, are here concentrated for the crowds that pass into and out of this place like the tides of the ocean. The concourse of people in the Palais Royal is never at an end; its public is the most numerous, as well as the most brilliant, of any of the places of resort in this city. The gardens of the Tuileries, the Luxembourg, the Boulevards, in short, none of the promenades, are to be brought into comparison with the Palais Royal.

Books are the only articles sold here at the same price as in other parts of Paris; but other dealers are supposed to charge double for what they sell, so that their rapacity has given this place the name of the Camp of the Tartars. The glazed gallery which is on the side towards the Rue de Richelieu, is called the Camp of the Barbarians. In this narrow passage, which is often nearly choked with a crowd, people should look narrowly to their pockets. Wretched coffee-houses line both sides of this place: here also are billiard-tables that never see day-light; while the darkness that pervades the shops of the dealers in furniture and wearing apparel, prevents the discovery of any of their defects.

The garden is enclosed on three sides with uniform buildings four stories in height. A narrow gallery runs round the bottom of the building to the extent of a

VOL. XVIII. No. 1257.

quarter of a league, which is sheltered from the weather, and preserves a view of the garden. In the day this gallery is lighted by the arches, but at night it is illuminated by 180 lamps. Each of the galleries here is let at an annual rent of 8000 francs, and the space on the ground at 3000 francs. The promenades under the arcades and in the passages are always filled with ladies and loungers of every description. It is impossible not to be delighted with the peculiar elegance with which the rival shop-keepers light up their little cabinets of *bijouterie*, and with the splendour produced by the general illumination.

Not being accustomed to view palaces laid out into compartments for trade, the imagination is forcibly struck to behold such a pile of building, to contemplate the lengthened arcades, and to perceive that they all abound with the efforts of human industry, in almost countless divisions. Retail traders never before were seen in so splendid a mansion. The sensations produced by the lights, the moving crowd, and the merchandize exposed as already described, are not a little heightened by music, vocal and instrumental, that strikes the ear with peculiar force; it being both loud, and often, as it were, on the very spot, though the stranger cannot divine whence it proceeds. Presently that which was loud before comes ten times louder, and his hearing leads his eye to the descent into a cellar, and, should he enter, he finds a strange mixture of the working people and the wealthier citizens; some clean, some dirty, sitting over their small beer, lemonade, bavaroise, or some other liquor, regaling themselves with feasting and music.

An imitation of these bazars was attempted in London a few years ago, (1815-16.) Mr. Trotter, happening to possess, in Soho-square, some very-extensive warehouses entirely unoccupied, fitted up a considerable portion of this building for the purposes of a bazar. The great sale-room is hung with red baize, adorned with mirrors, chandeliers, &c. &c. and laid out in alleys of handsome counters. These, as is expressed in the advertisement, are let by the foot and by the day, to persons of *unquestionable character* and moral respectability; and this, we are told, is the prominent feature of the English bazaar, so that it was intended to imitate only the very best and most reputable part of the French one. A most flaming and flattering article appeared, in aid of this institution in the New Monthly Magazine for February 1816. wherein Mr. Trotter is described as "the possessor of premises almost equal to the benevolence of his heart;" and the writer of which was "happy in taking this early opportunity of paying his tribute of cordial applause to a gentleman whom it will send down to posterity with the Howards, Jenners, Wilberforces, and other benefactors of mankind!" The experiment succeeded; and the imitation was imitated in almost every street in London, some shops being more like the French bazars, others less so. A bazar in the Strand had instrumental music by day, to which was added vocal, and a lottery, at night. The regular shop-keepers were alarmed; they found themselves deserted, while the showy stalls were crowded. They applied to the magistrates; they applied to the legislature: the magistrates could do nothing; the legislature would do nothing; but, in about a twelvemonth, these bazars all melted away of their own accord, leaving only Mr. Trotter's original show-shop in Soho-square, unless the Burlington arcade, since erected, may be thought to bear some resemblance to the arcades of the Palais Royal.

The *gaming-tables* are dispersed over the Palais Royal. After having ascended a stair-case, you are introduced into an anti-chamber, where several hundred hats, sticks, and great coats, carefully ticketed, are arranged under the charge of two or three old men, who receive either one or two sous from every owner. From the anti-chamber you enter into various large and well-lighted rooms, all equally well attended, and containing a vast crowd of persons, seated and engaged in gaming. The tables are licensed by government, pay to it a considerable sum of money,

money, and are under its immediate inspection : they are well regulated ; but still are dangerous places, as many English know. In divers subterraneous chambers are many scenes of unfashioned dissipation, where the game of billiards is dexterously played, and too well attended.

The *restaurateurs* in the Palais Royal are by far the most famous and most frequented ; their larders are the choicest, their bill of fare the longest, and their dining-rooms the most elegant, in all Paris. You have in them the choice of more than two hundred dishes, of above twenty sorts of desserts, upwards of twenty kinds of wine, and more than twenty species of liqueurs.

The *coffee-houses* form another point of meeting for the multitude, who do not go merely to take a walk, or who choose to recreate themselves after walking. Coffee, lemonade, orgeat, liqueurs, and ice, are to be had in all of them, and of equal qualities ; they are most lively and gay, in the morning from nine to eleven ; in the afternoon from three to six ; and in the evening from eight to eleven.

Adopting our opinions from antient mythology, we might say that all the inhabitants of Olympus, the gods of Wisdom excepted, had contributed to the creation of this place. Comus, Mercury, Plutus, and Cytherea, however, constantly hold their court here. The long galleries here, with their elegant shops, exhibit every thing the most seducing that opulence or luxury can desire, not excepting trinkets, jewels, and various articles equally curious and rare. Happy are they who are content with the worship paid here to Festivity, and avoid the neighbouring saloon dedicated to Plutus, or that higher still to sacrifice to the popular Venus of the day ; for the Palais Royal is the favourite haunt and chosen residence of this miserable and degraded class of society. The regulations of the police, with respect to these unhappy beings are peculiar. Every prostitute is compelled to take out a license at the proper bureau, for which she pays a stipulated sum. Her name, age, and abode, are entered ; once in every month she is visited by a medical man, appointed for the purpose, who gives her, or withholds according to circumstances, a *carte de santé*, or bill of health. Should she dare to pursue her calling without this license and this medical insurance, she is liable to fine, imprisonment, and corporal punishment.

Our description would be incomplete were we not to point out the places where, for a few sous, the votaries may be supplied with tobacco and beer, and the performances of some ventriloquist ; or those restaurateurs where you may at once regale upon insipid soup and discordant music. Here are tailors' shops, where you may be suited in a minute ; reading-rooms, and a long train of etceteras all calculated as much for the benefit of the body as the mind. In fine, the Palais Royal is said to embrace every profession but that of an apothecary and a physician ; and, being the only place where people can walk under cover from the rain, its attractions are equal either in summer or winter. Its proximity to the Exchange increases its bustle ; but the vigilance of the police prevents any disorders, whilst a wise regulation prohibits the priestesses of Venus from spreading their nets before the dusk of the evening.

The *Exchange* is held, provisionally, in the great court of the Palais Royal, while a new building is erecting in Rue des Filles St. Thomas. If we may judge from its present appearance, it will be one of the largest and most beautiful edifices of the kind in Europe. It will be a long square, of a noble yet simple architecture. Its only ornament will consist of a series of medallions, representing the different coins of Europe. A peristyle of the Ionic order will surround it, and serve as a promenade in winter. Six millions of livres have been voted for the completion of this building.

Near the Palais Royal is the *Place des Victoires*.—The marshal de la Feuillade, loaded with benefits by Louis XIV. wished to leave to posterity some public testimony

of his gratitude. For this purpose he built this "Place," of a semicircular form ; and in the centre he placed a colossal statue of Louis XIV. with Victory standing on a globe behind him, and placing a crown on his head. Hence the name. This statue was destroyed in 1792, and a colossal figure of general Desaix erected in its stead, which in its turn has likewise disappeared. The houses are noble and uniform, and adorned with Ionic pilasters. The Place des Victoires is, however, too narrow ; and the avenues to it are sometimes dangerous from the number of carriages.

THE LUXEMBOURG ; now called *Palais de la Chambre des Pairs*, or House of Lords ; Rue Vaugirard.—Of all the royal palaces in the metropolis, and even in France, none surpasses the Luxembourg in magnificence. It was built for Mary de Medicis, widow of Henry IV. in 1612, by Jacques Desbrosses, upon the model of the Palais Pitti at Florence, where this queen had resided in her youth. Few palaces have so frequently changed their possessors. During the revolution it was a prison ; and is now occupied by the senate. This edifice, distinguished by the boldness of its architecture, its regularity and beautiful proportion, nearly forms an exact square. Though the architecture of Florence is visible upon each of its fronts, that towards the garden is universally admired. The statues here are by Cartelier, and those towards the court by Desparcieux. The great staircase in the right wing of the court, ornamented with the statues of several French generals and legislators, is very fine. To the right of this an arcade is now opened, the centre of which corresponds with another opposite, and a fountain decorated with a pedestal bearing a marble statue. A free communication being established under the galleries, persons may walk all round in rainy weather and in winter among the orange-trees. In the apartments leading to the Hall of the Sitings there is a fine figure by Puget, representing Hercules at rest ; and in another a ceiling by Barthelemy : in the Hall of the Sitings are several statues in plaster of Grecian and Roman orators ; and in one of the apartments in an angle of the pavilion, there are some cloth hangings, and some furniture covered with velvet, upon which some of the finest monuments in Rome and its environs are represented. Some of these rooms communicate with the gallery of pictures, which contained the best pieces of Le Sueur, Vernet, and several other masters, now in the Louvre. The ceiling of the Rubens Gallery is decorated with a painting by Calais, representing the twelve months of the year, arranged in the order used before the re-establishment of the Gregorian calendar in 1806. The new iron railing on each side the palace, 80 feet long, which confines the private buildings, and the plantations, which are calculated for general ornament, do honour to the talents of M. Baraguey.

The garden of the Luxembourg begins to lose its former sombre appearance, which towards the south used to be enclosed with high walls ; but at present the view extends beyond the large close of the Chartreux, now transformed into a magnificent *pepiniere royale*, or nursery-garden, which, being only separated by a wall breast-high, appears to increase the extent of the garden. To the right of the palace is a plantation of young maples, the fresh verdure of which and their moderate height form an agreeable contrast with the ancient grove on the other side, whose shades administer to the most profound meditation. In the midst of the whole is the *parterre*, no longer disfigured by the mournful yews shaped into a thousand grotesque forms, and consisting of alleys, walls, and ruins. A fine sloping lawn is now to be seen on the right and left of this spot ; its walks, planted with trees, of a middle growth, afford an agreeable mixture of flowers and foliage.

The noble monastery of the Chartreux, with its vast dependencies, once occupied the right side of the garden. The manner in which this territory came into the possession of the monks is singular and ridiculous. The chateau

chateau of Vauvert, built by Robert II. the son of Hugh Capet, having been abandoned, a report was propagated, that innumerable demons had made it their abode. The most frightful forms were seen, and the most terrific noises were heard every night. No one dared to approach the fatal walls after sunset, and the inhabitants of the neighbouring houses fled in terror from their dwellings. The monks of the Carthusian monastery of Gentilly, whose desire of aggrandisement overcame their fears of the mysterious inhabitants of the chateau, or who possibly were already qualified to give a good account of these nocturnal revels, petitioned St. Louis to grant them the deserted edifice and its domains, pledging themselves to exorcise the fiends, and to deliver the neighbourhood from the disturbers of its repose. They took possession of the chateau with much imposing solemnity; and the demons were required to quit for ever the domains which were now consecrated to the service of God. They heard, trembled, and obeyed. Neither the vigils of the ghostly fathers, nor the slumbers of the superstitious peasants, were again disturbed. The monastery remained about 600 years, but it appeared at its dissolution that the exorcism of the friars had been effectual.

The Library of the Arsenal now forms part of the library of the Luxembourg. This magnificent collection was purchased by the count d'Artois, from the celebrated Paulmy d'Argenson. It contains 75,000 printed volumes, and 6000 MSS. Many of the missals are beautifully illuminated on vellum. One is called the Breviary of René king of Naples and Sicily, with a title in Moorish Arabic; another is in letters of gold, of the ninth century, containing the four evangelists. In this library, also, are a globe constructed for the purpose of teaching the last Dauphin geography; and steps made for Marie Antoinette, that move by a spring, and may be directed to any part of the room at pleasure, by the person sitting on them.

This library contains also a magnificent collection of works on the military art: but it is not confined to them; it is rich in general history, foreign literature, and Italian poetry.

When the Prussians arrived in Paris, on their second expedition, they appeared to be disposed to despoil this library of its most valuable works. M. Treneuil, the librarian, and even the French minister of the interior, interfered in vain; but the energetic remonstrances of the celebrated Humboldt preserved it from destruction.

Near the Luxembourg is the *Church of St. Sulpice*.—The majestic portico was the work of Servandoni. Its grand proportions, the boldness of the design, and the sublime effect which it produces, are universally acknowledged. It is composed of two orders, the Doric and the Ionic, placed above each other. The Doric columns are forty feet high, and five feet in diameter, with an entablature of ten feet. The Ionic pillars are thirty-eight feet in height, and four feet eight inches in diameter, with an entablature of nine feet. A tower rises on each side of the portico to the height of 210 feet. They were originally of a different style of architecture, and were not supposed to accord well with the other parts of the building: they are indebted to M. Chalgrin for their present appearance.

The interior of the building, in which the Corinthian order reigns, is not less interesting than the exterior. The composition of the principal altar between the nave and the choir is grand and sublime. Its form is that of an ancient tomb of beautiful marble. The spacious choir is decorated with the colossal statues of our Saviour, St. Peter, St. Paul, and St. John the Evangelist, by Bouchardon. It is terminated by a magnificent chapel, dedicated to the Virgin. Above the altar of white marble rise some columns of blue marble, of the composite order, with gilt chapiters, supporting an entablature crowned by numerous figures in bronze. The cupola, imitatively representing the Assumption, is by Lemoine: and the ingenious

manner in which the light is admitted produces a magical effect. The vessels containing the holy water are curiously formed of two immense skulls, which the republic of Venice presented to Francis I. They are placed on a rock executed by Pigal. This interesting edifice was sadly despoiled during the revolution.

The subterranean church is remarkable for its extent; and gives a tolerable idea of the ancient catacombs.

In front of the church is one of those fountains with which Paris so much abounds. It is a pleasing little structure, but lost in the immensity of the area in which it is situated. It is a massive square, with an entablature on each side, ornamented by bas-reliefs in marble, representing Peace, Agriculture, Commerce, and the Arts. On two of the sides are sculptures in white marble, in the form of the upper part of a vase, whence the water falls into semicircular cisterns of marble, and thence into a circular basin.

There is another fountain in the same street, the Rue de Vaugirard. This fountain is composed of two pilasters, surmounted by a pediment. A bas-relief represents Leda on the banks of the Eurotas, and Jupiter under the form of a swan. The artist, who had only a small stream of water at his disposal, has very tastefully made it issue from the beak of an elegant bird.

HOTEL BOURBON; now called the Palace of the Representatives, Chamber of Deputies, or House of Commons; Rue de l'Université.—This palace was built by the dukes of Bourbon, in 1722, after the designs of Girardini, an Italian architect. It was afterwards considerably improved and enlarged by the prince of Condé. It is delightfully situated on the banks of the Seine, at the foot of the Pont Louis XVI. and opposite to the Place Louis XV. and commands a pleasing view of the Tuileries and the Elysian Fields. It was intended to be a country-house more than a palace, and the character of the edifice on the river-side accords with this destination. Its principal entrance towards the street combines simplicity and grandeur. It consists of one noble portico, with a colonnade of the Corinthian order on each side. The front towards the bridge consists of twelve Corinthian columns, surmounted by a well-proportioned pediment. It would have been considerably improved, had its pillars been fluted and more massive, and had the stone of which it is constructed been of a softer white. The statues of Sully, Colbert, l'Hôpital, and d'Agneſſeau, decorate the sides of the pediment, and at the bottom of the steps are Minerva and the Genius of France.

When Louis XVI. erected the bridge that bears his name, immediately before one of the pavilions of this palace, the necessity of raising the neighbouring ground destroyed much of the beauty of this edifice; and, causing it to appear as if it were sunk in a valley, gave to the too-diminutive proportions of the building an air of insignificance. The prince to whom the palace belonged perceived and lamented this, and determined to enlarge and almost rebuild the edifice. But the Revolution ordered it otherwise. The Palace of Bourbon was among the first that was ravaged and mutilated, and it remained unoccupied and unappropriated until the Council of Five Hundred was established in it.

On the opposite sides of the square are two halls, dedicated to Peace and Victory. These communicate on one side with the apartments of the palace, and on the other with two stone staircases of exquisite workmanship, leading to the upper part of the Hall of the Representatives. This hall was built in the third year of the Revolution, on the site of some of the apartments of the old palace. At the foot of the bridge of Louis XVI. is an avenue for the use of the members; and nearly facing the Rue de Lille is the way to the public tribune. The hall is a very handsome room, in the form of a half oval. It is ornamented with six statues, representing Lycurgus, Solon, Demosthenes, Brutus, Cato, and Cicero. Near the president's chair are two figures in bas-relief, of History and Fame.

Fame. Immediately below the president are desks for the secretaries; and one or two benches, covered with blue leather, are appropriated to such of the king's ministers as may have occasion to attend the assembly. The desk and seat of the president are formed out of solid mahogany, decorated with gilt bronze. The centre has a marble pavement floor, in compartments ornamented with allegorical attributes and emblems. The two great doors which open into the hall are of solid mahogany, with stars of gold; their surrounding frames are in fine white marble, with rich sculpture.

The members do not rise and speak from their places, but the person who wishes to address the assembly is obliged to cross the floor, and ascend a kind of rostrum or tribune; a ceremony which must tend much to damp the speaker's fire.

Adjoining the hall is the robing-chamber, constructed in what was formerly called the Pavillon Valois. It communicates with the hall by a gallery. On the right of the president is a chamber used for conferences; to the left is the Saloon of Liberty, formerly appropriated to those who had petitions to present.

The library of the Palais Royal is now appropriated to the use of the members of the tribunate, and the chief officers of state. It was formed in the eighth year of the Revolution, with books collected from the literary depôts at Paris. It has been since augmented by the contributions of many living authors. This collection was placed in the Tuileries, but afterwards removed to the Palace of Bourbon.

The terrace of this palace, more than 300 feet in length, overlooks the Quai d'Orfai; and the view from it is one of the most beautiful and varied that Paris affords. A considerable part of the city, a long reach of the Seine, the garden and palace of the Tuileries, the bridge and square of Louis XV, the Elysian Fields, the road to Versailles, and the villages of Chaillot, Passy, and Auteuil, are distinctly seen.

PALAIS DE JUSTICE, the Palace or Hall of Justice.—The term *palace* is still applied to this building because it was formerly the residence of the kings of France; but its origin is lost in the obscurity of time. It is supposed to have been built by Eudes, in the ninth century; and it was the usual residence of the kings till the reign of Charles V, who left it for the Hotel St. Paul. About the year 1000, king Robert began to build its first galleries and towers; and its garden then extended as far as La Cour Lamoignon. St. Louis built the bedchamber which still bears his name, as well as the grand chamber and the Holy Chapel. Philip le Bel made considerable augmentations in 1313; and it again became the usual abode of the French monarchs. It merely consisted, however, of several enormous towers, which communicated with each other by means of long galleries. The grand hall is frequently spoken of by the French historians. The kings there received the ambassadors of foreign nations, and it was the scene of their most splendid entertainments. It was adorned by the statues of the successive monarchs from the time of Pharamond. At the upper end was a marble table of enormous and almost incredible dimensions. The princes of the blood were alone admitted to the honours of this table. In 1618, the palace was destroyed by fire, and the statues of the kings and the magnificent marble table disappeared for ever.

Desbrosses, the architect of the Luxembourg, was employed to rebuild the edifice. An iron palisade, 120 feet in length, encloses an immense court, surrounded on three sides by buildings. The centre gate of the palisade is a curious proof how easily beauty and effect may be destroyed by multiplicity of ornament. At the bottom of the court is a grand flight of steps, which gives an air of magnificence to a building otherwise not remarkable. At the summit of the steps are four noble Doric pillars, surmounted by a balustrade; and on the entablature are four gigantic upright statues, representing Justice, For-

titude, Plenty, and Prudence. A quadrangular dome crowns this mass of buildings. At the bottom of the steps, on each side, are two arcades, one of which leads to the Conciergerie. The rest of the palace is constructed of arcades, supporting two floors of the Doric order, surmounted by an attic.

The *Sainte Chapelle*, or Holy Chapel, is one of the most beautiful Gothic edifices in Europe. It is now filled with the archives of the kingdom. An exquisite painting by Germain-Pilen, some superb painted glass, and a few magnificent relics, are shown here.

A staircase on the right conduits to the grand hall. It is composed of two immense parallel naves, arched with stone, and separated by a range of arcades. The light is received from enormous windows at the extremities. Although the centre is thus rendered somewhat obscure, yet this disposition of the light gives to the hall an air of religious and awful grandeur. The Doric order prevails in the decorations of the hall; and the architecture does honour to the period in which it was executed.

This hall is now devoted to the sittings of the Court of Cassation; and the other parts of the palace are appropriated to the other tribunals.

Since the restoration of the Bourbons, the French government has evinced an anxiety to administer justice in a similar manner to that practised in England, particularly as it respects trial by jury: but the difficulty of forming proper juries is such, that a sense of shame alone prevents the institution being given up in despair: it certainly is not popular. (Edinb. Rev. No lxxvii.)

Cour de Cassation, or Court of Appeal.—This court does not judge respecting the rights of the parties, but only reverses or confirms the decrees of other courts, either on account of informality in the proceedings or misapplication of the laws, and refers the proceedings to the same or any other court at its discretion. This court is composed of a president, three sub-presidents, forty-five counsellors, a procurer-general, four general advocates, and a recorder. It has no vacations, and is divided into three sections.

The Court of Requests determines upon or rejects the applications made; and the hearings are on Tuesdays, Wednesdays, and Thursdays. Here is likewise a civil and a criminal department. A college of fifty advocates enjoy the exclusive right of pleading before the court.

Cour des Comptes.—Court of Audit. It receives the affidavits, and audits the accounts, of the receivers general, paymasters, &c. It is composed of three chambers. The sittings are held five days in the week, and commence at nine in the morning. Here are no vacations.

Cour Royale, or Royal Court.—This court consists of five chambers; three for civil actions, one for appeals from the correctional police, and another for accusations. The first chamber gives audiences on Mondays and Tuesdays at nine in the morning, and on Fridays and Saturdays at noon. The grand audiences of the first and second chambers united, are held on Monday at noon; and those of the first and third, on Saturday at noon. They open the day after the first Sunday in December, and close on the 15th of August. This court has a vacation from the first of September to the first of November; but the criminal chambers, and the courts of assize, have no vacations. A numerous college of advocates, celebrated for their talents and understanding, enjoy the right of pleading before the court; and seventy-four solicitors are also exclusively admitted into the Cour Royale.

Tribunal de Premiere Instance, or Initiatory Court.—This is composed of thirty-six judges, a president, five vice-presidents, &c. and is divided into six chambers, five of which take cognizance of civil and the sixth of correctional affairs. Audience is given every day not a holiday, Mondays excepted. An hundred and fifty solicitors have an exclusive privilege of being employed in this court.

There are 114 notaries in Paris, who write all agreements, wills, life-certificates, leases, mortgages, sales of estates,

estates, and other authentic acts. Attorneys in Paris do not, as in London, transact any business of this kind. The difference between conveyancing-attorney and attorney at common law, is only voluntary in England; but it is not so in France, where the *avocat*, or attorney at law, never makes conveyances, and the notary cannot act in a court of law.

Tribunal de Police Municipal, or Head Police-office.—The justices of the peace sit here alternately, and judge all police-affairs from one franc to twenty-five francs. They are twelve in number, being one for each arrondissement, who settle all trifling differences between individuals. They hold their sittings at different places, in the manner of our police-magistrates, being all under the guidance of the minister of the interior, formerly called lieutenant of the police.

The royal police-guard, *commissaires de police* as they are called, are similar to our police-constables. They attend at all public places to preserve order, and to arrest suspicious persons; they are in number 1217. There is also a battalion of 572 fappers and firemen, to attend at any conflagrations that may happen in the city.

The police of France, and of Paris in particular, has always been proverbially strict. Every one has heard or read how it was administered during the reigns of Louis XV. and XVI. that it did not relax under Napoleon, we have given a proof in the article LONDON, vol. xiii. p. 598. and, by a reference to p. 448 of the present article, it will be seen how low the system of espionage is carried at this time. Indeed it appears to us, that there is a continual struggle of the government (of the *ultras* at least, though contrary to the wish of the king) to get rid of the charter, or so to weaken it as to revert by degrees to the ancient despotism. The following is part of the speech of M. Girardin in the chamber of deputies on the 9th of last month, (Jan. 1821.) "We see *privilege* introduced into our elections, practically to destroy the first political right of the French people; *lettres de cachet* revived under another form to overthrow the fourth article of the charter; and the censorship undertake to annihilate the eighth article. A varnish of legality renders this still more hateful and more formidable. Anarchy may fairly be said to exist, where individual liberty has lost its securities; where that of writing can be exercised no longer; where the citizens are dragged from before their natural judges; where the prisons are crowded—yes, where the prisons are crammed full, and where secret captivity has replaced the torture. I myself have seen, gentlemen, these wretched captives; some of them, have I beheld so near falling victims to this cruelty, that in two days, it is probable, they will have perished." Resuming the thread of the former passage, he repeated; "Where secret confinement has replaced the torture; where juries are nothing better than commissions from the crown; party-spirit is substituted for that of justice; where the police provokes disorders instead of repressing them, and hires numberless agents to organize conspiracies and to manufacture traitors; where government oppresses the consciences of such of the electors as have public duties to discharge; where informers are encouraged; where certain favourite newspapers, at their own will and pleasure, libel the most illustrious citizens; &c. &c." In some parts of this speech, we seem to be reading the state of our own country, instead of that of France.

La Conciergerie.—This prison is situated under the Palais de Justice, and is appropriated for the reception of those who, convicted of crimes, await the sentence of the law. The entrance to this fabric is in the court of the palace, being rendered conspicuous by an ornamented arcade. Within the walls of this fatal building were confined, in 1794, the amiable and ingenious Lavoisier; also Malesherbes, Condorcet, and numerous other characters as renowned for their virtues as for their learning.

Other prisons, which, as connected with the courts of justice, may as well be noticed here, are—

VOL. XVIII. No. 1257.

Le Temple, Rue de la Corderie.—The tower of the Temple was used as a place of confinement for prisoners of state. It was particularly interesting to the traveller as having been the last residence of the unfortunate Louis XVI. and his family, who only quitted its gloomy precincts to ascend the scaffold. The gallant sir Sidney Smith was confined here; and within these walls the unfortunate captain Wright lost his life. The pile of buildings which originally occupied the enclosure of the Temple has been partly demolished; and streets have been erected on the site communicating with the Corderie.

The Temple was built in 1200, and was the principal residence of the Knights Templars. Their increasing numbers, wealth, and power, rendered them an object of jealousy to the sovereigns in whose dominions they resided; and the pope and the king of France conspired together to dissolve the order, and to seize on all their riches. They were accused of the most horrible crimes, were condemned almost unheard, and 54 of them were burnt with a slow fire on the Pont Neuf.

La Force, or *Grande Force*, near the Place Royal.—This is a vast and strong prison. The massive vaulting of the great entrance presents a very fine specimen of modern architecture, and is the only one of this kind in Paris. This edifice is divided into six departments, each having a court-yard, covered gallery, infirmary, a store for common use, and reflectors which are kept burning all night.

La Petite Force, Rue Pavée aux Marais—is a prison for prostitutes.

St. Pelagie, Rue de la Clef.—This building, erected in 1665 for the reception of female penitents, was converted into a prison at the commencement of the revolution. It is large, commodious, well distributed, and well ventilated. It is now a place of confinement for debtors, and for those who are detained by the police.

Les Madelonnettes, Rue des Fontaines.—It was formerly a monastery, but is now transformed into a prison for women convicted of crimes.

The *Bicetre*—is situated on the road to Fontainebleau, about a league and a half from Paris. In the centre of an hospital for the blind and insane is a strong prison in which those who are condemned to the galleys are confined until the time of their departure. They who are adjudged to suffer a certain period of imprisonment are likewise often sent here; and many who are suspected of crimes against the state are lodged within these walls.

St. Lazare, Rue St. Denis.—Women sentenced to different periods of imprisonment are confined here, under an excellent system of management, and being compelled to work, are frequently taught habits of industry. The beautiful needle-work of the inhabitants of St. Lazare, is universally admired.

The *Abbaye*, Rue St. Marguerite.—This was the theatre of the most dreadful massacres in September 1792. It is now a military prison; as is also the *Montaigne*, in the Rue des Sept Voies.

The internal management of all these places has been much improved within the last ten years. The prisoners are employed in work for themselves; they are well treated and have plenty of food. No one is allowed to see them without permission from the prefecture of police. Regard is had to the proper classification of prisoners, according to their age and sex; just complaints are listened to, and abuses are promptly redressed.

The *Pont au Change*—is close to the Palace of Justice; and was formerly designated *Grand Pont* and *Pont Oiseaux*, the Great Bridge, and the Bridge of Birds. It is of great antiquity, and assumed its present name when Louis the Young first established the Exchange. It has been often swept away by inundations and by ice. It was destroyed by fire in 1621 and 1639, reconstructed in stone in 1647, and repaired in 1788, at which period it was divested of the houses which had hitherto encumbered it.

The *Place du Chatelet* is at the foot of the Pont au Change.—Its form is quadrilateral; and in the centre is
6 B a column

a column in the Egyptian style, about 56 feet high, crowned with a gilt statue of Victory, by Brizot; and at the foot are four figures of Vigilance, Law, Fortitude, and Prudence, by the same artist. Every week, goods taken in execution are sold in this square.

The *Pont St. Michel*—also stands near the Palace of Justice. It was built of stone under Charles VI. and rebuilt in 1618; when it was made sixty feet longer, and twenty wider. Its architecture is bold and solid.

PALAIS DES BEAUX ARTS, Palace of the Fine Arts; Quai Conti.—This edifice, erected by the cardinal Mazarine, was long known by the name of "The College of the Four Nations," because it was designed by its noble founder to receive sixty pupils of the four nations conquered by Louis XIV. The ashes of the cardinal repose in the church near the sanctuary.

It is now appropriated to the use of the Institute, which has resumed its former name, the Royal Academy. It is of a semicircular form, composed of two pavilions, two ranges of buildings flanking them, and a portico of the Corinthian order in the centre surmounted by a dome much admired. Some exquisite groups, by Desjardins, ornament the portico. In the first court on the left is the Mazarine Library, containing 60,000 volumes, and that of the Academy. In the next court is the School of the Fine Arts, and the Architectural Gallery of that school. The ancient chapel is now appropriated to the fittings of the Academy. It is decorated with the busts of the most celebrated French literati.

"It is impossible," says an American traveller, "for a foreigner and a student to be a week in the French capital without having his imagination absolutely overpowered, and his enthusiasm wound up to the highest pitch, by the *celat* which he sees attendant on science and literature, and the facilities which he finds open to him for the culture of all the branches of human knowledge. For, besides the libraries, and other establishments already mentioned, all of which are accessible upon the easiest terms, there are innumerable gratuitous lectures read, at the expense of the government, at all hours of the day: a garden of plants, and a museum of natural history, the most perfect in the arrangement, and the most ample in the materials, to be found in the world; and the branches of knowledge to which they relate are daily explained to all visitors by men illustrious for their skill and their discoveries; public exhibitions to excite literary emulation, and national rewards to give spirit to literary industry."

The history of the Royal Academy, up to the time of the revolution, has been given briefly under the article **ACADEMY**, vol. i. p. 45. and its change to National Institute, and afterwards to Imperial Institute, has been noticed there, but more fully under the article **INSTITUTE**, vol. xi. p. 145, 6. The account there given may serve nearly for the "Royal Academy" in its present state. The alterations have been more in names than in substance. However, we may just mention, that, on the 25th of March, 1816, an ordonnance of Louis XVIII. was published, for converting the Institute into its old form of four Academies; namely, the French Academy, the Royal Academy of Inscriptions and Belles Lettres, the Royal Academy of Sciences, and the Royal Academy of Fine Arts. The first meeting of the French Academy (thus restored) took place accordingly on the 29th of March: the duke of Richelieu was chosen president; and M. de Fontanes, vice-president.

The *Pont des Arts*—is a fine bridge which joins the Palace of Arts to the Louvre. It was built by Demoutier in 1804. It has nine arches, of cast iron, each supported by three girders; and it is perfectly horizontal. It is open only to foot-passengers, who pay one sou each. It was formerly ornamented with flowers, and was the fashionable promenade of the Parisians; but it is now almost deserted.

The *Royal Library*, Rue Richelieu.—The exterior of this edifice is exceedingly plain, and gives no indication

of the treasures that it contains. Neither the windows nor the principal entrance have the least ornament. An archway admits to a court, which is no less than 544 English feet in length, and its breadth 128. In this court is a fine statue in bronze, representing a woman resting on one foot, in a very easy and natural attitude. The principal floor of the building which surrounds this large court is entirely filled up with books, from the bottom to the ceiling.

The Royal Library dates its origin from a very early period. King John collected ten volumes; six on science and history, and four on religion. To them, his son Charles V. surnamed the Wise, added more than nine hundred volumes. These constituted a library which, at that age, might justly be deemed worthy of the royal collector. It was deposited in a tower of the Louvre, called *la Tour de la Librairie*, the Library Tower. The apartment was illuminated at night by thirty small chandeliers and a silver lamp, that the student might pursue his researches at every hour. It appears to have been afterwards neglected, and almost destroyed; for, when it was purchased by the duke of Bedford, for 1200 livres, in 1429, it was found to contain but 150 volumes. Louis XI. collected the scattered remains of this library, and profited by the resources which the invention of printing presented to him. Charles VIII. added to it what the conquest of Naples enabled him to collect. Louis XII. enriched it with the library of Petrarch; Francis I. with some Greek MSS. and Henry II. greatly augmented it in consequence of a decree, in 1556, enjoining all booksellers to furnish it with a copy, on vellum, of every work which they published. Colbert augmented it with more than 60,000 volumes. Cardinal Fleury sent many literati, at an enormous expense, to the Greek islands and Asiatic continent, who brought home numerous curious and invaluable morsels of antiquity. It was, however, under the reigns of Louis XIV. XV. and XVI. that it attained that degree of splendour and magnificence which renders it the first library in Europe.

The ground-floor is appropriated to the printed books, of which there are 360,000. Tables are placed in different parts of the room for the accommodation of visitors, who may call for whatever books they please, and before whom the scarcest prints, the rarest medals, the most valuable manuscripts, are unhesitatingly placed at the first requisition. Busts of the most celebrated French literati occupy several niches. In one of the rooms is a curious model of the Pyramids and the Sphinx, accurately preserving their proportions, and ornamented by a well-executed grove of palms, with a caravan of travellers.

On the second floor, to the right, is the French Parnassus, by Titon du Tillet. It represents a little mountain, covered with bronze figures of the most celebrated poets and musicians of France. Louis XIV. appears under the figure of Apollo. This floor contains the MSS. of which there are 80,000. Thirty thousand of these relate to the history of France, principally subsequent to the reign of Louis XI. Twenty-five thousand are in learned and foreign languages. Several letters of Henry VIII. are here preserved, and letters from Henry IV. of France to one of his favourites, Gabrielle d'Estrees. The manuscripts found by Denon in the mummies of the catacombs at Thebes will not be forgotten by the traveller; nor the celebrated tablet of Isis, incrustured with silver, and filled with undeciphered Egyptian hieroglyphics; the MS. of Telemachus, in the hand-writing of Fenelon; and Memoirs of Louis XIV. by the same excellent author.

The libraries of Vatican at Rome, and St. Marc at Venice, lately enriched this collection with many invaluable MSS. but these, with all the revolutionary spoils, have been restored. The inestimable MS. of the History of Josephus, on papyrus; Petrarch's MS. of Virgil, with numerous notes in his own writing; the MS. of Galileo on the tides; the mathematical tables of Haller, with corrections by himself; all the ancient and rare editions of

the Vatican, the Ambrosian library, and that of the university of Pavia; are now lost to the visiter.

Among other curiosities contained in this apartment; is an ibis, brought from Thebes, the plumage of which is fresh and perfect, although three thousand years have passed since it was first enclosed in its case. The silver shield, attributed to Scipio and Hannibal, are seen here, with the brazen chair of king Dagobert, and the heart of Anne of Britanny enclosed in a golden vase.

On this floor are likewise five great rooms, containing the genealogies of every noble French family. These fill 5000 portfolios.

On the same floor is the Cabinet of Medals, which well deserves the attention of the curious. The voyages of Dumonceau and le Vaillant were principally undertaken to complete this superb cabinet. Le Vaillant, zealous to execute his commission, swallowed twenty medals of gold, to preserve them from the Algerines, into whose power he had fallen. Three admirable paintings, by Notaire, adorn this apartment, representing Thalia, Calliope, and Terpsichore. There are also three beautiful productions of Carlo Vanloo.

On the third floor is the Cabinet of Antiquities, containing busts, vases, inscriptions, and instruments of sacrifice, collected by the celebrated Caylus. Near this are two apartments, containing Etruscan vases, bathing-vessels of porphyry, and many fine specimens of ancient art.

The Repository of Engravings comprises 5000 volumes, divided into twelve classes. The first contains sculpture, architecture, and the portraits of engravers; the second, emblematical and devotional subjects; the third, Greek and Roman antiquities, with fabulous and mythological subjects; the fourth, medals, coins, and heraldry; the fifth, public processions, banquets, and tournaments; the sixth, natural philosophy and the mathematics; the seventh, romantic and ludicrous subjects; the eighth, natural history; the ninth, geography; the tenth, plans and elevations of ancient and modern buildings; the eleventh, portraits to the number of 50,000, among which is included every celebrated character who has flourished in any country during the last six hundred years; the twelfth, represents the costume, manners, and amusements, of every region of the habitable globe. It comprises a very extensive and complete history of the costume and manners of the French from the era of Christ to the present period. Most of these engravings are coloured, and are copies from ancient windows, tapestry, and monuments. In another part of the building are two large globes, thirty feet in diameter. They were constructed by Coronelli, in 1682, are accurately delineated, and supposed to be the largest extant. The index of the horary circle is a yard in length.

Attached to the library is the royal and special School of the Oriental living Languages, where professors give lectures, during the winter, in Sanscrit, Persian, Arabic, Turkish, and modern Greek. This excellent establishment was founded by the Chevalier Langlés, in the year 1795; he is the administrator of the school, and professor of Persian.

Besides this library, and some others we have incidentally noticed, extensive and valuable collections of books are attached to almost every public institution and every public building in Paris. Access to them is easily obtained by the inhabitants of Paris, and every facility is afforded to foreigners.

Museum of Natural History, and Botanical Garden; Rue St. Victoire.—This garden was founded by Jean de la Brosse, physician to Louis XIII. but it is indebted for its present beauty and value to the assiduous labours of Buffon. The name *Jardin Royal des Plantes* ill expresses the real nature and interest of the place. In addition to a noble botanic garden, it contains a large menagerie, a museum of natural history and anatomy, and numerous halls in which public lectures are delivered on every

branch of natural history and philosophy. Each of these divisions will afford inexhaustible amusement and information.

At the entrance of the botanic-garden, several square enclosures are observed, more interesting probably to the agriculturist than to the casual visiter. The first contains a curious collection of every different soil and manure, exhibiting in an instructive manner their comparative fertility and value. The second enclosure is occupied by specimens of every kind of fence, hedge, ditch, and ha-ha. It likewise exhibits the different methods of training espalier-fruits, ever-greens, &c. of every description. Beyond these are specimens of all the culinary vegetables, and of every plant that has been appropriated to the food of man, with the most approved and successful mode of training each. In the next enclosure are specimens, systematically arranged, of all the fruit-trees, with their numerous varieties, of which France or the neighbouring kingdoms can boast.

The visiter then arrives at the Botanic Garden. It consists of more than seven thousand plants, arranged according to the system of Jussieu. Every specimen is labelled; the beds are divided by little edges of box; and a pleasing admixture of shrubs and small plants removes the appearance of formality which usually accompanies botanic gardens. A piece of water, supplied from the Seine, is appropriated to the aquatic plants.

The green and hot houses will next attract attention. They are more than six hundred feet in length; and although their exterior presents nothing elegant, with the exception perhaps of the principal green-house, whose front is prettily ornamented with marble vases, the beautiful collection of flowers and shrubs within cannot fail to please not only the botanist, but the unlearned visiter. Every plant is here likewise labelled; the labels are placed in the most conspicuous situation, and changed as soon as they cease to be perfectly legible. The botanical student will here find some rare and unique specimens, the sugar-cane, and the bread-tree. He will particularly notice the date-palm, and two other rare species near the gate.

Proceeding onwards, a path winds up an artificial ascent, on the summit of which is a temple supported by eight pilasters, and surmounted by an armillary sphere. The greater part of Paris is here presented to the view. A person is usually in attendance, who will explain to the stranger the different edifices which he sees around him. The garden is concealed by the surrounding foliage. Half-way down the hill is the cedar of Lebanon, planted more than eighty years ago by Jussieu. Although its head was lopped off in one of the strangely-barbarous periods of the revolution, it is yet a noble object. Near it is a marble pedestal that once supported the bust of Linnæus; but this, too, perished amidst the wreck of science and virtue. Another bust of Linnæus, however, has been placed on a cippus at the end of the Botanical Garden, under the shade of some fine oaks.

The Botanical Garden is 330 toises or fathoms long, and 110 in breadth, partitioned lengthways, from its entrance down towards the Seine, by three very fine alleys, and intersected by various others, which terminate in the public *promenades*, or walks. On the second occupation of Paris by the allies, the Prussians solicited that they might bivouack in this garden. Had they accomplished their purpose, every interesting object would have been trodden under foot. The spirited remonstrances of the celebrated traveller Humboldt preserved the place from total destruction.

The tourist may here pause, and prepare himself for an investigation of the remaining treasures of the garden; for at the foot of this hill are several little *cafés*, at which he may be supplied with fruit, eggs, milk, coffee, and tea.

The Menagerie will probably be next visited. The traveller returns to the enclosures near the entrance, and, following a path on the right hand, arrives at the dens

dens in which are confined the fiercer beasts of prey. Several lions, tigers, panthers, hyenas, and wolves, amuse or terrify the spectators by their howlings. Where it could be accomplished, the trees and shrubs of the animals' native climes, or the vegetables in which they most delight, flourish within their enclosures. Several bears inhabit some sunken enclosures, and, having been accustomed to confinement from their birth, appear to be reconciled to their fate, and often amuse the spectators by many clumsy feats of agility. Two camels are perfectly domesticated, and more than earn their subsistence by turning the wheel of a machine which supplies the gardens with water. The varieties of antelopes, deer, and sheep, are numerous.

The Aviary contains a collection of every bird known in France and the neighbouring kingdoms, arranged according to their species and habits; but does not boast of many rare specimens.

The Museum of Natural History is at the end of the garden. The building is more than 600 feet in length, and its external architecture is simple and plain.

The library is first visited; and, although many of its richest treasures have been restored to their proper owners, it contains almost every publication in every language on the subject of natural history. To this subject it is limited. The manuscript figures of Aldrovandi, and the *hortus-siccus* of Haller, are no longer to be seen; but the herbals of almost every celebrated French botanist are open to inspection. At the entrance is a statue of Buffon with its well-known vain-glorious and profane inscription.

Five halls are occupied by an immense collection of minerals. The first room contains the earths and stones. They are arranged according to the classification of Haüy, and mostly by his own hand. Many of the calcareous spars, the gems, and the quartz crystals, are very beautiful. In the second hall are the ores, and they present a most superb display. The third apartment affords specimens of the primary and secondary rocks, with every variety of French marble.

In the fourth is an assemblage of peculiar interest. It is composed of the animal remains of the antediluvian world. The bones of the mammoth are perfect, and strike the beholder with astonishment. The skeletons of numerous animals, now unknown or extinct, are exhibited here. Cuvier arranged the innumerable specimens of this division. All parts of the world have contributed to this collection. Among other wonders, are the fragments of an elephant's tusk, which, when complete, must have been at least eight feet in length. Several cases are filled with the bones of the Siberian mammoth, or elephant, the American mammoth, or mastodonton. There is a specimen of the hair of that mammoth which was found in 1805, preserved in a block of ice on the shore of the Icy Sea, in the country of the Tonguses in Siberia: when extricated, the dogs devoured its flesh, which must have remained in a state of complete preservation for a long period. After the bones of rhinoceroses, hippopotami, and tapiirs, come those discovered by Cuvier in the plaster-quarries of Montmartre, and of which he has constituted several new genera of extinct quadrupeds.

In the next apartment is a more pleasing collection of a similar nature, comprising the vegetable remains of former times, and particularly the impressions of ferns, leaves, and plants, procured from coal-mines, and establishing the vegetable origin or connection of this fossil. A part of this hall is occupied by numerous specimens of volcanic productions, principally from Naples, Sicily, and the Lipari islands. Two other apartments on this floor belong to the museum of zoology, and contain the reptiles and the fish tribes.

The long gallery, on the second floor, is occupied by quadrupeds and birds, generally preserved in a most admirable manner. The collection is said to be complete; and some of the animals and a few of the birds are unique.

They were introduced to the knowledge of Europeans, by Tournefort, Vaillant, and other travellers. Few animals are wanting in the series of quadrupeds and birds. Of monkeys alone there are at least two hundred specimens, and often more of a single family of birds, as of the genera *Motacilla* and *Tanagra*. Here are the camelpard brought from Africa by Vaillant, the bison, the lania, and the vicugna of Peru. Many specimens were presented by the late empress Josephine. There is a regular arrangement of the whole, which adds considerably to their interest and value. In different parts of the gallery appear busts of Tournefort, Linnæus, Adanson, Daubenton, and Fourcroy. The paintings are only two—a lion tearing a goat, and an eagle pouncing on a lamb.

The insects principally occupy large cases in the centre of the gallery, where is likewise a pleasing arrangement of the eggs and nests of most species of birds; and a beautiful assortment of corals, and other marine productions. Among the insects, after the splendid *Papilio*s are glanced at, and the *Sphinges*, may be seen a series of the silkworm, with their cocoons, and the caterpillars, formed of wax so as exactly to resemble the living animals. Near them are the gall-nuts, and woods pierced or formed by insects. Additions, illustrating the history and habits of the insect, are often procured; thus the cunning *Formica leo*, or lion-ant, is placed at the bottom of its sandy pit, down the sides of which insects are crawling, unconscious of their danger.

When the restitution of the treasures from neighbouring countries was determined on, it was rumoured that the allies would not only reclaim what had originally belonged to them, but complete their cabinets at the expense of what really appertained to France. An amicable arrangement, however, took place, creditable to every party. Numerous minerals, and many zoological specimens, had been taken from the Austrian dominions in Italy. When a duplicate existed in the museum of the garden, the original article was restored; but, when the restoration of the purloined mineral would render the French collection incomplete, another specimen of equal value, and of which the Austrian cabinets were not already possessed, was substituted. The Dutch collection, and especially of minerals, had materially enriched the French museum. If it had been restored in its original state, the museum of the Garden of Plants would have been rendered sadly imperfect. A friendly and equitable arrangement was here likewise effected. The greater part of the purloined articles were left untouched, and a collection was formed out of the private store of the duplicates of the museum, more valuable than the original articles could possibly have been. It is said that 260 quadrupeds, 800 birds, 338 reptiles, 800 fishes, and 400 shells, were given to the Dutch, not one of which were drawn from the public cabinet.

The traveller now proceeds to the Cabinet of Comparative Anatomy, originally founded by Daubenton, and newly arranged, and much increased, by Cuvier. It professes to contain, or will ultimately contain, a skeleton of every known animal, with a complete set of the bones of each separated, that they may be more easily compared with those of other species.

In the first of the public rooms are the mummies and skeletons of the human species. One Egyptian mummy, disengaged from its coffin and wrappers, is dry, dark-brown, and with the thighs and arms almost exhausted of flesh. There are male and female mummies of the Guanches, the ancient inhabitants of Teneriffe, white and distorted. A mummy of the ancient Gauls is marked as having been found near Riom. Among the skeletons is that of the assassin of general Kleber, who held for a short time the chief command of the French army in Egypt. An extensive series of human bones illustrates the diseases to which they are subject. The skeletons which follow, and crowd the apartments, are all clean, and comprehend the greater number of quadrupeds. The skeletons

skeletons of birds are not so numerous as those of the quadrupeds; there are many of the amphibia, and one of a crocodile; there are also many skeletons of fishes.

The wax preparations of fishes and shell-fish follow, constructed with the nicest art, and displaying the true colours and position of animals which it is impossible to preserve. The anatomy of the Chiton, for example, is fine. Snails in wax are attached to real shells, and caterpillars to leaves and branches of trees. In one case the anatomy of an egg is displayed in 24 preparations, from the appearance of the first speck of life, to the chicken bursting from its shell.

In the last room are the fœti and monsters. The wax preparations here are of the greatest beauty, and on a large scale; they embrace all parts of the human system, so that one may form ideas of anatomy, without the disgust that attends dissections. The most elegant additions are present; a child reclines on a silken couch, a lady and child are placed on an ornamented sofa, so as to give this science all the attractions of which it is perhaps susceptible.

The following interesting intelligence relative to this valuable Museum has just reached us; (Jan. 1821). M. Lucas, keeper of the cabinet of mineralogy, has terminated a journey that occupied him twenty-one months in Italy and Sicily: he has brought home more than thirty boxes of minerals and other valuable articles collected in those countries. M. Lescchenault de Latour has sent from Pondicherry, a young elephant, living; an antelope, a shoot of the cocoa-tree, a large black squirrel, and a large box containing specimens of plants and seeds. M. Plée, a naturalist in the service of government, is on his journey to Porto Rico. M. Augustus L. Hilaire has given information of his having completed the hazardous and laborious expedition that he had undertaken in South America. M. Milbert, naturalist and draughtsman in natural history, who had been obliged by the state of his health to quit the company of Capt. Baudin, during his expedition in the South, is at present in North America, as correspondent of the Museum: in the space of three years he has sent over fifteen consignments of rare and interesting objects; among them are a bison, several deer of uncommon species, and other living animals never before seen in France. In compliance with the request of the professors in the Royal Botanic Garden, the minister of the marine has nominated M. de Sauvigny to repair to Senegal in quality of botanic agriculturist.

The Amphitheatre faces the garden on the left side. Here the lectures are delivered. The forms of the lecture-room are all constructed in semi-circles, and rise regularly one above another. In the centre below stands the lecturer. There is in the same building a chemical laboratory. The museum is open to the public on stated days, from three o'clock till seven in summer; and from three o'clock till the end of the day in winter. The menagerie is open from eleven o'clock till one; and from three till five. Most of the professors and officers have a free residence in buildings belonging to this museum. The professors deliver public lectures in rotation, during the summer months. The other officers are a principal and sub-librarians, two keepers of the gallery for natural history, a gardener, and a secretary.

Athenæum of Arts, Rue St. Honoré.—This society was instituted in 1792, during the dreadful convulsions of the Revolution; and has uniformly maintained that prudence and moderation, in the course of its most active labours, which should ever characterize the proceedings of the friends of science and the arts. The destructive fire at the Circus, in the garden of the Palais Royal, where this institution held its sittings, compelled its removal to the Oratory of St. Honoré. It embraces every scientific and literary topic; but its principal object is the encouragement of the arts and manufactures. Medals and crowns are distributed to the authors of useful discoveries. No institution has more benefited society, or acquired higher or better-deserved reputation.

VOL. XVIII. No. 127.

The labours of the society are divided into six classes, to the consideration of each of which particular days are devoted. Literature and political economy occupy the Tuesday; the pleasing and fine arts are discussed on Wednesday; and the mathematics and physics on Thursday.

Royal Athenæum of Paris, Rue de Valois.—The programme of this institution, just published for the year 1820, assumes that the Society is now in the 36th year of its establishment, under the successive names of Museum, Lyceum, and Athenæum. It has weathered all the storms of the Revolution, having never suspended its labours or ceased to be frequented. It was established in 1784, by the unfortunate Pilatre de Rozier, under the title of the "First Museum." The extensive patronage which this infant society received, induced the most eminent men in every department of science to unite themselves to it. It then assumed the name of "Lyceum;" and it was at this period that La Harpe first read his admired lectures on general literature, and Delille occasionally recited his exquisite verses. It was afterwards called the "Athenæum of Paris;" but now the "*Royal Athenæum*," for every thing is *royal* at present.

There are three distinct halls: one for conversation and society, another for reading, and a third for the ladies. All the journals and principal periodical works are taken in; and there is a well-furnished library, and a cabinet of natural history, mineralogy, and chemistry.

Conservatoire des Arts et Métiers, Conservatory of useful Machines; Rue St. Martin.—Few museums are more interesting, none more instructive or valuable, than this. It is an immense collection of all the machines invented by French genius and industry, in every kind of manufactory, and every branch of art. It is a collection peculiar and highly creditable to the metropolis of France, and cannot fail of being productive of the most beneficial effects. It undoubtedly has diffused through France a knowledge of mechanics, and a skilful adaptation of the simplest implements to the most complicated purposes, unknown in every neighbouring country.

The first apartment of this spacious conservatory contains specimens of spinning-jennies, and wheels, and carding-mills, employed in the manufacture of cotton thread. They are simple and ingenious; but valuable improvements on them have been recently introduced into the British manufactories.

The second apartment is chiefly filled with the inventions of Vaucanson, the prince of French mechanics. The traveller will particularly notice the enormous machine for spinning cotton. It was much celebrated at its first invention, but the English and German artists have simplified its construction. A more pleasing, but not equally striking object, is the machine for unravelling the web of the silk-worm. Various looms for weaving tapestry and embroidery on stuffs and silks are likewise exhibited. The inhabitants of Lyons having treated some of these inventions with undeserved neglect, Vaucanson attached an ass to one of the looms, who executed a piece of tapestry infinitely superior to any thing which the most skilful Lyonesse manufactures could produce. A pattern of it is shown. Here are also shown the tools which Vaucanson used in the construction of his machines. The one employed for making iron-chains is so simple, that a workman, in less than half an hour, may begin to use it. The strength of man is increased an hundred-fold by such inventions.

In addition to these collections, there is an immense number of machines relative to agricultural labours, such as draining, irrigation, preparation of oil according to the Dutch process, the ingenious machines with which paper-money has been fabricated; among which is the mechanical arithmetician, or marker, of Richer, which, by a single motion of a printing-press, performs all the changes of numbers, in the natural order of the cyphers, from 1 to 9999.

The hall which is next entered is of a different description. It is devoted to improvements in architecture, and contains models of public and private buildings of every description, beautifully executed in wood and ivory.

The stranger is next introduced into the church of the ancient priory. It is principally filled with hydraulic machines. Among them is the ingenious and simple contrivance of Montgolfier, to raise water, commonly called his Ram. Different kinds of fire-engines are next in succession, with some interesting models of fire-ladders and fire-escapes. Numerous mills and ploughs fill the remaining part of the church; but the improvements which the English have made in the latter, have left the boasted agriculture of France far behind.

The traveller is next shown models of every vessel of earthen or stone ware, as appropriated to economical or culinary purposes. To these succeed an infinite variety of lamps, of every form and principle. That which is known in London by the name of the *hydrostatic lamp* was copied from one preserved here. In another lamp the oil is curiously raised by clock-work. The shades of the lamps, of many different materials, and of an endless variety of patterns, will amuse and please. The embellishments on some of them are executed with inimitable taste and elegance.

The steam-engines next succeed; but the Englishman who has seen the grand improvements of Watt and Bolton, will scarcely deem them worth his notice. Numerous syphons, and contrivances for decanting liquors, are ingenious.

The implements of agriculture are now once more brought under review. A great variety of ploughs, harrows, clumsy threshing and winnowing machines, and wine-presses, offer themselves in long succession, interspersed with models of pales, fences, gates, &c. &c.

The next division possesses considerable interest. It is a long range of grates, stoves, chimneys, and furnaces, of various constructions, and on almost every principle. Among these is a model of the kitchen of St. Marie, an hospital at Florence, where twelve pots are boiled, and meat is roasted on three spits, all at the same time, with a very small fire.

A handsome staircase conducts to numerous apartments above. The first object which presents itself is an immense model of the machine of Marli. To this succeeds a long range of models, superior in interest to any thing which the traveller has yet seen. It is a display of every kind of art and manufacture. Small houses, resembling the buildings in which the manufactures are usually carried on, are open in front, and exhibit in their different apartments the various implements and machines employed in each and every stage of the business, from the first operation on the rough material, to its transformation into some elegant or useful article. Nothing can be conceived more pleasing, instructive, and useful, than this. No young person should visit Paris without devoting one or two mornings to the Conservatory, and especially to this division of it. From the most complicated and important manufactory, to the shop of the carpenter, and the forge of the blacksmith, every thing is perfect; not the most insignificant tool is omitted, nor one process forgotten.

Having satisfied his curiosity here, if indeed one or many visits can satisfy it, the stranger is conducted to the models of telegraphs, pile-engines, waggons, carts, carriages of every kind, windlasses, and boats.

Next follow specimens of China, earthenware, and glass; numerous varieties of paper, coloured, stamped, or beautifully cut; types, letters, ornaments for printing and book-binding; contrivances for remedying deficiencies or distortions in the human shape; artificial legs, arms, and eyes; more cotton and silk machines, with a superb and matchless assortment of ribands and silks, not interesting merely to the female visiter, but a pleasing object to every eye; fans of mother-of-pearl and steel; models

to facilitate the study of perspective; models of pulpits, objects of much importance in every French religious edifice; balances of every description; turning-lathes, with exquisite specimens of their effects; thermometers, barometers, magnets, and bronze ornaments; watches, chronometers, and clocks, of every construction. One clock is much admired; it sets in motion an organ, and has on its top an armillary sphere, with a small orrery in the centre, beautifully displaying the motions of every planet.

Every Frenchman is compelled to deposit in this museum a model of all the instruments or machines which he may invent or improve, with a detailed account of their construction and use, and the whole process of the manufactories in which they are employed.

In one of the halls is a superb library, containing every publication, in every language, on the different subjects connected with this excellent institution; and, to render the establishment yet more useful, lectures are delivered by the ablest professors, on geometry and natural philosophy, as applied to the arts and construction of machines, and the processes of different manufactures. These lectures, however, are confined to pupils, who are recommended by the minister of the interior.

The Conservatory is open to the public on Sunday and Thursday, from ten to four; but foreigners are admitted every day, except Friday and Saturday, on producing their passports. This museum was religiously respected during the occupation of Paris by the allies.

Museum of Artillery, Rue de l'Université.—This is the dépôt of every machine invented for the destruction of human beings. It likewise contains a valuable collection of the different kinds of armour used in every period of French history. Among them is the complete armour of Joan of Arc, Godfrey de Bouillon, Francis I. Louis XI. Henry IV. and Louis XIV. Admittance may be obtained on Sunday from eleven until two, by written application to the director.

The Royal Observatory, Rue St. Jacques.—This building was erected by Perrault, under the great Colbert, in 1667. Its exterior is grand, and its aspect imposing. The simplicity of its design, and the harmony of its parts, announce a public edifice of the first order, though erected on a superficies too contracted.

The principal mass is a square with octagonal towers at two of the angles, and a projecting building on the opposite side. It stands exactly north and south, and a meridional line runs through the great hall. It is completely vaulted throughout, and has neither wood nor iron in its whole construction. In this edifice is preserved a circular universal chart, designed upon the pavement of one of the large chambers by Chazelle and Sédillan. There is, also, particularly deserving of notice, a geometrical staircase, which leaves a vacuity or well, 170 feet deep, at the bottom of which the heavenly bodies are visible at noon-day. It was constructed to measure the acceleration of falling bodies. Connected with this well are a series of caverns for experiments on congelation, &c. They communicate with the subterranean galleries formed under Paris by the ancient quarries. Many of the stalactites, formed by the water filtering through the rocks, are of an enormous size, and very beautiful. It is dangerous to enter these caverns without a guide. Three astronomers are always resident on the spot, who have access to a complete astronomical library, and who are furnished with a superb astronomical apparatus.

In addition to this grand observatory, there are five others of considerable consequence, namely, in the Royal College; at the Hotel Cluny; at the Pantheon; at the Military School; and at the former monastery of the Capuchin Friars, in the Rue St. Honoré.

This place commands a fine view of the palace and garden of the Luxembourg.

UNIVERSITÉ ROYALE DE FRANCE: Rue de Bourbon.—The Royal University is indebted for its origin to the illustrious Charlemagne. It was suppressed in 1792, but has

has since been re-established on a more extensive plan. It consists of four colleges, viz. of Theology, Law, Medicine, and the Sciences. These colleges are situated in different parts of the city, but their principal sittings are held, most of their examinations passed, and their degrees conferred, here. The royal university is charged also with the superintendence of the business of education in every department of France; nor can any school or place of instruction be established without its authority. The Colleges of the University are situated in the following places:

Faculté de Théologie, Faculty or College of Theology; Rue St. Jacques.—Six professors are established here, who give lectures on logic; on ethics; on ecclesiastical history and church-discipline; on Hebrew; on the study of the scriptures; and, on pulpit-eloquence.

Faculté de Droit, College of Law; Place St. Geneviève.—The Doric portal of this beautiful building has a majestic appearance. The interior is commodiously distributed into numerous spacious halls, where seven professors stately lecture: one on the Roman law; four on civil law; one on the Practice of the Courts; and one on the Laws of Commerce. Every student must regularly attend during two years to obtain the degree of bachelor; three years for that of licentiate; and four for that of doctor.

Ecole de Chirurgie, School of Medicine and Surgery; Faubourg St. Germain.—This noble edifice consists of four buildings, enclosing a spacious court. The façade towards the street presents a peristyle of four ranks of colossal Ionic pillars, supporting an attic, which contains the library and the cabinet of anatomy. Above the peristyle is a bas-relief, thirty-one feet in length, in which the Government is represented, accompanied by Minerva and Generosity, offering the Plan of the Surgical School to Hygeia, the goddess of Health, attended by Vigilance and Prudence. Five medallions display the portraits of the famous Petit, Marechal, Pitard, Lapeyronie, and Paré. The paintings which decorate the interior, are from the pencil of Gibelin; and the amphitheatre is capable of containing 1200 persons. The theatre is at the bottom of the court. In the two wings are spacious halls for demonstrations, and for the meetings of the members of the college. The ornaments of some of these are characteristic, and well executed.

This is the first medical school in France, and probably in Europe. It has one peculiar advantage, that not only the morbid and healthy anatomy of the frame are demonstrated by dissections, not only the most excellent lectures are delivered on the various diseases to which the body is subject; but an hospital is attached to the institution, into which those who labour under rare or peculiarly interesting diseases are gratuitously received. Chaussier and Duméril lecture on anatomy and physiology; Deyeux and Vauquelin, on medical chemistry and pharmacy; Hallé and Desgenettes, on the philosophy of medicine; Percy and Richerand, on external pathology; Pinel and Bourdier, on internal pathology; Jussieu and Richard, on medical natural history and botany; Pelletan, Boyer, Corvisart, and Leroux, give clinical lectures; Leroi and Desormaux lecture on midwifery; Sué, on forensic medicine; and Thillaye, on the materia medica, and the use of instruments.

A branch of this institution, but confined more to the practice of physic than surgery, is in Rue de la Bucherie.

Another branch, confined principally to pharmacy, is in Rue de l'Arbalète, (Cross-how-Street.) Lectures are delivered here, during the spring and summer, on botany, chemistry, and pharmacy. All apothecaries, practising in Paris or the departments, must obtain a diploma from this school. The examinations are said to be impartial, yet severe. The botanical garden is open every day except Sunday, and is worth visiting.

We are told in the newspapers, that the king, by an ordonnance issued on the 20th of December, 1820, has instituted a "Royal Academy of Medicine," which is to

be divided into three branches, physic, surgery, and pharmacy. We suppose it to be only an extension, or re-christening, of the above college, or faculty, of the Royal University. It is added, that a certain number of foreigners are to be admitted as associates in these three branches.

Faculté des Lettres et Sciences, College of Letters and Sciences; Rue St. Jacques.—The first division of this college boasts of some of the most illustrious names in the republic of letters. Boissonnade now lectures on Greek literature; Guérout and Delaplace, on Latin eloquence; Lemaire, on Latin poetry; De Guerle and Laye, on French eloquence and poetry; Laramiguière, on philosophy; Roger-Collard and Millon, on the history of philosophy; Lacretelle and Guizot, on ancient and modern history; and Barbier du Bocage, on geography.

COLLEGE ROYAL de FRANCE, the Royal College; Place Cambray.—Francis I. established this seminary in 1531. Many students are gratuitously educated here; and public and gratuitous lectures are daily delivered. This institution can boast of the erudite Ramus, the indefatigable Daubenton, the chemist Fourcroy, and formerly of the poet Delille, among its professors. Delambre now lectures on astronomy; Mauduit, on geometry; Biot, on physics; Portal, on anatomy; Thenard, on chemistry; and Cuvier, on natural history.

Ecole Militaire, the Military School.—This building occupies a vast space near the Invalids, in the plain of Grenelle. Its principal entrance towards the city is on the square of Fontenoy. The grand façade is opposite to the Champ de Mars and the bridge of Jena. It was erected in 1751 by Louis XV. under the superintendence of the architect Gabriel. Two courts, the first of which is 420 feet square, and the second 270 feet, and surrounded by an arcade, supported by clustered Doric columns, conduct to the principal front towards the square of Fontenoy. In the centre a projecting building of the Corinthian order presents itself, with eight columns sustaining an entablature. Two pediments, painted in fresco by M. Gibelin, in imitation of bas-relief, have considerable effect. That on the right represents two athletes, one of whom is stopping a furious horse; the other contains an allegorical figure of Application, surrounded by the attributes of the arts and sciences. The façade towards the Champ de Mars has likewise a projecting building in the centre, composed of Corinthian columns, surmounted by an entablature decorated with bas-reliefs, and accompanied by pedestals supporting trophies of arms and statues. The dome has a large and curious fun-dial. The figures of Time and Astronomy at the base have been much admired. In the council-chamber are four paintings, representing the battles of Fontenoy and Lafelt, and the sieges of Tournay and Fribourg. Three paintings hang over the portal, representing the sieges of Menin, Ypres, and Furnes. The other parts of the edifice and the gardens are in a very simple and pleasing style.

This institution was appropriated to the instruction of young men of good family, but who were either possessed of small fortune, or whose fathers had fallen in the service of their country. It long served as a barrack for the imperial guard; but it has been restored to its original and benevolent destination by Louis XVIII.

In the area of the *Champ de Mars*, in front of this building, twenty thousand soldiers can be exercised at once; and all the inhabitants of Paris might be spectators from the rising banks which form a kind of amphitheatre. A double row of trees, which extends from the Military School to the river Seine, lines its outside and inside. Here Louis XVI. took the oath to preserve the constitution, in the presence of six hundred thousand persons, on the 14th of July 1790; and here also was exhibited the celebrated *Champ de Mai*, during Napoleon's second usurpation, in 1815.

Ecole Polytechnique, the Polytechnic School; Rue de la Montagne.—This school, which holds the most distinguished

guished rank among the establishments of Paris, is intended to complete the education of the students who have rendered themselves conspicuous in other institutions, and particularly to form them for the artillery, or to train them up as engineers. No officer is admitted into the artillery who has not been educated in the Polytechnic School. The most distinguished masters in every branch of science are employed by the government. Every year a certain number of scholars are admitted, after undergoing the most rigorous examination in the classics, the mathematics, mechanics, and drawing.

The number of pupils amounts to 300. The usual course of study is three years. The school possesses an excellent philosophical and chemical apparatus, and a well-selected library containing 10,000 volumes. Government pays all the expenses of instruction, but 800 francs per annum are required from every pupil for his board and lodging.

Ecole Royale des Ponts et Chaussées, Royal School of Bridges and Roads; Rue Ste. Catherine.—Eighty pupils, selected from the Polytechnic School, are here taught every branch of science connected with the construction of bridges, canals, harbours, roads, and public edifices. The museum contains a noble collection of plans, charts, and models.

Ecole Royale Gratuite de Dessin, Royal free Drawing-School; Rue de l'Ecole.—This unique but useful establishment was founded by M. Bachelier, in 1767. Its purpose is to diffuse scientific principles among the lower classes of mechanics. Fifteen hundred persons often assemble here. Medals are distributed every month, and prizes every year. There are lectures every Monday on practical geometry, arithmetic, and admeasurement; every Thursday on architecture; Tuesdays and Fridays on the proportions of the human figure and of animals; and Wednesdays and Saturdays on ornamental architecture.

In the Rue de Touraine, there is a school particularly appropriated to teaching young women to draw. This is also at the expense of the government; and there is an annual exhibition of the best performances, and medals are distributed to the deserving.

Ecole des Mines, School of Mineralogy.—This institution is situated in the principal court of the Mint. It was begun in 1778, with the collection of the famous chemist Le Sage, who spent forty-three years in this particular pursuit. The centre of the cabinet, contains an amphitheatre capable of receiving two hundred persons. Large cases with glass doors enclose specimens of all the minerals, scientifically arranged. Four other cases, placed in compartments between the pillars, display various models of curious machines. One of the cabinets encloses the analysis of every specimen. Upon the first landing-place of the staircase conducting to the gallery, is a bust of Monf. Le Sage, which was consecrated by the gratitude of his pupils. This gallery is surrounded with cases containing specimens of minerals, far too numerous to be placed in due order after those which are ranged in the lower cabinets. The cupola, which rises above, is finely enriched with painted pannels, and decorated with gilding. The interior of this museum is 45 feet long, 38 feet wide, and 40 feet in height. This splendid museum was untouched by the allies. The collection of medals, one of the most perfect that France contained, has been removed to the Royal Library.

At this school twenty pupils are admitted; they are instructed in every art connected with metallurgy and the working of mines. Vauquelin is the inspector of the laboratory, and Haüy the superintendant of the minerals. Public lectures are delivered during five months, on Monday, Wednesday, and Friday, at noon; beginning in November.

Ecole Royale Vétérinaire d'Alfort, Royal Veterinary School.—This excellent institution was founded by Bourgelet in 1766, and has since been peculiarly and deservedly fostered by government. Every department may send

three pupils, and every regiment of cavalry one, who are boarded and instructed at the expense of government; but numerous pupils are sent to the college at the expense of their friends.

This institution is the noblest of the kind in Europe, and is conducted on principles which tend more to the improvement of the art than the emolument of the professors. Lectures are delivered, by seven of the most eminent teachers, on the anatomy and physiology of every domestic animal, the treatment of their diseases, and their management in the field and the stable; natural history, botany, pharmaceutical chemistry, the materia medica, the operations of the forge, veterinary jurisprudence, and the theory and practice of rural economy. A residence of five years is required before the student is authorized to practise as a veterinary surgeon.

The school contains a most valuable cabinet of natural history and comparative anatomy, admittance to which may be easily obtained.

Ecole Normale, Rue des Postes.—This singular and useful establishment has for its object to train up proper persons as professors in the different colleges, and instructors in the various seminaries of France. The course of study is exceedingly severe, and is adapted to elucidate the talent of the pupil for communicating as well as receiving instruction.

Lyceums.—There are four Lyceums, or public schools, in which the pupils enjoy a complete course of collegiate education: Lycée Louis-le-Grand, Rue St. Jacques; Lycée Henry IV. Place St. Geneviève; Lycée Bourbon, Chaussée d'Antin; Lycée Charlemagne, Rue St. Antoine. The pupils pay 1000 francs per annum; and, at a yearly meeting of the scholars of all the Lyceums, numerous prizes are awarded.

Beginning at the Palais des Beaux Arts, which is the seat of the Royal Academy, we have been induced to include under that head as it were, our account of all the principal institutions for the promotion of science and literature. We shall now conclude our enumeration of public buildings.

PALAIS d'ÉLYSÉE BOURBON, Rue St. Honoré.—This palace, remarkable for its luxurious elegance, was built by the comte d'Evreux in 1718. Madame de Pompadour afterwards possessed it. It next became the appointed residence of the foreign ambassadors extraordinary. In 1773, it was purchased by the financier Beaujon, who considerably embellished it; and shortly after it came into the possession of Madame de Bourbon.

During the early years of the Revolution, the government printing-office was established in this palace. It afterwards belonged to Murat, who yielded it to Bonaparte, to whom it owes all the decorations of the interior. During the first visit of the allied monarchs, it was the residence of the emperor of Russia. On the return of Bonaparte from Elba it became his favourite abode, and it received him after his escape from the fatal field of Waterloo. At his final departure, it became the habitation of his conqueror; the duke of Wellington established himself there. It is now the residence of the duke of Bourbon.

PALAIS de la LEGION d'HONNEUR, formerly Hotel de Salm; Rue de Bourbon.—The Hotel de Salm, built a little before the Revolution, was one of the most elegant edifices which Paris contained. Its only defect was, that it resembled some public building rather than the house of an individual. The purpose to which it is now devoted has completely removed this objection. Towards the Rue de Bourbon it presents a triumphal arch, flanked by a colonnade of the Ionic order, terminated by two handsome lodges. This encloses a spacious court, at the bottom of which is the grand front of the palace. It consists of a noble portico of the Corinthian order, on each side of which is a colonnade of the Ionic order. The principal saloon rises in the form of a rotunda, the cupola of which is enriched with some exquisite paintings, descriptive

scriptive of the establishment of the legion; and round the saloon will be placed the statues of those deceased members who may be deemed worthy of that distinction. The apartments are adorned with elegant simplicity.

In the Rue Barbette, there is a Royal Establishment for the Orphan Daughters of the Legion of Honour, in which 300 females, daughters of the officers, are educated by nuns.

PALAIS des THERMES, Palace of the Warm Baths; Rue de la Harpe.—Let not our reader be surprised that we rank this little, but precious, relique of antiquity, among the palaces of the metropolis. Inconsiderable as it now appears, it was once the residence of the Roman emperors, and in later times the chosen habitation of the kings of France. It is supposed to have been built and inhabited by Julian the Apostate about the year 357. There remains only a noble hall roofed by a lofty arch, much admired by the antiquary. The arch, like those of all the Roman buildings, is composed of bricks and stone, cemented by a mortar which modern ingenuity has not yet equalled. For many revolving ages it has supported a garden, the mould of which is at least four feet thick; and, although this has been constantly moistened by the rain, and by artificial means, not the least damp has yet penetrated the vault. Beneath is a double row of caves, or vaults, nine feet in diameter, the intention of which is not known. These ruins were lately occupied by a cooper, as noticed at p. 447, but have been purchased by the French government for the reception of the monuments of antiquity, from the Petits Augustins.

The **HOTEL de VILLE**, or Town Hall; Place de Greve.—This edifice was begun in 1533, after the designs of an Italian architect named Boccadoro, sometimes called Cortona: it was not completed till the year 1606. It is regular in its architecture, convenient for the purpose for which it was designed, and rich in beauty and ornament. An equestrian statue of Henry IV. in bas-relief, is placed over the principal entrance; but that entrance is far too small for the great extent of the Hotel. The apartments are extensive, handsome, and commodious. The clock is a very celebrated piece of mechanism. The Hotel de Ville is worthy the traveller's attention, on account of its antiquity, and the extraordinary scenes which it has witnessed. When the king was brought from Versailles, he was exhibited to the populace from one of the windows of this mansion. Hither Robespierre retreated after he had been outlawed. In front of the Hotel de Ville is the famous lamp-iron; and within the building is preserved the still more celebrated guillotine.

The **Place de Grève**, in front of this building has been used for magnificent fêtes. It is also the appointed scene of public executions; and its name revives the most odious recollections. It is painful to learn that innocent blood was the first that flowed here: an unhappy female heretic named Margaret Porette, scarcely thirty years old, was burnt here in 1310, for having written, "that the soul, absorbed in God, is at the height of every virtue, and has nothing more to do; and, that when a certain degree of virtue is attained, one cannot go beyond it." Previously to this execution, criminals were put to death in the market-places, which still participated, for more than a century, with La Grève, the miserable prerogative of scaffolds. Here were decapitated, in 1398, the two Augustin monks, who had engaged, for a large remuneration, and on the penalty of their lives, to cure Charles VI. of an incurable malady with which he was struck. The two friars lost their heads; and the king did not recover his own senses. The last execution which took place in a market place, in 1477, was that of the unhappy duke of Nemours, whose children, placed on the scaffold by order of the cruel Louis XI. were covered with the blood of their father. Since that epoch, every sentence

of death passed at Paris has been executed at the Place de Grève, except those ordered by military tribunals.

The **Church of St. Gervais** is near the Place de Grève.—The portal to this church, which is the object that principally deserves the traveller's attention, was rebuilt by Louis XIII. in 1616. Some critics have censured the distribution of minuter parts: but the happy union of the Doric, Ionic, and Corinthian, orders, the immense span of the arches, and the character of boldness, yet severity, which prevails, must produce a pleasing impression on the mind. The interior of this building is in harmony with the purpose for which the edifice was erected. The little chapel of the Virgin, apparently suspended from the roof of the church, is an object of much curiosity.

HOTEL des MONNAIES, the Mint.—Till the year 1771, Paris was destitute of a Mint worthy of the capital of a great nation. The ancient edifice which was appropriated to that purpose, and which was situated in the street that now bears its name, opposite to the Pont Neuf, was in ruins. The architect Antoine was appointed to construct a new building on the site of the ancient Hotel Conti. The Hotel des Monnaies was erected, and it forms one of the noblest ornaments of the banks of the Seine. The principal front towards the quay is 360 feet long, and 84 in height. It is ornamented by a projecting building, formed by six Ionic columns, placed on a sub-basement of five arcades. A grand entablature crowns the whole length of the edifice. The projecting building is surmounted by an attic, on which are six detached figures, representing Law, Prudence, Fortitude, Commerce, Abundance, and Peace. The front towards the Rue Guenegaud offers an attic on a sub-basement, of the same height as the preceding. On a projecting building in the centre are figures representing the four Elements. The chief entrance to the Mint is formed of a superb vestibule, ornamented by twenty-four Doric columns. On the right is a magnificent staircase, decorated by sixteen Ionic columns, and conducting to the principal halls.

The Salle des Balanciers is distinguished by four columns of the Tuscan order, which support its vault, and at the end of which is a statue of Fortune by M. Mouchi. The upper apartment of the same size contains places for a hundred *ajusteurs*. The Moulins à Laminage are in another room contiguous to that of the balanciers. The entrance to the chapel is underneath one of the arcades on the right of the court: this chapel receives most of its light by a small cupola in the centre ornamented with caissons.

Every branch belonging to coining is performed within the circuit of this building. Here is also a kind of Assay-office for the gold and silver of Paris; and it is the seat of the Administration générale des Monnaies.

THE BANK, Rue de la Vrillière.—Francis Mansard built this hotel for the duke de la Vrillière. It was afterwards the property of the comte de Toulouse, and then of the duke de Penthièvre. When it was determined to fix the Bank of France here, the architect Delaunay was employed to prepare it for its new destination. He has neglected nothing for the security or convenience of this important establishment. The two figures upon the entablature represent Minerva and Mercury.

The Bank of France has, by the laws of the 14th of April, 1803, and of the 22d of April, 1806, the privilege of circulating bills, payable to the bearer, or at sight. This privilege was granted for forty years, to commence on the 23d September, 1803. According to these statutes, and the imperial decree of the 16th January, 1808, it has established houses for discounting in every town of the departments where the nature of the commerce requires them.

The currency of France is almost entirely metallic, there being only one bank, the circulation of which is, in a manner, confined to the metropolis; the branch

banks at Lyons and Rouen finding it very difficult to extend their issues. The Bank of France is a very solid establishment, possessing funds to the amount of 4,500,000*l.* while its paper in circulation seldom exceeds 3,000,000*l.* Though, on all permanent loans, the rate of interest in France is considerably higher than with us, being generally from 6 to 7 per cent, the bank discounts mercantile bills at so low a rate as 4 per cent. The discounting-days are Mondays, Wednesdays, and Fridays, in each week. To be admitted to discount, and to have a running account, it is necessary to write to the governor, accompanied with a certificate signed by three well-known persons.

The amount of the metallic currency in France cannot be short of 90,000,000*l.* sterling; and saving-banks, *caisses d'épargne*, have been lately introduced. Another very laudable establishment is the

Mont de Piété, Rue des Blancs Manteaux.—Here small sums are advanced to the poorer classes at little interest, on the deposit of some security or property. It is open from nine till two, and from four to seven.

Its architecture is simple: the gate towards the street is surmounted by a large pediment, supported by two keys adorned with garlands. The hall on the side of the Rue Paradis, is sustained by Tuscan columns, which have a noble effect.

THE ROYAL PRINTING-OFFICE, formerly l'Hotel Soubise; Rue du Paradis.—This ancient hotel was the residence of the constable Oliver Clisson. It was then called the Hotel of Mercy, because, after a popular tumult, Charles VI. assembled the citizens, and converted the punishment of death, to which many of them were exposed, into a trifling pecuniary fine. It afterwards became the property of the dukes of Guise, whose name it bore until 1697. Francis de Rohan, prince de Soubise, then purchased it. In 1712, cardinal Rohan erected a new palace close to the former, which he called Hotel Cardinal. The front of this last hotel towards the court is very simple. On the garden side it is ornamented by Doric and Ionic columns, surmounted by an attic, and terminated by a pediment.

The front of the Hotel de Soubise is composed of sixteen columns of the Composite order, eight of which form a projecting building, surmounted by Corinthian pillars, and crowned by a pediment. The other eight columns support four statues, and some groups of infants by Le Lorrain. Above the pediment are two statues, representing Fortitude and Wisdom. The new court, of an elliptical form, is surrounded by a gallery of fifty-six Composite columns; over which are a terrace and a balustrade. The effect of the whole is unusually grand. The entrance is decorated, within and without, by double columns. The vestibule and staircase are large and beautiful, and ornamented with paintings by Brunetti.

The Hotel de Soubise is now appropriated to the reception of the archives of the city. The Hotel Cardinal is converted into the royal printing-office. The collection of types, of every age and character, is immense. It contains no less than 250 presses, and is well worthy the attention of strangers. During the reign of Napoleon, the pope visited this wonderful establishment, and the directors presented him with the Lord's Prayer printed in fifty different languages, and all of them struck off during his visit.

CHURCHES, CEMETERIES, &c.

There are thirty-nine parochial and other churches in Paris, in which there is solemn service twice every day, that is, at eight and ten o'clock in the morning, and evening service at three and five every Sunday and holiday; besides low masses every hour from six to twelve. On the week-days there are low masses only. Of these churches it will be sufficient to name those which are most remarkable for their antiquity or architectural beauty.

NOTRE DAME.—This celebrated cathedral, the mother-

church of France, is so surrounded with houses, that there is no spot from which it may be seen with advantage. It is the most ancient religious edifice in Paris. The episcopal see is also of the greatest antiquity, deriving its foundation from Denis, the tutelar saint of France. It was erected on the ruins of a temple consecrated to Jupiter, Castor, and Pollux, by the merchants of Paris, in the reign of Tiberius. Some ancient inscriptions to this effect were found in the beginning of the last century. This church was named after St. Denis till 522, when it was rebuilt under Childebert I. and dedicated to the Virgin Mary. The building of the present day derives its origin from the time of king Robert the Devout, about the year 1010; but some antiquaries date its foundation under Louis the Young about the year 1177.

Its architecture, although Gothic, possesses something so singular, so bold, and at the same time so delicate, that it has ever been esteemed one of the handfomest structures in the kingdom. It is 414 feet long, 144 wide, and 102 in height, without comprehending the space allotted to forty-five chapels, and the astonishing thickness of the wall. One hundred and twenty enormous columns, which support this edifice, form a double colonnade extending the whole length of the fabric. The western front presents a venerable portico, to which was formerly an ascent of thirteen steps. It contains three portals. The centre portal is of modern architecture; the other two are antique, and are remarkable for a multiplicity of ornaments in the style of the Lower Empire. The centre portal is likewise surrounded by innumerable decorations, but they are evidently of later date. Above them is a gallery, supported by columns, in the intervals of which are twenty-eight statues of the kings of France, from Childebert to Philip-Augustus. Over the side portals rise two immense towers, forty feet square, and two hundred and four in height. They command an extensive view of Paris and its environs, but their heavy appearance ill accords with the building to which they belong. Between these towers, and over the window that enlightens the nave, is a second gallery, supported by Gothic columns of exquisite delicacy. The whole of the exterior is surrounded by three galleries; the first over the chapel, the second above the internal galleries, and the third around the dome. These render almost every part of the structure easily accessible. This front is the subject of the annexed Plate.

The choir is truly superb. The modern ornaments of it were commenced by De Cotte, principal architect to the king, in 1669, and finished by his son in 1714. In the centre is a brazen eagle, seven feet high, and three feet from wing to wing. Two pilasters of wood at the entrance of the choir, adorned with grotesque sculpture, support two angels in bronze. The elegant stalls which line the two sides of the choir, are terminated by two of superb workmanship, appropriated to the archbishop. The wainscot is covered with numerous curious and well-executed bas-reliefs, representing the life of the Holy Virgin. The stalls are surmounted by a cornice of rich design, the upper part of which contains eight fine paintings, by the most celebrated masters of the French school: the Annunciation of the Virgin, by Hallé; the Visitation of the Virgin, the chef-d'œuvre of Jouvenet, who painted with his left hand after his right had become paralytic; the Birth of our Saviour, by Philip de Champagne; the Adoration of the Magi, by Lafosse; the Presentation of our Saviour in the Temple, by Louis Boullogne; the Flight into Egypt, by the same artist; the Presentation of the Virgin in the Temple, by Philippe de Champagne; and the Assumption of the Virgin, by Antoine Coyvel. The choir was formerly adorned with stone sculptures, representing the history of Genesis. On the outside, the history of the New Testament was described. A few grotesque figures yet remain, and show the extraordinary style in which these performances were executed.

Some

J. Chapman, Sc.

West Front of the Cathedral of Notre Dame.

Engraved for the Encyclopædia Londinensis, May 1821.

Some steps of Languedoc marble conduct to the sanctuary, the altar of which has been justly admired. It is three feet and eight inches long, three feet high, and stands on eight circular supporters of the same marble. In front are three bas-reliefs. That in the centre by Van-Cleve, represents Jesus Christ in the tomb; on each side are Angels in the attitudes of grief, by Desseine. The steps of the altar, which are of white marble sprinkled with golden stars, support six gilt candlesticks, nearly five feet in height. In the middle of a recess is a grating of gilt brass, on which is sculptured the Paschal Lamb. Above this is a gilded cross, more than seven feet high. The pavement is a rich mosaic, and the arches above are inlaid with white marble. The bottom of the sanctuary is occupied by a group representing the descent from the cross, in Carrara marble. It is the best work of the elder Coustou, and well merits the closest attention.

The devotee will not fail to inquire for the relics which this sanctuary contains. Among other inestimable treasures, a veritable portion of our Saviour's crown of thorns, and a piece of the true cross, are shown. The regalia of Charlemagne, and many gold and silver vases, are likewise exhibited.

The Chapel of St. Geneviève, on the right, has been lately repaired. The wainscot that now adorns it was taken from the ancient hall of the Chapter of Notre Dame, and was constructed about the beginning of the sixteenth century. It represents the apostles and some of the saints, separated by little pilasters tastefully ornamented. Under the tower, on the side of the cloister, is a tablet of stone sculptured in the sixteenth century, which describes, in a bold and striking manner, the universal judgment.

This noble edifice, prior to the Revolution, possessed much rich tapestry, stained-glass windows, tessellated pavements, magnificent monuments, and the most richly variegated shrines. Too many of these were, during the reign of anarchy, removed or destroyed. Every exertion has since been made to restore or replace them; and the church of Notre Dame is once more an object of curiosity to the traveller and the antiquary.

Adjoining to it is the Archiepiscopal Palace, a heavy building, which forms a strange contrast with the elegant structure of the cathedral. It is a curious circumstance, that, in the hall of this very palace, the National Assembly held that sitting at which all the possessions of the clergy were declared to be national property.

ABBAYE ROYALE de St. GERMAIN des PRÉS, Royal Abbey of St. Germain in the Fields.—This church was built by Childebert, in 558, on the ruins of an ancient temple of Isis. Nothing could be more magnificent than the interior decoration of this temple, built in the form of a Roman cross, 200 feet in length, 65 in breadth, and 59 high. It once contained some exquisite specimens of ancient sculpture, and a noble library of more than 100,000 volumes; but during the Revolution, it was shamefully pillaged and defaced. It is yet worthy of the traveller's attention, from the traces of true antiquity which it affords. It contains the remains of most of the ancient kings. The portal to the west has a majestic appearance; though, perhaps, it more resembles the entrance to a magnificent castle than a church. The principal altars are now re-established. Pope Pius VII. laid the first stone of the altar of the chapel of the Virgin behind the choir. The chapel of St. Marguerite is tastefully decorated; and the tones of one of the finest organs in Paris again resound along the fretted roof.

St. ETIENNE DU MONT; Rue Ste. Geneviève.—St. Geneviève, so celebrated in the French calendar, and whose name is intimately connected with the conversion of the first Parisian monarch, died in 512, and was buried in a chapel near this spot. The sanctuary which contained her remains was enriched by every succeeding monarch; and the Royal Abbey of St. Geneviève was founded in honour of the tutelary saint of Paris. The church of St. Etienne du Mont was afterwards erected as a chapel of

ease for the vassals of the royal abbey. To preserve it from the jurisdiction of the archbishop of Paris, it was built without any external door; and the only access to it was by a covered passage from the Abbey of St. Geneviève. When it was rebuilt in 1491, by Francis I. it yet retained this whimsical peculiarity; and it was not until 1610, that queen Marguerite, wife of Henry IV. constructed the present portico.

Of the Abbey of St. Geneviève, and its celebrated church, few vestiges remain; but this appendage to the grandeur of the ancient monastery has defied the ravages of time. Its architecture has been much admired. The front is peculiarly grand. It is composed of four banded Ionic pillars, supporting a triangular pediment; the ornaments of which, though a little confused, remind the spectator of the peculiar style of Roman architecture.

The interior of the church is remarkable for its boldness and singularity. It is a strange, yet not unpleasing, mixture of the Greek, the Gothic, and the Arabic. Behind the choir, on a platform supported by four pillars of the Tuscan order, is a new shrine, in the form of a Gothic church, containing the relics of St. Geneviève. In one of the side-chapels is the ancient tomb of this saint. In this church also were buried the venerable Pascal, the poet Racine, the painter Le Sueur, and the botanist Tournefort; but the place of their sepulture is not distinguished by the slightest monumental inscription.

Over the altar is the Martyrdom of St. Stephen, by Le Brun.

A library occupies the upper part of the ancient Abbey of St. Geneviève, and contains 80,000 printed volumes, and 2000 manuscripts. It is in the form of a cross, lighted by a small dome in the centre, the cupola of which was painted by Restout the elder in 1730. It delineates the Apotheosis of St. Augustine. The painting at one extremity of the building is by Lejoux, and forms a complete illusion. Many busts of eminent men, from the chisel of Girardon, Coysevox, Coustou, and other sculptors, ornament this library. At the entrance of the Cabinet of Antiques is a plan of the city of Rome, in relief, and coloured, the work of Grimani, in 1776. This library is open every day from ten o'clock till two.

St. LOUIS and St. PAUL; Rue St. Antoine.—This church is in the form of a Roman cross, with a dome in the centre. Its portal is lofty, and composed of three rows of columns above each other: two are Corinthian, and one Composite. A profusion of ornament, employed without regularity of taste, offends the eye of the connoisseur, and does little credit to the skill of the architect. Marble, silver, and gold, are employed with boundless prodigality in the decoration of the grand altar and the chapels. On the right of the sanctuary was the heart of Louis XIII. enclosed in a heart of gold, supported by two angels of silver, modelled by Sarrazin. On the left was that of Louis XIV. supported likewise by two angels, the workmanship of Coustou. This last monument cost 600,000 francs. Near the place where these stood, was a mausoleum, less rich, but remarkable for the propriety of its design and the delicacy of its execution. It was destined to receive the hearts of the heroes of the house of Condé. Sarrazin modelled the ornaments, and Persan cast the figures. Not far distant were the tombs of the princes of the house of Bouillon. Numerous paintings of the French and Italian schools once enriched this temple, and caused it (like St. Germain l'Auxerrois) to resemble a superb museum, constantly thronged by strangers and artists. Few of these have survived the ravages of the Revolution.

St. MERRY; Rue St. Martin.—A chapel existed here in the sixth century, dedicated to St. Peter. It afterwards took the name of St. Merry, who was here interred. The present building was erected in 1520. Its architecture is Gothic; and, although it does not often excite attention by its exterior, its interior is most splendidly ornamented. The choir was decorated with much taste by the brothers Slodtz, in the last century. It is covered with stucco resembling

sembling marble, and enriched with much gilding. At the bottom of the sanctuary is a Glory, which has a pleasing and even sublime effect.

In the Chapel of the Communion is a noble painting of the Pilgrims at Emmaus, by Coypel. The chapels in the transept contain some interesting paintings; particularly St. Merry, by Vouet; the Virgin and Infant Jesus, and St. Charles, by Carlo Vanloo; and St. Peter by Restout. On the left is a descent which conducts to a subterranean chapel.

EGLISE de la MADELAINE, Rue Royale.—This church which was to have been named "The Temple of Glory," and dedicated to those who died while fighting their country's battles, was begun before the Revolution, then taken down, and afterwards restored. It is mentioned here on account of its singular form, and bad architecture. It resembles a tower, surmounted by a spherical dome sixty-two feet in diameter. The cupola forms an unpleasing termination to the tower; and, when viewed from the top, its height gives it more the appearance of a well, than a skilfully proportioned building.

St. EUSTACHE, Parish Church of the Third Municipality.—This vast edifice offers a strange mixture of the Arabian and Greek architecture. The columns which support the interior are altogether without proportion. When the traveller compares their lightness with their height, he trembles lest they should yield to the superincumbent weight. The front is of modern architecture. It consists of the Ionic and Doric orders above each other, crowned in the centre by a small triangular pediment, with (formerly) two square towers at the extremities. One of these towers is now demolished. This church suffered much from revolutionary anarchy; but most of its valuable paintings and sculptures have been restored.

ABBEY du VAL de GRACE, Suburb of St. James.—This edifice, once appropriated to religious worship, is now converted into an hospital-magazine. The peculiar beauty of the structure is, however, carefully preserved. The marble pavement, and the paintings of the dome by Mignard, are uninjured. These last constitute the noblest work in fresco which France possesses. They contain more than 200 colossal figures, representing the glory of the saints in heaven. Molière has celebrated this performance of Mignard in a poem written expressly on the subject.

The edifice was destined to contain the hearts of the royal family of France, and particularly those of the house of Orleans, while their bodies rested in the cathedral of St. Denis. A beautiful enclosure in the chapel of the dome formerly contained more than thirty of these precious relics.

St. FRANÇOIS XAVIER, or the Church of the Foreign Missionaries; Rue de Bac.—The cure of this church is the superior of the seminary for the education of persons intended to spread the knowledge of the Gospel among the Indians. The building contains nothing remarkable but a fine painting, by Carlo Vanloo, representing the Adoration of the Magi.

La SORBONNE.—This chapel is degraded into an hospital. It was once much celebrated for its magnificence, but it is now rapidly becoming a mass of ruins.

St. ROCH, Parish Church of the Twelfth Municipality.—This edifice was begun by Mercier, in 1673, and not finished until 1736. The portico is composed of two orders of architecture, the Doric and Corinthian, supporting a triangular pediment, and is remarkable for its lightness and simplicity. In the interior of the church, a richness and lightness of ornament, almost theatrical, are substituted in the room of that grave and majestic style which should characterize a place of religious worship. Being placed in a part of the city principally inhabited by rich citizens, it was gradually filled with sculptures and paintings. It suffered much during the frenzy of the Revolution, and has not yet recovered its former splendour.

Behind the choir are three chapels. The first, dedica-

ted to the Virgin, is of a circular form, and its cupola ornamented by a magnificent painting in fresco, by Pierre: the Virgin appears to be surrounded by four distinct companies, consisting of the Patriarchs, the Prophets, the Holy Women of the Old Testament, and the Apostles and Martyrs of the New Covenant. The spectator deeply regrets the injuries which this sublime composition has received, the unity, arrangement, and execution, of which excite his warmest praise. The cupola of the second chapel describes the Triumphs of Religion, to which it is dedicated. Two small portals conduct to the third chapel, whose solemn style of architecture, whose obscurity, and the sombre tint of the walls, are calculated to impress the mind with religious awe. It contains a fine painting of the Crucifixion. The light falling on it from above, gives it a wonderful effect, and singularly contrasts it with the cavernous darkness of the chapel.

This church contains several other chapels. One on the right, covered with black marble spotted with white tears, announces that it was designed to receive the ashes of the dead. The philosopher Maupertuis lies here, with the celebrated Lenotre, to whom the principal gardens in France are indebted for all their beauty. The two statues, Augier, likewise repose in this asylum. To each of these a simple monument is erected; while the stranger is unable to repress his astonishment that not the slightest inscription records the talents of Corneille, who slumbers by the side of the painter Mignard. The steps and pillars of the portal bear the frightful impression of numerous musket and cannon balls, which were directed against the citizens of Paris on the fatal 13th of Vendémiaire.

St. PHILIPPE du ROULE, Parish of St. Madeleine.—This church will please from its simplicity, and its resemblance to the edifices of the ancient Christians. The portal is composed of four columns of the Doric order, surmounted by a triangular pediment. At the extremity of the peristyles are two chapels, dedicated to the Virgin and St. Philip, which were designed to support two towers. The arches of the roof are of wood, but painted in such close imitation of stone, that they cannot possibly be distinguished from it.

St. NICOLAS du CHARDONNET, Rue St. Victor.—This otherwise-pleasing church presents a strangely-unfinished appearance, from the want of a portal. It was richly decorated with the paintings of Lebrun, whose tomb constitutes its principal ornament.

St. JACQUES du HAUT PAS, Rue St. Jacques.—This church was built on the ruins of an ancient chapel, by Anne of Bourbon, duchess of Longueville, in 1684. Her heart was interred here. The ashes of the celebrated Cassini, and of the virtuous Cochin, the curé of this parish, who sold all his property, and even his library, to found an hospital for his indigent parishioners, repose here.

St. GENEVIEVE, Rue St. Jacques.—The church of St. Geneviève was begun in the year 1764. It is in the form of a cross, 340 feet long, and 250 broad. The portal, in imitation of that of the Pantheon at Rome, consists of a noble peristyle of twenty-two Corinthian columns. Each column is five feet and a half in diameter, and fifty-eight in height. The flowers of the chapiters are highly finished. These columns form a spacious porch, 112 feet in length, and 36 deep, crowned with a grand bas-relief, sculptured by Coustou. It is ornamented by four colossal statues, producing an imposing and grand effect. The front of the building within the porch unites the masculine air of the Gothic with the beauty of the Grecian architecture. The interior consists of four naves, decorated with 130 Corinthian columns, supporting an entablature, which serves as a basement to the galleries, skirted with stone balustrades. Above rises a lofty dome, resembling a circular temple, formed of fifty-two pillars, each fifty-four feet high, supported by a circular basement which rises above an octangular sub-basement. This dome is surmounted by another smaller; which, not being terminated by any figure or ornament, has a rather unpleasing appearance.

J. P. H. & Co.

Church of St. Philippe du Roule.

Engraved for the Encyclopædia Londinensis.

appearance. The whole is surmounted by a terrace, protected by an iron balustrade. The total height of the building is 282 feet.

The bold and light style of the architecture, in which it was originally built, had nearly hazarded the destruction of the whole edifice. The pillars which supported the dome began to bend under its enormous weight; and it was only by sacrificing somewhat of its beauty, and introducing confusion into the style of the whole, that Rondelet was enabled to preserve it from ruin. He placed twelve new columns under the dome; and by the brightness of the gilding, and the beauty of the painting, very skilfully endeavoured to conceal the injury he was doing to the coup-d'œil of the edifice. The connoisseur will, however, perceive a disagreeable contrast between the original lightness of the naves and the massiveness of the centre of the building.

At the beginning of the Revolution, this magnificent building changed its name to The PANTHEON. A pedestal was fixed on the dome, which was intended to receive a colossal statue of Fame, twenty-eight feet high; and the interior was destined to receive the ashes of those who had deserved well of their country. The inscription in front was simple and sublime:

AUX GRANDS HOMMES, LA PATRIE RECONNAISSANTE.

Dedicated by a grateful Country to its illustrious Men.

The vaults are skilfully contrived; and are neither dark, damp, nor gloomy. They consist of galleries lined with cells. In these cells, all nearly of the same size, the bodies are deposited, each in a stone sarcophagus of exactly the same size and form. An inscription relates merely the name, the dignity, and age, of the deceased. Over the door of each cell is the cipher XP and the letters A and Ω.

We understand that the church of St. Genevieve has since recovered its original name, and is now in the course of being restored to its primitive use: the inscriptions, bas-reliefs, &c. are to be taken down; and it is said the bodies of Voltaire, Rousseau, &c. will not be permitted to remain.

The PROTESTANTS have four churches in Paris; and the JEWS have six synagogues.

RELIGIOUS COMMUNITIES.—There are eighteen religious communities or societies of females at Paris, whose principal employment is attending the sick at the hospitals, and the poor at their habitations, and in gratuitously instructing young females.

The convent of the Benedictines is in Rue du Regard; and that of the English Benedictines in Rue des Fossés St. Victor.

The Carmelites have three houses: Rue Maillet; Rue d'Enfer; and Rue de Vaugirard. The painted dome of the chapel of the last of these has been much admired. It represents the Transfiguration of the Prophet Elijah, by Bertholet Flamel. In this convent the cannibals of the 2d and 3d of September commenced their horrible massacres.

The Nuns of our Lady of Charity are in Rue St. Jacques. Their convent forms a species of female penitentiary, and is appropriated for the reception of those whom parental wisdom or caprice consigns to a temporary or lasting confinement and punishment.

The Dominicans are in Rue d'Angoulême and Rue Moreau. Their principal employment is the education of young ladies.

The interesting society of the Sisters of Charity, whose lives are devoted to assuage the pains and heal the diseases of the most miserable of their fellow-creatures, have their principal convent in Rue du Vieux Colombier.

MUSEUM OF FRENCH MONUMENTS, Rue des Petits Augustins.—During the phrenzy of the revolution, many churches were reduced to ruins; most of the monuments they contained were mutilated, and many of them destroyed. The tombs at St. Denis, in particular, were

torn up by the unhallowed hands of ignorant barbarian despoilers. When the body of Henry the Fourth was discovered, it was found in such a state of preservation, that the features of his face were not altered. It was a dry mummy; the skull had been sawed, and in the place of the brain, which had been taken out, contained some tow, steeped in an aromatic liquor, which sent forth a strong odour. A soldier, who was present, moved by a martial enthusiasm, at the instant of opening the coffin, threw himself on the body, and after a long silence of admiration, drew his sword, cut off a long lock from the beard, which was still fresh, and exclaimed at the same time, in a very energetic manner, "And I too am a French soldier! henceforth I will have no other mustachios." As he placed it on his upper lip, "Now," said he, "I am sure to conquer the enemies of France; I march to victory!" This flourish in favour of a beloved king was not, however, much relished by the *enfants de la patrie*, the excellent republicans, there assembled: the body was therefore presently set upright upon a stone, for the rabble to divert themselves with it; and a woman, reproaching the dead Henry with the crime of having been a king, knocked him down by a blow in the face; after which the corpse was left for some days to be the sport of these Yahoos, till it was thrown at last into the common pit prepared for the remains upon which their senseless vengeance had been exercised.

Louis XIV. was found in a state of perfect preservation, but entirely black. The body of Louis XV. was fresh, but red, lying bathed in a liquor formed by the dissolution of the salt with which it had been covered. In the coffin of Jeanne de Bourbon, wife of Charles V. a gilt distaff was found with the remains of a crown, bracelets, and embroidered shoes. The body of Louis VIII. was the only one which had been sewed up in leather: the leather was strong and thick, and retained all its elasticity; the body was almost consumed, as was the winding-sheet, but fragments of its gold embroidery were still existing. Dagobert and his queen Nanthildes were in one coffin with a partition between them. The workmen were long before they could discover the vault of Francis I. and his family: it contained six leaden coffins deposited upon bars of iron: in all these the remains were in a state of liquid putrefaction, which made its way through the lead as they were removed, and the odour was almost insupportable. The bodies of many of the latter Bourbons were also in a state of decomposition; and, when the coffins were opened, they are said to have emitted a thick black vapour, which, though vinegar and gunpowder were burnt to prevent ill consequences, affected the wretches employed in this inhuman work with fevers and diarrhoeas. Two large pits had been dug in front of the north entrance of the church, and quick-lime laid in them; into these pits the bodies were cast promiscuously, and the entrails, which had been deposited separately in leaden vessels; this lead and the leaden coffins were then carried to a furnace which had been erected in the cemetery, and cast into balls "destined to punish the enemies of the Republic;" and it was more than once proposed in the National Convention that the church itself should be totally destroyed!

The Convent of the Augustins, the Westminster Abbey of France, is the sanctuary in which were deposited those curious relics of ancient art which accidentally escaped, or were by artifice rescued, from the fatal effects of indiscriminate political fury; and it is to M. le Noir that we owe the collection, preservation, and admirable arrangement, of these interesting monuments of sculpture, brought together from all the churches and cathedrals of France. He has published an historical and chronological description of them, with a curious dissertation on the costume of each century.

The building which contains these monuments resembles a cathedral-cloister. It is encompassed by four walls; and has a garden, the funereal decorations of which are appropriate to the situation.

The monuments are distributed in different apartments; and, by their arrangement, exhibit the state of statuary in France from the earliest periods to the present time. They are arranged according to their respective antiquity, each containing specimens of a single century, which is numbered at the entrance; and receiving light through windows of painted glass, executed during the same period.

The eye of a stranger is first arrested by the mouldering altars of the ancient Gauls,—altars probably stained with human blood. Passing over many of the rude vestiges of early times, he dwells with enthusiasm on the tomb of Clovis: he beholds that prince humbling himself, and supplicating pardon for the atrocities which he had committed. He pauses on the remains of the cruel Chilperic; his attention is rivetted on the monument of the murderers Fredegonde, till he is roused by the martial air and menacing attitude of the illustrious Charlemagne, who, with brandished sword, appears to be dictating laws to the world. On these relics of remote ages time has committed many ravages; but, with all their mutilations, they are interesting to the historian and the artist.

An anachronism, not pleasing to the eye of taste, is admitted here, on account of its supposed effect. The beautiful mausoleums of Francis I. and Diana of Poitiers, equally versed in the mysteries of politics and love, form a striking contrast with the rude efforts of earlier ages. The statue of Corneille likewise occupies a place in this hall, with many other exquisite pieces of sculpture.

The apartment dedicated to the thirteenth century contains not much worthy of attention. We observe the tombs of Louis IX. his son Philip, his wife Isabella of Arragon, and his brothers Charles; but the art of sculpture has made little progress.

With the apartment containing the relics of the fourteenth century are found the effigies of Philip the Fair, and of John. The middle of the hall is enriched by the statue of Charles V. furnished the Wise, the noble Du Guesclin, and his friend Sancerre.

In the hall of the fifteenth century we perceive the dawn of that light and elegant architecture which distinguishes modern times. The monuments, which are there preserved, interest by their number, and by the names with which they are connected. The connoisseur first pauses at the tombs of Louis d'Orleans, and his brother Charles the Poet. After which appear Renée d'Orleans, grandson of the intrepid Dunois, and Philip de Comines, the father of modern history. The statue of Louis XI. is placed near that of his son Charles VII. and, not far distant, the heroic and unfortunate Joan of Arc stands by the side of Isabel of Bavaria. In the centre of this group the superb tomb of Louis XII. in the form of a Gothic chapel, is one of the noblest specimens of the improved taste of the 15th century. His recumbent figure, characteristic of death, reminds the spectator of that melancholy hour, when thousands of his weeping subjects, following his remains to St. Denis, exclaimed, "Our good monarch Louis XII. is dead. In him we have lost our father and our friend."

The Hall of the Sixteenth Century contains the statues of Francis I. and Claude his queen, the good Henry, the brave Coligny, the witty but immoral Rabelais, the sage l'Hôpital, the unprincipled Catharine of Medicis, and many others. Some painted glass, respecting the history of Pityche, although beautifully executed, does not quite accord with the solemnity of the place.

Entering the hall appropriated to the seventeenth century, the stranger is bewildered amid the crowd of philosophers and heroes which present themselves to his view. He contemplates the form of Richelieu resting in the arms of Wisdom, Turenne reposing in those of Immortality, and Mazarine suppliant at the throne of Heaven. The names of Corneille, Molière, La Fontaine, Racine, Fenelon, Pascal, and Boileau, fill him with pleasing veneration. In the centre of the hall is placed the exquisitely-finished statue of Louis XIV. rendered still more sublime

by the immortal geniuses which surround him. The tombs of Le Brun, the French Apelles; Poussin, the painter of philosophers and poets; Colbert, the profound financier; Descartes, the antagonist of Newton; De Thou, the philosophical historian; Bossuet, the eloquent preacher; Coysevox, the inimitable statuary; and Le Nôtre, to whom the most beautiful gardens of France owe all their elegance, will not be overlooked.

The eighteenth century presents us with the illustrious names of Voltaire, Crebillon, Montesquieu, Rousseau, Maupertuis, Coustou, Lepautre, Saxe, Helvetius, Fontenelle, Buffon, and d'Alembert. The remarkable difference in the design and execution of the monuments of Maupertuis, Caylus, and the Marechal d'Harcourt, and those which decorate the extremity of the hall, shows the rapid progress of the art during the last century.

The garden is converted into a kind of Elysium, where, shaded by the cypress and the willow, repose the ashes of Molière, La Fontaine, Boileau, Descartes, Maffillon, and Montfaucon; the warrior Du Guesclin, and the monarch Dagobert. In a small sepulchral edifice, constructed with materials from the very mausoleum which enshrined them, were deposited the bones of Abelard and Eloisa; but they have been removed to the cemetery of Père la Chaise.

CATACOMBS AND CEMETERIES.—The cemeteries of Paris were originally without the walls of the city; but, as its boundaries were gradually extended, they became surrounded by buildings. Of these the cemetery belonging to the church of the Holy Innocents was the most capacious as well as most distinguished: for more than seven centuries it served as a receptacle for the dead for upwards of twenty parishes. Philip Augustus, as far back as 1186, inclosed it with high walls, and the gates were closed at night. About forty years afterwards the bishop of Paris, Pierre de Nemours, enlarged it; but from that time no further enlargement of its precincts was ever made. In 1440, Denis Desmoulins, then bishop of Paris, raised the burial-fee; at which the people murmured, and resented the imposition, as they deemed it, so strongly, that they entered into a combination, and during four months no person was buried there, and no funeral service performed over those who died, a revenge for which the bishop excommunicated them all. This quarrel did not continue long; and, as generations after generations were piled one upon another within the same ground, the inhabitants of the neighbouring parishes began to complain of the great inconvenience and danger to which they were exposed; diseases were reasonably imputed to such a mass of collected putridity, tainting the air by exhalations, and the waters by filtration; and measures for clearing out the cemetery would have been taken in the middle of the sixteenth century, if some disputes between the bishop and the parliament had not prevented them. To save the credit of the burial-ground, a marvellous power of consuming bodies in the short space of nine days was imputed to it, as Hentzner tells us when he describes the place as *sepulchrorum numero et scelestis admirandum*.

The mode of interment was of the most indecent kind, not in single graves, but in common pits. "I am astonished," says Philip Thicknesse writing from Paris, "that, where such an infinite number of people live in so small a compass, they should suffer the dead to be buried in the manner they do, or within the city. There are several burial-pits in Paris, of a prodigious size and depth, in which the dead bodies are laid side by side, without any earth being put over them till the ground-tier is full; then, and not till then, a small layer of earth covers them, and another layer of dead comes on, till, by layer upon layer, and dead upon dead, the hole is filled with a mass of human corruption, enough to breed a plague. These places are inclosed, it is true, within high walls; but, nevertheless, the air cannot be improved by it. The burials in churches too often prove fatal to the priests and people who attend; but every body and every thing in Paris is so much alive, that not a soul thinks about the dead."

dead." Mr. Thicknesse was mistaken in one point; there was no intermediate earth between the layers of the coffins: they were closely packed, one tier above another, in pits thirty feet deep and twenty square, and, when the pit was full, it was covered with a layer of soil, not more than a foot in thickness. These *fosses communes* were emptied once in thirty or forty years, and the bones deposited in what was called *Le Grand Charnier des Innocens*, an arched gallery, which surrounded the burial-place, having been erected at different times, as a work of piety, by different citizens, whose names, and sometimes their escutcheons, were placed upon the parts which they had founded. One of these pits, which was intended to contain two thousand bodies, having been opened in 1779, the inhabitants of the adjoining streets presented a memorial to the lieutenant-general of the police; they stated that the soil of the burial-ground was raised more than eight feet above the level of the streets and the ground-floor of the adjacent houses, and represented that serious consequences had been experienced in the cellars of some of the houses. The evil indeed was now become so great, that it could not longer be borne. The last grave-digger, François Pontraci, had, by his own register, in less than thirty years deposited more than 90,000 bodies in that cemetery: for many years the average number of interments there had been not less than 3000; and of these from 150 to 200 at the utmost were all that had separate graves: the rest were laid in the common trenches, which were usually made to hold from 12 to 1500! It was calculated that since the time of Philip Augustus 1,200,000 bodies had been interred there; and it had been in use as a cemetery many ages before his time.

A memorial upon the ill effects which had arisen, and the worse consequences which might be expected to arise, from the constant accumulation of putrefaction, was read before the Royal Academy of Sciences, in 1783, by M. Cadet de Vaux, who held the useful office of Inspecteur Général des Objets de Salubrité. The Council of State in 1785 decreed, that the cemetery should be cleared of its dead, and converted into a market-place, after the canonical forms which were requisite in such cases should have been observed: the archbishop, in conformity, issued a decree for the suppression, demolition, and evacuation, of the cemetery, directing that the bones and bodies should be removed to the new subterranean cemetery of the Plaine de Mont Rouge, and appointing one of his vicars-general to draw up the procès-verbal of the exhumation, removal, and re-interment; and the Royal Society of Medicine appointed a committee to explain the plans which should be presented for this extraordinary operation, and to superintend a work as interesting to men of science as it would have been shocking to common spectators.

It fortunately happened that there was no difficulty in finding a proper receptacle for the remains thus disinterred. "No great shock is wanting," says Prudhomme, "to throw down all the stones of Paris into the place from whence they were quarried. The towers and domes and steeples are so many signs which tell the beholder, that whatever he sees above his head has been taken from under his feet." The quarries had been worked from time immemorial without any system, every man working where he would and as he would, till it became dangerous to work them farther; and it was only known as a popular tradition that they extended under great part of the city, till the year 1774, when some alarming accidents roused the attention of the government. They were then properly surveyed, and plans of them taken; and the result was the frightful discovery, that the churches, palaces, and most of the southern parts of Paris, were undermined, and in imminent danger of sinking into the pit below them. A special commission was appointed to direct such works as might be required. The necessity of the undertaking was frightfully shown the very day that the commission was installed,—a house in the Rue d'Enfer having that day sunk down eight and twenty metres

below the level of its court-yard! Engineers were now employed to examine the whole of the quarries, and probe the streets, roads, churches, palaces, and buildings of all kinds, which were in danger of being engulfed! One set of workmen were employed in this curious service; another in exploring the labyrinth of excavations, some of which were under the others, and opening galleries between them, that the extent of the peril might be known; and, to prevent future evils of the same kind, all the quarries which were still in use in the environs of Paris were placed under the inspection of the commissioners, that they might be worked upon some safe system. Never had any men a more arduous or more important commission! The pillars which had been left by the quarriers in their blind operations, without any regularity, were in many places too weak for the enormous weight above, and in most places had themselves been undermined, or perhaps originally stood upon ground which had previously been hollowed. In some instances they had given way; in others the roof had dipt and threatened to fall; in others great masses had fallen in. The great aqueduct of Arcueil passed over this treacherous ground; it had already suffered some shocks, and, if the quarries had continued to be neglected, an accident must sooner or later have happened to this water-course, which would have cut off the supply from the fountains of Paris, and have filled the excavations with water.

Such was the state of the quarries when the commission was appointed in 1777, under M. Charles Axel Guillaumot as inspector general. The thought of converting them into a necropolis originated with M. Lenoir, lieutenant-general of the police; and the proposal for removing the dead from the Innocents was the more easily entertained, because a receptacle so convenient, and so unexceptionable in all respects, was ready to receive them. That part of the quarries under the Plaine de Mont-Souris was allotted for this purpose, a house known by the name of La Tombe Isoire, or Isouard, (from a famous robber, who once infested that neighbourhood,) on the old road to Orleans, was purchased, with a piece of ground adjoining; and the first operations were to make an entrance into the quarries by a flight of seventy-seven steps, (the depth being seventeen metres,) and to sink a well from the surface, down which the bones might be thrown. Meantime the workmen below walled off that part of the quarries which was designed for the great charnel house, opened a communication between the upper and lower vaults, and built pillars to prop the roof. When all these necessary preliminaries had been completed, the ceremony of blessing and consecrating the intended Catacombs was performed with great solemnity, on the 7th of April, 1786; and on that same day the removal from the great charnel-house began. This work was always performed at evening; the bones were brought in funeral cars, covered with a pall, with priests in their surplices following and singing the service of the dead.

The removal of the bones from the Holy Innocents was continued during the cooler months, while another set of workmen was preparing the quarries to receive them; and the business of exhumation was completed in January 1788. The utmost order prevailed in carrying on the different works, the arrangements of which frequently presented a truly picturesque appearance. The vast number of flambeaux and of rows of torches which were every where burning, and shed a dim funereal light around the surrounding objects; crosses, tombs, and epitaphs, intermingled; the silence of the night; the thick cloud of smoke that concealed the place where the labourers were at work, whose operations could not be distinguished, and who appeared to flit along like shadows; the various ruins caused by the pulling down of edifices; the subversion of the soil in consequence of the exhumations; all together formed a scene most impressively awful. The solemnity of the spectacle was augmented by religious ceremonies; by the conveyance of coffins;

by

by the splendour which accompanied the removal of the tombs of the most distinguished personages; by the funeral cars and cenotaphs; by the hearths filled with bones, and slowly proceeding at the close of day towards the new catacombs prepared for their reception; by the appearance of these vast excavations, and the solid arches which seemed to cut off the abode of the living from the dead; by the dismal light of the place; the frightful creaking of dry bones, which, as they were thrown in, rolled along with a terrific noise that was re-echoed through the long series of arches; every thing, in short, concurred to place before the eyes the image of death, and to inspire the most solemn recollections of man's universal doom and final catastrophe.

All the crosses, tombstones, and monuments, which were not reclaimed by the families of the dead to whom they belonged, were carefully removed, and placed in the field belonging to La Tombe Ifoire: some among them were very curious. Many leaden coffins were buried in this field: one of them contained the remains of Mad. de Pompadour, who, by her own desire, had been interred at the foot of what was called the cross of the Holy Innocents. Thus far things had been conducted with the greatest decorum; but, as the revolution proceeded, La Tombe Ifoire was sold as a national domain, the leaden coffins were melted, and all their monuments destroyed; those which could not be sold, or applied to any purpose of use, were demolished; a *salle de danse* was then opened on the spot.

Fortunately there was nothing in the Catacombs which could provoke the wretches whom the Revolution had let loose upon society; but they were so much neglected, that in many places the soil had fallen in, and choked the communications; water came in by filtration, the roof was cracked in many places, and threatened fresh downfalls; and the bones themselves lay in immense heaps, mingled with the rubbish, and blocking up the way. It was not till the year 1810 that M. de Thury was enabled to pursue his plans; and the workmen then had to make galleries through the bones themselves, which in some places lay above thirty yards thick. It was necessary also to provide for a circulation of air, the atmosphere not having been improved by the quantity of animal remains which had been introduced. The manner in which this was effected is singularly easy. The wells which supplied the houses above with water were sunk below the quarries, and formed in those excavations so many round towers. M. de Thury merely opened the masonry of these wells, and luted into the opening the upper half of a broken bottle, with the neck outwards: it is only necessary to uncork two, three, or more, of these bottles, when fresh air is wanted. Channels were made to carry off the water; steps constructed from the lower to the upper excavation; pillars built in good taste to support the dangerous parts of the roof, and the skulls and bones built up along the walls. In short, by a series of long-continued labours, they have so admirably disposed the solid works in these excavations, that each subterranean street corresponds with the street above, and the numbers of the houses under ground also correspond with those on the surface of the earth: hence, if the ground should sink in any part of Paris, a suitable remedy may instantly be applied. These excavations reach beneath the extensive plain of the Faubourg St. Germain, forming nearly the whole of the southern half of Paris, and under a small part of the department of the Seine in the northern division.

Three staircases form the channels of communication between the Catacombs and the surface of the earth; but that of the Barriere d'Orleans or *d'Enfer*, (Hell Gate,) is the staircase by which visitors generally descend into these dreary yet interesting caverns. A narrow staircase of eighty steps, winding down a circular well, leads to a gallery, or avenue, hewn out of the solid rock, and varying from three to four feet in width, and from six to seven in height. The stone is clean, white, and dry, and

thickly studded with shells, and various marine antediluvian remains. Numerous passages branch off on either side, some of which are said to extend more than three miles; but many of these avenues were prudently stopped when they became the resort of banditti.

The stranger is accompanied by a guide, who conducts him in safety through this immense labyrinth, and who is himself directed by a black line traced on the ceiling through the whole of the course which he is to pursue. The guides generally commence their task about twelve o'clock. Every stranger, on entering the Catacombs, will find it necessary to have a wax taper in his hand which may be purchased on the spot, and never to lose sight of the guide. After the traveller has proceeded a quarter of a mile, he should inquire for the Gallery of Port-Mahon. A soldier, who had accompanied marshal Richelieu in the expedition against Minorca, was, on his return, compelled by necessity to work in these quarries. During the hours of refreshment, he employed himself in modelling in relief a plan of Port-Mahon. The execution is, as might be expected, sufficiently rude; but the accuracy of the representation is acknowledged by every competent judge, and the whole is highly creditable to the ingenuity, the memory, and the patience, of the soldier, who, ignorant of architecture, completely without assistance, and almost without instruments, nearly accomplished the singular and arduous undertaking. It is painful to add, that he was crushed by a mass of rocks, and perished the victim of his ingenious enterprise.

At a little distance is another curiosity, which probably will not be shown unless the traveller inquires for it. Some enormous fragments of stone are so nicely balanced on a base, hardly exceeding a point, that they rock with every blast of wind, and threaten to overwhelm the curious observer; yet in this equilibrium they have hung for more than two centuries, and it would probably require a gigantic force to remove them from their position.

After proceeding more than half a mile, the stranger arrives at another low-roofed hall, in which is a black door, supported by two Tuscan pilasters, with this inscription: *Hæc ultra metas requiescunt, beatam spem expectantes*; "Beyond these bounds rest the dead, awaiting the joyful hope of immortality." This is the entrance to the Catacombs. On the lintel of the gate the following verse of Delille is cut in the rock: *Arrête! c'est ici l'Empire de la Mort*.

On entering the Catacombs, the mind is awfully impressed with the long galleries and numerous apartments, all furnished, or (if we may be allowed the expression) ornamented, with bones. The largest skulls and thigh-bones are symmetrically disposed in compartments, and form as it were the facing of these mournful walls, behind which are placed the smaller bones. "What frightful decorations!" (exclaims a recent traveller;) walls, arcades, and pillars, of bones, adorned, not with garlands of roses and myrtles, but with arabesques of arm and leg bones, and, instead of heads of genii and cornucopias, with ghastly skulls! Altars of death's heads in symmetrical order gradually growing smaller towards the top, and crowned with crossed bones: a *mosaic work*, which, by its regularity and harsh contrast of the white lime-wash with the dark brown colour of the bones, that never blanch in these humid vaults, heightens the gravity, the musing melancholy and awe, that penetrate the inmost recesses of the soul in these repositories of mortality." A few of these altars are of an antique form, and composed of the solid rock. They stood here before these caverns were appropriated to their present destination. One of them has certainly occupied its present situation from time immemorial, and has given rise to the not-improbable conjecture, that these secret and deep recesses were used as places of worship, either by the Gauls or by the early Christians, during the persecution which followed the first preaching of the Gospel in these parts.

These chapels contain numerous inscriptions; some of

of them simply indicating the cemetery whence each mouldering pile of bones was removed; others too strongly reminding the reader of the atheistical era of the Revolution; and a very few displaying considerable feeling and good taste. The following are the principal objects of attention.

1. The *Crypt of St. Laurence* is an ancient and very spacious excavation, the great depth of which recommended it as a repository of the bodies removed from the cemetery of St. Laurence, at the time of its suppression in November 1804, and when the street of the same name was opened. All the dry bones taken out of that cemetery have been collected and arranged so as to form a separate crypt, the entrance to which is supported by two columns of the Doric order of Pœstum. At its extremity is a pedestal constructed of bones, the mouldings of which are formed of tibiae, or leg-bones, of the largest size; and the dado or square trunk of the pedestal is surmounted with a head in a fine state of preservation.

2. The *Altar of the Obelisks*.—The northern part of the Catacombs having sunk down in several places, there was reason to apprehend a general falling-in of the superincumbent earth. To prevent this disaster, M. Guillaumot, the inspector-general in 1810, directed pillars, walls, and counter-walls, to be built wherever there was any appearance of danger. The high altar and obelisks which decorate this crypt are therefore nothing but works of consolidation concealed under the ornamental form of these monuments. The altar is copied from a magnificent ancient marble tomb, discovered a few years since between Vienne and Valence, on the banks of the Rhone; the obelisks are reductions of ancient obelisks; and the two pedestals on the right and left of the altar are constructed of bones in a similar manner to that in the crypt of St. Laurence. This chapel or crypt of the obelisks contains several appropriate inscriptions, chiefly taken from the Scriptures.

3. The *Sarcophagus of the Lachrymatory* is likewise one of the great works of consolidation to which a sepulchral form has been given: it is also known under the name of the *Tomb of Gilbert*.

4. The *Pedestal of the Sepulchral Lamp*.—The necessity of obtaining a more free circulation of air in the Catacombs induced the workmen to place a large vessel of fire on a block of stone; and the appearance of this suggested the idea of substituting a sepulchral lamp in its place. The lamp is in the form of an antique cup, and was the first monument erected in the Catacombs. Opposite to it is the *Pillar of the Memento*, a large and massive cruciform column, or triangular cross, which has received its name from the following sentence, extracted from the mass for Ash-Wednesday; *Memento, homo, quia pulvis es, et in pulverem reverteris*. And behind the latter column is the *Pillar of the Imitation*, so called because the four inscriptions that ornament it have been taken from the celebrated work of Thomas à Kempis *De Imitatione Jesu Christi*.

5. The *Fountain of the Samaritan Woman*.—This appellation has been given to a spring that was discovered in the soil of the Catacombs by the workmen, who established a reservoir here to collect the water for their use. As the waters gushed out of this basin into the works, it became necessary to take their level; and advantage was taken of the difference of levels to construct over this spring a staircase, a basin, and a subterraneous aqueduct; and, the roof or top being intersected in different directions by fissures and cracks, the workmen were obliged to erect pillars and contreforts, the monumental forms of which have greatly contributed to the embellishment of this fountain.

On the 25th of November, 1813, four gold fish were thrown into the basin of this fountain, where they have become perfectly domesticated. They answer to the signs and calls of the keeper, and appear to have grown in this unnatural situation, but they have not spawned. Three

VOL. XVIII. No. 1258.

of them have retained their brilliant colours, but some spots have appeared on the fourth; and it seems probable that exclusion from light may produce, though more slowly, the same effect upon them that it does upon vegetables.

6. *Tombs of the Revolution*.—This appellation has been given to the spacious crypt which contains the tombs of those who were the earliest victims of the French Revolution. The place of interment, and the period when the remains of these unhappy persons were committed to the Catacombs, are respectively marked by the following inscriptions. I. Combats de la Place de Grève, de l'Hotel de Brienne, et de la rue Meslée chez le commandant du Guet, le 28 et 29 Aout, 1788. II. Combat de la Manufacture de Papiers peints (Paper-hanging Manufactory) de M. Reveillon, Faubourg St. Antoine, le 28 Avril, 1789. III. Combat du Chateau des Tuileries, le 10 Aout, 1792.

7. The *Tombs of the Victims of the Massacres on the 2d and 3d of September, 1792*.—Under the direction of M. Guillaumot, Inspector General of Quarries, M. Laplace, keeper of the Tomb of Ifoire, protected by the silence of the night, caused the remains of those who had perished on these different days to be interred in the Catacombs, with as much decency as circumstances would permit. Their bones are concealed from view behind a wall painted black, which for a long time presented only the following brief notice: D.M. II. ET III. SEPTEMBR. MDCCXCII. During those days of terror, no expiatory altar could be raised; but two marble tablets now commemorate the names of the most illustrious of these victims.

We shall copy but one more inscription. It is very curious, but certainly very revolting: *Ici sont inhumés LXXXVII mètres cubes d'ossements, recueillis dans le cimetrie des Innocens, du 19 Janvier au 19 Mars, 1811.* "Here are deposited 90 cubic yards of bones, collected from the cemetery of the Innocents, between the 19th January and the 19th March, 1811."

The calculations of different visitors and authors vary as to the number of bones collected in this vast charnel-house. It is certain that there are more than three millions of human skulls; some writers have asserted that the Catacombs contain six millions.

A faint mouldering smell pervades these gloomy caverns, but not to any unpleasant or deleterious degree.

Before he quits the Catacombs, two Museums are shown to the stranger. The first is a collection of all the fossil remains, mineral productions, spars, &c. which these quarries afford: some of the specimens are curious and beautiful. The other, which is principally interesting to the medical traveller, are specimens of the various diseases of the bones, selected from this immense repository, and scientifically arranged.

Having quitted the Catacombs by a portal bearing this beautiful and appropriate quotation,

*Felix qui potuit rerum cognoscere causas,
Atque metus omnes, et irrevocabile fatum
Subjecit pedibus, strepitumque Acherontis avari!*

the traveller again follows a black line traced on the roof, which conducts him to another staircase; ascending this, he finds himself on the east of the road to Orleans, which he had crossed under ground, and more than half a mile from the place at which he descended.

CEMETERIES.—In the year 1790, the National Assembly passed a fresh law prohibiting interment within the churches, and commanding all towns and villages to disuse their old burial-places and form new ones at a certain distance from the dwellings. During the revolution which soon ensued, when it was proclaimed that there is no God, and that death is eternal sleep, men were buried any where and any how, without any ceremony or memorial to mark the spot where they lay. But in the spring of 1800, an *arrêté* was published by the prefect of the department of the Seine, which is curiously characteristic in all respects. The prefect begins by announcing,

6 F

that

that *Les institutions funéraires sont un des premiers besoins de la civilisation*. Those, he said, which had fallen into disuse in consequence of the revolution, surrounded the funerals of the rich with splendour, and accorded nothing to the poor but the melancholy emblems of misery and desertion. Those which were in use treated rich and poor with the same neglect; and public opinion, in consonance with morality, condemned the nakedness of the actual mode of burial. It was worthy of the first city of the republic, to command by its example the decency of interment; and, above all, to consecrate the care of the burial of the poor as a duty of public piety. Three public cemeteries were to be inclosed for the use of Paris, of a certain extent, and at a distance of one mile from the walls. In the centre of each a *Lutuaire, ou Salle de Deuil*, was to be erected, destined to receive the funeral procession, and consecrated to the ceremony which might precede the act of interment. Six funeral temples were to be built in Paris, to serve as depots before the funeral. A mode of burial common to all was to be established. The commune of Paris was to defray the expense of the poor; but in all other cases it was to be reimbursed for the expenses, and consequently was empowered to levy a burial-tax. Families might incur any additional expense that they pleased; *il sera permis de consacrer des souvenirs dans les enclos de la sépulture publique, par des inscriptions, des énéotaphes, et autres monumens frivoles*; of course, in such cases, a price was to be paid for the ground. The costume of all the persons attached to this department was regulated with as much precision as that of the Directory themselves.

In 1804 an imperial decree was issued repeating the prohibition of interment in churches, or within the circuit of a town. High ground by this decree was to be chosen for cemeteries, and exposed to the north, and every corpse was to be interred in a separate grave, from a metre and a half to two metres deep, and the earth well trodden down. There was to be a certain distance between the graves, and they might not be re-opened till after five years. Another imperial decree in 1811 conigned the whole funeral business of the metropolis to one undertaker-general, arranged funerals into six classes, and appointed a *tarif* whereby the expense of every separate article and assistant was determined; the sum total in either class might not be exceeded; but might be diminished if the family of the deceased chose to strike out any thing in the list. The whole expenses of the first class amount to 4282 francs; of the second to 1800; of the third to 700; the fourth to 250, the fifth to 100, and of the sixth and last only to 16. The *tarif* will be considered hereafter as singularly precious, if posterity should be as curious concerning the costume of the present age as we are concerning the manners and customs of our ancestors.

The cemeteries, then, are without the walls; and the chief of them are those of Monceaux, Montmartre, Poincourt, St. Catherine, and Mont Louis. The most remarkable of these is the last, which is generally called the Cemetery of Pere la Chaise. This cemetery lies to the east of Paris, in front of the barrier d'Aunay, and on the north side of the boulevard of that name, near the road to Montreuil. Louis XIV. built a handsome house on this spot for his confessor, la Chaise, a Jesuit, who for the long term of thirty-four years had the keeping of this monarch's conscience. He was a persecutor of the Protestants, and advised the revocation of the edict of Nantes.

This cemetery is about fourscore acres in extent. It resembles not the burying-grounds of England and other countries, which are literally fields of the dead, and have nothing to distinguish them from other fields but a great number of square smooth white stones standing upright upon them; for it has in reality a most beautiful and interesting appearance. Over the ground, which is very much broken and hilly, are scattered various kinds of

fruit-trees,—the remains of the garden and orchard belonging to the house of father la Chaise. The principal entrance, where funerals are admitted, is through a handsome gate, opening to a broad road, planted on each side with a double row of linden-trees, at the end of which is a wood, with another avenue of lindens through it; under their foliage is appropriately placed the tomb of Delille, the poet of gardens.

From the west platform, near the southern wall, the *coup d'œil* is strikingly grand; for, the eye of the spectator being on a level with the heights of Montmartre and Clichy, Paris, and the vast extent of country beyond it, are brought into the view. Beneath your feet are tombs of various kinds, most of them of elegant forms, each encircled with funereal or other trees, according to fancy; and all, even those which are in a ruinous or neglected state, having sweet-scented flowers and shrubs growing on or near them. Many have roses, myrtles, jasmines, geraniums, and mignonette, planted round them. The truly classical idea of hanging garlands of flowers on the tombs of friends and relatives is here most completely realised; many of these tombs have the appearance of being recently thus adorned. The choicest and most scarce flowers are generally selected to form these garlands: tuberoses, and other green-house plants, are common in them.

The grandest monument on the ground is the sepulchre of the family of Greffuhl; it is a chapel of Gothic architecture, situate on the north side, and near a beautiful range of sycamores. Towards the east is a small platform, formerly called The Belvidere; it is a shady square formed by eight linden-trees; in the midst of the tombs occupying the space is a fine monument to Mestrezat, the Genevan pastor; and the Protestants have selected the ground about here for their burial place.

The poet Chenier's tomb has this simple inscription: "Marie Joseph Chenier, né à Constantinople en 1764, mort à Paris en 1811." Near that lies Fourcroy, with his bust in a niche, under which is simply inscribed his name. Not far from the latter are the tombs of Labe-doyere and Ney, famous for their bravery and their unfortunate fate. Here likewise repose the ashes of Madame Cottin and Mademoiselle Clairon, together with many others, whose names will live when their monuments, like their mortal remains, are mouldered away.

The monument of Abelard and Eloise, which was transported from the Abbey of Paraclete, and placed in the internal court of the Petits Augustins, has now been removed hither. This tomb actually contains the ashes of the two lovers. See the article ABELARD, vol. i. p. 14. 6th edit.

St. Foix, in his *Essais Historiques sur Paris*, says, that Charles IX. had formed the design of converting the Bois-de-Boulogne into a burying-place for heroes. The idea was that of a great man; but that unfortunate monarch, like many others, followed bad counsels, and turned his abilities to a wrong purpose. The cemetery of Pere la Chaise, on a small scale, and of recent date, shows what that idea would have produced had it been put in execution.

Madame Raucourt, the celebrated actress, Lenoir, Dufresne, and Volney, the deistical writer, were buried here.

Though it is but thirteen years that this has been a cemetery, it is now the favourite and most fashionable one in Paris; for in Paris every thing has its fashion, and the Parisians have displayed great taste in the arrangement and construction of the tombs, and great affection and feeling in the epitaphs that are engraven upon them.

Cimetière Montmartre, or Field of Repose.—This is also to the north of Paris, and was the first opened after the new regulations in 1773. There are in this cemetery a number of tombs, with inscriptions that depict in elegant language the grief of the relatives left behind; but there are none erected to any person of great note.

There

There are two other cemeteries, that of *Vaugirard* and of *St. Catharine*; but in extent, situation, and other circumstances, they are less interesting than that of *Père la Chaise*. General Pichegru was interred in the cemetery of *St. Catharine*, where there is a plain tomb erected to him by the affectionate piety of his daughter. In *Vaugirard*, is interred Jean François de la Harpe. Here also are the monuments of Leroy and Lavalette.

Lastly the cemetery called *La Morgue*, situated on the Quai du Marché Neuf, is destined to receive the dead bodies of such individuals as have fallen victims to accidents and murders, or been induced by despair to put an end to their own lives; here they are publicly exposed, that they may be recognised by their relatives or friends.

On Sundays, in fine weather, the cemeteries are much frequented; and on the second of November, the day of *la Fête des Morts*, there is a sort of melancholy and sentimental pilgrimage, which is of the most impressive description.

It appears that the bills of mortality at Paris hold out a tremendous lesson of morals to the Parisians, if, as may be fairly inferred, they agree in their results with the tombstones of the different cemeteries. In the burial-ground of Montmartre, which is the deposit for the gay part of Paris, the purlieus of the Palais Royal, the Rues *St. Honoré*, *Vivienne*, *Richelieu*, and Montmartre, the Boulevards, and the *Chaussée d'Antin*, nine tombs in ten are to the memory of persons cut off in the flower of their youth: but in the burial-ground of *Père la Chaise*, which serves principally for the sober citizens of Paris, the inhabitants of the *Marais*, and of the *Faubourg St. Antoine*, nine out of ten record persons who had attained a good old age. In both cases this fact relates to subjects in easy or affluent circumstances; and the difference of mortality is solely attributable to the difference between a dissipated and a regular life. If nosological tables had been kept in different places, and in different parts of the world, with the same care as meteorological ones, how many more important results might have been deduced from them!

CHARITABLE INSTITUTIONS.

The hospitals and other charitable institutions of Paris are supported and maintained by government. Their number is scarcely credible. More than 15,000 beds are made up at the different hospitals, and the annual expenditure is computed at 300,000*l.* sterling. These charities may be considered as forming two distinct classes: the one comprehends the hospitals for the sick, called *Hopitaux*; the other, those for the indigent, *Hospices*. The former are devoted to the relief of the afflicted; the latter serve as an asylum to children, to the infirm, and to the aged poor. All persons who are not ill enough to be admitted of necessity into the hospital nearest to their residence, are obliged to present themselves at the *Bureau Central d'Admissions*, or General Office of Relief, where they are examined, and, if there be occasion, they receive a ticket of admission for the hospital where their particular disorder is treated.

HOTEL DIEU.—Formerly this was rather a charnel-house than an hospital. It was founded, as far back as the year 660, for the reception of the sick and maimed of both sexes, without any distinction of persons. All of every country, and of every religion, were admitted without form or recommendation. Though it contained but 1200 beds, the number of patients very often exceeded 5000, and on the average it was never less than 2500. Until the year 1786, no steps were taken for enlarging the hospital, or providing elsewhere for those who could not be conveniently accommodated in it. The air of the neighbourhood was contaminated by the noisome exhalations continually arising from this abode of pestilence; and that which was breathed within the walls of the hospital was so contagious, as to turn a trifling complaint into a dangerous disorder, and a simple wound into a mortification. In 1785 the attention of the government being

called to this serious evil by various memoirs, the academy of Sciences was directed to investigate the truth of the bold assertions made in different publications. A report was made, and the hospital enlarged so as to contain 2000 beds.

Since the revolution, the improvements introduced into the interior government of the *Hotel Dieu* have been great and rapid. Each patient now has a bed to himself. Those attacked by contagious disorders are transferred to the *Hospice St. Louis*. Infane persons are no longer admitted; men thus afflicted, are sent to a special hospital established at Charenton, and the women to *Salpêtrière*. Sick children of both sexes are no longer admitted promiscuously into different hospitals; but are received into a special hospital, extremely well arranged, and in a fine airy situation beyond the *Barrière des-Sevres*. At the *Hotel Dieu* every method has been put in practice to promote the circulation of air, and expel the noxious miasmata. In all the French hospitals, one ward, at least, is now always kept empty. The moment it becomes so by the removal of the patients into another, the walls are lime-whitened, and the air is purified by the fumigation according to the plan first proposed by Guyton Morveau. This operation is thus alternately performed in each ward in succession; that which has been the longest occupied being purified the first, and left empty till it is wanted.

Besides those mentioned above, the following may be considered as branches of or annexes to the *Hotel Dieu*.

Hopital Cochin, *Faubourg St. Jacques*.—This hospital was founded by the venerable *Cochin*, curé of the parish in 1782, who saw with regret his indigent parishioners exposed to the danger which the *Hotel Dieu* then presented. To provide them with a safer and more comfortable asylum, he disposed of all his property, and even his books. The hospital contains 130 beds.

Hopital Beaujon, *Faubourg du Roule*.—Founded in 1784 by the individual whose name it bears, with a revenue of 20,000 francs. It is a substantial building, and in good taste; the architecture has been as much admired as the humane purpose to which it is devoted. It is established on the same principle as the *Hotel Dieu*; and contains 120 beds.

HOTEL des INVALIDES, Hospital for wounded and superannuated Soldiers.—This *Chelsea Hospital of France* has generally been ranked among the most magnificent edifices of Paris. The building was projected by Henry III. commenced by Henry IV. and completed by Louis XIV. They whose blood had flowed for the safety and honour of their country, deserved a peaceable and comfortable asylum in their old age. The edifice happily unites the bold and masculine character that suited the purpose to which it was devoted, with the magnificence of the sovereign who erected it. It is composed of five courts, of equal form and dimensions, surrounded by buildings. A vast esplanade, bordered by rows of trees, and the centre decorated by a fountain, gives to the principal façade towards the *Seine* a noble perspective. A superb railing encloses the court before the hotel. The front consists of three floors above the basement, which is pierced with arcades. An advanced building presents itself in the centre, and at each extremity. That in the centre, and in which is the principal entrance, is decorated by Ionic pillars supporting a magnificent arch, in which was a bas-relief containing an equestrian statue of Louis XIV. accompanied by Justice and Prudence, the workmanship of the younger Coustou. These two figures yet remain. On each side of the gate are other figures representing the nations conquered by Louis XIV. with colossal statues of Mars and Minerva.

A spacious dome adorns the church, surrounded by forty columns of the Composite order, covered with lead, and ornamented with gilding. Above is a cupola with pillars, supporting a pyramid surmounted with a cross, which is 308 feet from the ground. From this lofty situation is an extensive view of Paris and its environs.

The church

church is regarded as the chef d'œuvre of French architecture, although it has been justly remarked that the portal is too small and too much divided to suit the lofty building to which it conducts. The interior of the dome was painted by Charles La Fosse, and represents the Apotheosis of St. Louis. Beneath it are the Twelve Apostles, by Jouvenet. From the dome were suspended the colours taken from different nations. They exceeded three thousand. It was a sublime idea to make the asylum of these veterans the depository of the choicest spoils of war. As they walked beneath the waving banners, perhaps the trophies of their own valour, every glorious exploit, in which they had borne a share, was recalled warm to their memory. They forgot their wounds, they forgot their age; again they fought the battles of their country; again they exulted in the shout of victory. When the allies were about to enter Paris in 1814, the French invalids tore down the banners, and made a bonfire of them, that it might never be said they were retaken. The sword of the great Frederic was likewise deposited here: it was claimed by Blücher on the entrance of the allies into the capital, and restored to Berlin, whence it had been taken by Bonaparte. The outside of the dome, which is seen at a great distance, was completely gilt by order of Bonaparte, and has on a fine day a most splendid effect; from the top is a grand view of Paris. The floor is extremely beautiful, entirely formed of tessellated marble, and exquisitely finished.

In the vaults of the church are deposited the remains of the great Turenne; a name which ever recalls to the mind of the Frenchman and the soldier the ideas of invincible courage and unfulfilled honour. On each side of the monument are figures representing Wisdom and Valour deploring the loss of the hero. In front is a bas-relief of the battle of Turckheim. The marshal is expiring in the arms of Victory. The simple name of TURENNE is the only and the sublime inscription which the mausoleum bears. Not far from him reposes Marshal Vauban.

Other objects of curiosity in this building are, the infirmary, attended by eighteen sœurs de la charité, the bakehouse, kitchen, and refectory, (the former particularly worthy of notice;) the wells, the clock, the library, given by Bonaparte for the use of the officers, containing more than 20,000 volumes; the council-chamber; and, before the last capture of Paris by the allies, a grand gallery filled with plans in relief, most beautifully executed, of the principal fortresses and strong towns in the French empire; but most of these became the prey of the Prussians, Austrians, &c.

The hospital is governed by a lieutenant-general, who has 7000 brave men under his care; and the revenues are under the inspection of a vigilant and regular administration. The sick are attended by able physicians, assisted by the sisters of St. Vincent de Paul. Here these old warriors find an asylum and a plentiful table; besides being treated in proportion to the rank they held in the army, or as their infirmities and the nature of their wounds may require. Nothing is spared that can ameliorate their affliction, comfort their age, or tend to their repose. In this Hotel, which is open from ten till four in the afternoon, every thing is interesting: whilst the order that prevails excites pleasure, the spectator always feels some veneration for the brave men who occupy this edifice, whose wounds recal their military virtues and their exploits in the field.

LYING-IN and FOUNDLING HOSPITAL.—In this hospital there are two distinct departments, the lying-in and the nursery, each of which occupies a separate building. The lying-in rooms are kept very clean, and perfectly well-aired, containing not more than six women each. Upon an average, the number of women is about 200; in general fewer in summer than in winter; 1500 women are annually delivered in this hospital. Here married pregnant females are received, as well as those who have become mothers without the sanction of the law. Hence

the horrid crime of infanticide, and other abominable practices, so common in England, are unknown in France, and indeed on the continent in general. This plan, however, was only adopted in 1792. A female performs the office of midwife. The nursery department is by far the most considerable; the plan of it is very ingenious. There is one room appropriated to the reception of the new-born children, and the feeding them till they are provided with nurses. This ward of fifty or sixty infants, who are all in their cradles, ranged in lines, forms a most interesting spectacle. The total number of children, annually born or received into the hospital, is between 5 and 6000. In the year 1790 the number received was 5842; but in the year 1793, a supposed period of general dissoluteness, there were not more than 3000 taken within the walls of the hospital. Another foundling hospital is the

Hospice des Orphelins.—Infants deprived by death of their parents, or abandoned by them, are received here without question, recommendation, or inquiry; and are nursed with tenderness, well fed, properly educated, and lastly qualified for some trade or profession, in which they are afterwards placed at the public expense. Their infancy is passed in the hospital; but they are sent into the country at a certain age for the benefit of the air, and then return to complete their education.

Bureau des Nourrices, Establishment for Nurses.—Ladies, who are unable to nurse their own children, may at all times find here nurses, in whom they can place unlimited confidence. The health and morals of these nurses are scrupulously examined, and their conduct diligently observed by agents of the bureau, from whom they receive their salary, and who are responsible for their behaviour. Infants may likewise be sent here to be nursed. Young married women of good character easily gain admission here for themselves and their infants, on the condition that they will take the charge of another child. They are comfortably lodged, and have a sufficient gratuity. The ward presents a curious and interesting spectacle. Every bed is placed between two cradles, one for the élève, and the other for the nurse's own child.

La Société maternelle—visits pregnant women, and provides for their lying-in, and for the suckling of their infants.

HÔPITAL de la CHARITÉ—was founded by Mary de Medicis in 1602. It receives only men attacked by acute diseases, or who have suffered by accidents; and can accommodate 230. A Clinical School is now established here. The disposition of the different baths is very ingenious.

Etablissement pour les Blessés Indigens, Establishment for the Wounded Poor.—M. Dumont, a celebrated surgeon, had long gratuitously attended to the accidents of the poor. His patients became so numerous that his private fortune was not sufficient to supply them with the necessary bandages and medicines. To enable him to continue his benevolent undertaking, government now allows him 2000 francs per annum.

MAISON de SANTÉ, Faubourg St. Martin.—The regulations of this house are peculiar. Every patient is compelled to pay two francs a-day for admission into the common wards. For three francs each patient has a chamber to himself. This establishment is ingeniously and humanely contrived for those who are unable to procure proper medical assistance, yet whose pride will not permit them to apply to a common hospital.

HOSPICE des QUINZE-VINGTS, Hospital for the Blind; Rue de Charenton.—It was founded so long ago as 1260, by St. Louis. Here are maintained 420 blind persons, most of whom are taught to do something towards their support; 120 out of this number are young persons, and are formed into a school, called *Institution des Jeunes Aveugles*. The public examinations are on the 26th of every month. Among the different employments in which they are engaged, is a cloth-manufactory. At these public meetings, blind persons, men, women, and children, may

be observed to read, write, count, print, and perform on different pieces of instrumental music. The mode by which they read is by feeling the letters, which are purposely raised on a card: and this they do with such rapidity, that it is difficult on hearing them to discover their misfortune.

There is a manufactory of steel carried on in the building; they also make whips, writing-cases, purses, and paper toys of all sorts, which are sold for their private emolument. There is likewise a press, or printing-machine, in which the whole process is performed by the blind. The women knit, sew, and perform other kinds of needlework; and all of them either sing or perform on some instrument: they often join in a numerous concert.

Institution des Sourds-Muets, Establishment for the Deaf and Dumb; Rue. St. Jacques.—The celebrated abbé de l'Épée, a name never to be pronounced without veneration, was the first man who formed a system of instruction for the deaf and dumb in France, which he published in 1776. He experienced its success for twenty years; during which time he had surrounded himself with all the deaf and dumb he could assemble. That respectable man employed his fortune in clothing and maintaining most of those unhappy beings; and all Europe has witnessed his talents, his constancy, and his success. At his death, which happened in the month of December, 1789, the abbé Sicard, his pupil, took his place as instructor, and some benevolent persons undertook to maintain the deaf and dumb. At the end of January, 1791, the National Assembly granted to that establishment the site of the Celestins, and founded an hospital for twenty-four children, with a pension of 350 francs for each child. Soon after the number of children gratuitously admitted was augmented to a hundred and twenty, and their pension increased to 500 francs. During the time of their living in the institution, which is five years, the pupils of both sexes are clothed and maintained; they are taught reading, writing, arithmetic, and drawing. Any parent who can afford to pay a pension of 800 francs for his child, may send him to this establishment.

A few of the pupils have been taught to read and pronounce aloud any sentence written for them; but, as may be expected, the pronunciation, not being imitation, and being wholly unheard by the person who utters, is incorrect. It is the effect of a compelled mechanical exertion of the organs of speech, produced by the abbé's placing his lips and mouth in certain positions, and appearing to the scholar to make certain motions, who, in endeavouring to imitate such motions, necessarily brings forth a sound, more or less like that required. The degree of force which it is necessary the scholar should apply to pronounce distinctly any word, is regulated by the abbé's pressing his arm gently, moderately, or strongly. We believe that Dr. Watson, of our Deaf and Dumb Asylum, is by no means behind the abbé Sicard in his successful endeavours at opening the mouths of the dumb. See the article *DEAF AND DUMB*, vol. v. and *DUMBNESS*, where Dr. Watson's method is detailed, vol. vi.

The institution is open to the public every Thursday from eleven to one. At the end of every month, a public examination takes place, at which the spectators may appreciate the nature and utility of the plan and mode of culture. Exclusive of religious and moral instruction, also in logic and reasoning, writing, reading, and arithmetic, the art of design, the elements of geometry, geography, and history, the deaf and dumb are also employed in mechanics, joiner's work, and in a number of small fabrications, curious and ingenious. These exercises are extremely well attended, chiefly by persons of respectable appearance. At one of these lectures, the abbé Sicard stated a very curious occurrence. After having observed that our blind Sanderson, on being asked to describe the sound of a trumpet, compared it to the colour red, he stated, that a deaf and dumb pupil, having been desired

to define his idea of red, immediately answered, it resembled the sound of a trumpet.

The number of deaf and dumb throughout France is estimated at 9000. The abbé Sicard, is at present preparing a synopsis of all such institutions as have been established, not only in France, (where there are upwards of twenty,) but throughout all the known countries.

HOSPICE de St. PÉRINE.—This, though not exactly a charitable institution, deserves notice in this place, from its very excellent regulations. Here men and women, when they have reached seventy years of age, or sooner if infirm, can, *by right*, and without asking the favour of any one, place themselves, in order to pass the remainder of their days in comfort and repose. A subscription is the essential and indispensable condition of acquiring the right of admission; according to which, every subscriber must pay regularly and punctually, 10d. per month, from ten till thirty years of age; 1s. 3d. per month from thirty to fifty; 1s. 8d. per month from fifty to seventy years of age. These different payments will amount to 45l. which must be completely paid before a person can acquire the right of admission. Hence, if any one more than ten years of age should offer as a subscriber, he or she must deposit, at the time of subscription, and according to his or her age, the sum which would have been paid if the subscription had commenced at ten. In order to give encouragement to benevolence, all persons who may be disposed to subscribe, may transfer their right to as many persons as they have made subscriptions, on condition that the person who shall be benefited by the transfer, shall be, as nearly as possible, of the same age as his benefactor, and that he shall not be admitted before he has reached seventy years of age, and paid the 45l. This transferred subscription is extinguished by the death of the substitute. The funds are placed on securities, and subjected to an administration which is in every respect safe and undeniable.

The house of this institution is most beautifully situated at Chaillot, about two miles from Paris, commanding a most extensive view of the city, the Seine, and the Champ de Mars. In front there is a very large and elegant parterre, terminating in an extensive kitchen-garden; behind, there is another large house, formerly the monastery of St. Perine, which forms a part of this establishment; and a field, of about four acres, bordered by a well-cultivated garden. In this establishment are nearly one hundred aged persons, male and female, whose manners and appearance evidently bespeak that they have figured in the genteeler walks of life, and whose countenances indicate the most perfect happiness and contentment. The chambers occupied by the female part of the society compose the right wing of the house: each female has a bed-chamber to herself exclusively; and there is one sitting-room or parlour appropriated to two females. The left wing of the house is occupied by the males, who are distributed in the same manner as the females, each person having a bed-room to himself, and a common parlour being allotted to two persons, in which they receive the visits of their relatives and friends, without the inconvenience of being obtruded upon by strangers. A husband and wife have always a room to themselves.

Their diet corresponds in every respect with the neatness and simplicity of their apartments. At one o'clock a plentiful dinner is served up in the hall for the whole society; and at seven they again assemble to supper. Besides a sufficient quantity of meat and vegetables, each person is allowed a pound and a half of bread, the men a bottle of wine, and the women half a bottle, daily. In case of sickness, they are removed to a particular part of the house, which is used as an infirmary, where they are provided with every medical assistance, and experience every possible attention; and, in case of their decease, they are decently interred in the neighbouring church at the expense of the society, or elsewhere at the expense of their friends.

Their time is entirely at their own disposal. They may even employ themselves in any lucrative occupation, provided it does not interfere with the quiet and general rules of the house. Several females very profitably engage in needle-work for their friends and families. What little pecuniary emoluments they may acquire by their industry supply them with pocket-money. The men usually pass their time in reading, walking in the neighbouring fields, or occasionally working in the garden.

There are several other excellent establishments of this nature, among which are the *Hospice des Menages*, Rue de la Chaise; and the *Maison de Rétraite*, on the road to Orleans, near the Barrière d'Enfer. The first of these was formerly called *Les Petites Maisons*, from the lowliness of the building.

Hospice des Incurables Femmes, Hospital for Incurable Women; Rue de Sévres.—Cardinal Rochefoucault founded this hospital in 1637. Five hundred and ten aged women, lame, palsied, or blind, are comfortably lodged, fed, and clothed, here.

Hospice des Incurables Hommes, Hospital for Incurable Men; Faubourg St. Martin.—This building was formerly a convent. In 1790 it was devoted to its present and better purpose. Four hundred infirm old men find here a comfortable retreat.

Hospice de la Salpêtrière, near the Garden of Plants.—This immense pile of building was begun by Louis XIII. in 1656, and finished in the year following. It derives its name from a saltpetre manufactory in the neighbourhood. The building is fine, presenting a majestic façade; and its boundaries are so extensive, that it is almost a little city. Here 1600 girls are employed in making linen and in working lace. Old married men, young women affected with madness, and female idiots, here receive those little comforts of which their respective situations still allow them to partake. A part of this building is for prostitutes. There are usually about 8000 persons in this place, most of whom are employed in some useful works. Here are 600 insane persons under the care of the celebrated Pinel, from whose works we largely borrowed under our article INSANITY.

The *Bicêtre*, which has already been noticed as a prison, is a similar institution to the Salpêtrière, but confined to men only. At a distance it has the appearance of an immense pile of fortifications. On a nearer approach the hospital is found to be unusually lofty, and surrounded by a fossé. The proportion of *old* men in this institution is great, and almost incredible. It is said that there are often more than two hundred who are upwards of 70 years of age. The accommodations for the insane are not so convenient as humanity requires. They are damp and ill ventilated; but the infirmary is remarkably well arranged. The immense kitchens, and the well, 207 feet deep, are generally shown to strangers.

SOCIÉTÉ PHILANTHROPIQUE, the Philanthropic Society—supplies the poor with soup at a low price, visits the sick and indigent, and affords them relief in food, money, and medicine, and administers to them the consolations of religion. There are four Dispensaries belonging to this society, which is composed of the principal people in Paris. Two hundred thousand francs, more than 8400l. were distributed in this way in 1813. It bears some resemblance to the Strangers' Friend Society of London, conducted by the Wesleyan Methodists.

Secours à Domicile, Relief to the Poor at their own Habitations.—The relief distributed by the benevolent committees of the 48 districts of Paris, from the general funds of the different hospitals, is destined for old men and women of more than 70 years of age, the infirm, and poor women with large families; it consists of bread, meat, milk, flour, and, in winter, wood for firing. It also includes gratuitous advice and medicines in case of illness.

We have been thus particular in describing the principal hospitals and benevolent establishments of Paris, (a place which, exclusive of strangers, does not contain more

than half the population of London,) for the benefit of the philanthropic traveller, as well as for the information of our prejudiced countrymen, who are too apt to fall in with the common cant of the day, and assert that benevolence and religion are to be found in no country but their own. Benevolence and human kindness flourish and spread their friendly shade in every climate under heaven; and we are too often led to doubt their existence, only because we are unacquainted with the place of their growth.

It is a remarkable circumstance, that, notwithstanding this long list of charitable institutions, and the numerous public and gratuitous schools which exist, the poor of Paris are more in number, and more idle, than in any other city in Europe. This arises from the ease with which relief is obtained, without character and without exertion, and from the means of dissipation which the poorest person always finds in that gay metropolis.

Much has been said for and against the system of poor-laws that prevails in our own country. By many they are considered to be "the result of a humane but mistaken policy, grown into an intolerable abuse." Yet we must be permitted to observe, that there have been laws for the compulsory relief of the poor in all countries; and we find them at this moment in full operation in Switzerland. At Paris, however, the evil seems at its height; public documents show, that there are in that city considerably more than 100,000 individuals, or more than one-seventh of the whole population, who receive support from public charity; and it is, if possible, a still more appalling fact, that *one-third* of the inhabitants of that splendid and luxurious metropolis dies in its hospitals. The number of common beggars about the streets of Paris, and on the high-roads of France, is beyond all comparison greater than with us.

The Rapport au Conseil General des Hospices, &c. states the number of sick admitted into the different hospitals of Paris, in ten years, from 1804 to 1814, to have been

Those admitted into the different hospices during the same period	352,913	dead	47,861
	50,464	dead	12,577

	403,377	60,438
--	---------	--------

A more recent report shows a great increase: 42,442 individuals have been admitted in the different hospitals and hospices of the capital in the year 1818: 7043 have died; and the total number of deaths at Paris has been 22,382. In 1819, 7310 have died in the hospitals and hospices, out of a total number of deaths at Paris of 22,137. The number of individuals more or less assisted at public expense at Paris, has been for the first period of ten years, 104,000 annually; in 1818, the number was 108,742, including 17,247 foundlings.

PLACES OF AMUSEMENT.

It has already been stated that the French are a dramatic people. The numerous theatres which are open and crowded every night, and the superior manner in which the business of each theatre is conducted, are sufficient proofs of this. At one period of the revolution not less than thirty houses were nightly filled; and it is said that two thousand new pieces were offered to the public in one year, of which not more than a twentieth part survived the first representation. Government, at length, prudently interfered, and limited the number of the great theatres to four, and the minor houses to six.

In one respect the French stage is certainly superior to the English. Very few of the plays have an immoral tendency; and vulgar and gross double-entendres would excite universal disapprobation. It is a problem which we leave to the metaphysician or the moralist to elucidate, that, while in France all the principles of private and domestic virtue are plainly and proverbially loose, their theatrical pieces breathe the purest sentiments, and inculcate the noblest maxims; yet, in England, where the domestic

domestic virtues have established their peculiar empire; the moral of many of the most favourite dramas is worse than equivocal, and female delicacy is too frequently shocked with the most vulgar and palpable ribaldry. Connected with this is another circumstance, the explanation of which we likewise leave to others. In England, where female chastity is justly considered as the sex's point of honour, and a lapse from it is never forgiven, the managers of the national theatres have built accommodations expressly for the most degraded class of society. They nightly encourage scenes offensive to delicacy, and subversive of good morals; and may truly be said to share, not only in the gains, but in the very business, of the brothel-keeper. In France, however, where fidelity to the marriage-vow is little regarded; where the female who has forgotten the duty which she owed her husband, and dishonours herself, is on that account treated with no contempt, and excluded from no society; the theatres are perfectly free from the intrusion, or, at least, from the disgusting conduct, of the women of the town.

Sentinels, more numerous than at the English theatres, guard all the avenues, and preserve order in the interior. The people who wait the opening of the doors are regularly arranged in files of two or three abreast; and, although the crowd probably consists of several hundreds, no pressure or inconvenience is felt, and every person is gently and quietly admitted in his turn. At leaving the theatre not the smallest confusion or uproar takes place. No person is permitted to call his carriage until he is actually waiting for it at the door; and, should not the owner step into it in an instant, it is ordered off by the police, and makes way for another. By this arrangement, the company is dispersed in an inconceivably short space of time.

No very profuse decoration is bestowed on the interior of the Parisian theatres; and the mode of lighting them has some resemblance to that at Astley's Amphitheatre, which is now adopted at Covent Garden and Drury Lane. An enormous chandelier, or rather a double row of Argand lamps, is suspended from the centre, which diffuses a gentle and agreeable light through the whole house. The light is not so brilliant as at the London theatres, nor so favourable to the display of female beauty which the boxes occasionally exhibit; but it much increases the effect of the scenic representation.

When a favourite actor appears at the commencement of his part, he is usually greeted, as in London, with enthusiastic applause; but, according to the proper etiquette of the French stage, he seems to be perfectly insensible to the rapture with which he is hailed. He returns not the slightest gesticulation, but stands in the proper attitude of his character until the acclamations subside, and he can be heard. But, when he has finished his part, and is again summoned on the stage once more to receive the applauses of his admirers, when he is no longer the monarch or the hero, he can, without impropriety, express his genuine feelings, and he acknowledges the kind patronage of the audience by many a bow of respectful gratitude. After the successful performance of a new piece, the name of the author is loudly demanded, and his appearance on the stage required. The moment he is seen, the house rings with acclamation; he replies with a few humble conges, and retires.

The manner of remunerating the authors of successful pieces deserves notice. They are allowed a certain share of the profits during life, and the benefit descends to their family for ten years after their decease. This regulation extends through every theatre in the whole French empire. No provincial manager can exhibit the production of any living author without making him this allowance. The proportion depends on the celebrity of the author, and the specific agreement between him and the manager. It sometimes amounts to one-sixteenth, but occasionally does not exceed a sixtieth. A few authors, as Dacis and Picard, derive a handsome revenue from this source.

The boxes at the principal theatres usually contain six persons; but a small party may take any box on paying for five places. A ticket is immediately placed on the door stating that it is let; and no other person is permitted to intrude during the whole of the night, although the box may not be occupied by more than two or three.

L'OPERA, ou *Académie Royale de Musique*; the Opera House; Rue Richelieu.—Cardinal Mazarine first introduced the Italian opera into Paris, for the amusement of Anne of Austria, in 1646. The present house has nothing remarkable in its exterior but a heavy colonnade of eight arcades. The interior presents a far more splendid appearance than either of the other theatres, but is decidedly inferior to the national theatres in London. This theatre presents a striking exception to the remark we have made on the want of variety in the scenery. Nothing can exceed its splendour or beauty, or the adroitness with which it is managed.

The performances of the opera resemble those of the house of the same name in London, except that the poetry and music are frequently French. The orchestra is superior to that in London, and probably unequalled in Europe; but the singing is scarcely above mediocrity. This will be easily accounted for, when it is recollected that few Italian singers are engaged here. For the beauty and splendour of the ballet, and the excellence of the dancing, the Opera is deservedly celebrated. It is far superior to any thing which the rest of Europe can afford. France is the native land of dancing, and in her grand national theatre we may expect to see the very perfection of the art; nor will that expectation be disappointed. The principal charm of the ballets of the opera consists in the uniform excellence of *all* the performers; but it is only where dancing is an object of universal and passionate admiration that we may hope to see almost every figurante on the boards displaying an elegance, agility, and knowledge of the art, which would apparently enable her to fill the most important parts.

The performances are on Mondays, Wednesdays, and Fridays. The prices of admission are—balcony, 10 francs; first and second tier of boxes in front, amphitheatre and orchestra, 7 francs 10 sous; first and second boxes at the sides, and third boxes in front, 6 francs; third tier of boxes at the side, 4 francs; fourth and fifth boxes, and pit, 3 francs 12 sous. The doors open at six, and the opera commences at seven.

THEATRE FRANÇAIS, in the same street.—This theatre likewise presents nothing striking in its exterior. Its peristyle towards the street is of the Doric order, and is composed of eleven intercolumniations, forming ten arcades. Above are pilasters of the Corinthian order, whose entablature is cut by a range of small windows. The principal saloon is of an elliptical form, and is surrounded by three rows of Doric columns. The first row is coupled; the two others are insulated. The ceiling is adorned with sculpture and arabesque ornament. Four staircases ascend from the saloon to the different divisions of the house. The theatre is 69 feet wide, and as many in depth, and the stage presents an opening of 38 feet. The internal decoration of the house is far from attractive, and consists principally of a dingy yellow marble.

This theatre is consecrated to the exhibition of the classical productions of the best French writers. Racine, Corneille, Voltaire, Crébillon, and Molière, are the sources from which its most frequent and most approved performances are selected; and no attempt has been made to disgrace the immortal productions of genius, by false ornaments, and contemptible pageants.

Among the tragic actors here, *Talma* stands alone; the actresses, Mad. Duchesnois, George, and Volnais. The most celebrated female performer in comedy, is *Mademoiselle Mars*, whom it is impossible to name, without paying her a tribute of applause: "Mademoiselle Mars is probably as perfect an actress in comedy as any that ever appeared on any stage. She has united every advantage of

of countenance, and voice, and figure, which it is possible to conceive; and no one can ever have witnessed her incomparable acting, without feeling that the imagination can suggest nothing more completely lovely, more graceful, or more natural and touching, than her representations of character. Mademoiselle Mars has been most exquisitely beautiful; and, though the period is past when that beauty had all the brilliancy and freshness of youth, time appears hardly to have dared to lay his chilling hand on that lovely countenance, and she still acts characters which require all the naïveté, and gaiety, and tenderness, of youthful feeling, with every appearance of the spring of human life." *Travels in France*, vol. i.

This theatre is open every night. The prices of admission are—to the balcony, orchestra, and first boxes, 6 francs 12 sous; first gallery and second boxes, 4 francs 8 sous; third boxes, 3 francs 6 sous; pit, 2 francs 4 sous; and second gallery, 1 franc 16 sous. The doors are here likewise opened at 6 o'clock, and the entertainments commence at 7.

The ODEON, burnt down March 20th, 1818, but now rebuilt; Faubourg St. Germain.—A French company plays here four times a-week; but the situation of the house is not favourable: it is on the south of the river; and its own regulations form another obstacle to its success. Obligated to play such pieces as have been rejected by the Theatre Français, or others still inferior, they can neither satisfy the small number of the amateurs of good comedy, nor the public at large, who are not easily put off with fingering or mere stage-effect. This theatre, though not so well laid out as it was before the revolution, is still the handsomest and the most commodious in Paris. The exterior is superb, and makes us regret that this house is not situated in a more frequented part of the town.

The performers of the *Opera Buffa* play alternately with those of l'Odeon. Madame Fodor, who performed with such applause at the King's Theatre in London, was engaged from the Odeon.

OPÉRA COMIQUE, called Théâtre Feydeau, from the name of the street it stands in.—The exterior of this theatre is almost concealed by surrounding buildings. The interior much resembles that of the French Theatre. Its name well expresses the entertainments that are usually given here. They are principally operas, representing country scenes, like the English operas of *Rosina*, *Love in a Village*, &c. It must, however, be acknowledged, that the French give an interest to these rural pictures seldom felt on the English stage.

THÉÂTRE DES ITALIENS, Rue Favart.—This edifice was erected by M. Heurtier, in 1782, on the site of the Hotel de Choiseul. A peristyle of six columns, of the ancient Ionic order, forms the only ornament of the façade: the proportions of the columns are grand, but altogether without decoration: the entablature has a heavy appearance. Some years ago this little theatre was taken by Madame Catalani, who engaged a small company of Italians, and exhibited here her unrivalled powers of voice. The speculation did not prove so lucrative as she expected. The prices were too high: first boxes, 10 francs; second boxes, 6 francs 14 sous; pit, 3 francs 12 sous; amphitheatre, 5 francs 10 sous.

THÉÂTRE VAUDEVILLE, Rue de Chartres.—This is the chief of the minor theatres, and always attracts crowded audiences. The performances consist of short yet interesting comic sketches interspersed with little songs (vaudevilles), either amatory, sentimental, or epigrammatic. These songs are usually furnished by a club of wits, whose meetings are known by the name of *Les Diners du Vaudeville*. The passing events or occurrences of the day often form the subject of little comic or serious pieces. Happy parodies are frequently given of the spectacles of the larger houses. The performances begin every night at seven; and the prices are moderate; first

boxes, 3 francs 10 sous; second boxes, 3 francs; third, 2 francs 4 sous; fourth, 1 franc 10 sous; pit, 1 franc 12 sous.

THÉÂTRE des VARIÉTÉS, Boulevard Montmartre.—This little theatre, designed for pieces of a burlesque and popular kind, was built by Cellerier in 1807. The exterior has four Ionic over four Doric columns, crowned with a triangular pediment. The style of building is simple, light, and theatrical.

The pieces performed here profess not to rank higher than farces. *Les deux Boxeurs*, a theatrical caricature of the English boxers, and *Les Anglaises pour rire*, had great runs. The English in Paris are constant in their attendance at these grotesque representations.

THÉÂTRE de la GAIÉTÉ, Boulevard du Temple.—Of the melo-dramas, such favourites with the public for many years past at this place, it may be said nothing is more interesting, humorous, or amusing, or more pathetic, than the pieces produced by MM. Caignez, Pixerecourt, Varez, &c. The Dog of Montargis is not yet forgotten at this theatre; but what animal will be made use of next, is beyond conjecture, though there is no doubt that the actors will do their duty, whether bipeds or quadrupeds. This, however, is the chief of the melodrame theatres; and we are assured by Mr. Planta, that, in this particular line, "they are decidedly superior to any of the minor theatres in London." The ballets, and the dancers of both sexes, are also of a superior kind. The doors open at five, and the performance begins within half an hour after. Prices: first boxes, 3 francs 12 sous; first and second boxes in front, 2 francs 8 sous; orchestra and front gallery, 1 franc 16 sous; second gallery, front, 1 franc 10 sous; pit, 1 franc 4 sous.

L'AMBIGU COMIQUE, Boulevard du Temple.—This worthy rival of its neighbour never ceases to attract a crowd, even in summer; and, like it, owes its popularity to the productions of MM. Caignez and Pixerecourt. Many rival writers, and among these some ladies, have endeavoured to share the palm of the *melodrame* with these gentlemen; but hitherto none of them have been able to deprive them of their titles, as the Racine and the Corneille of the Boulevards. These two theatres, whatever may be the aspect of the political horizon, never know any relaxation.

THÉÂTRE de la PORTE St. MARTIN.—This house was originally designed for the opera; but it was afterwards considered to be too distant from the court. It is now appropriated to the same kind of performances as the Ambigu Comique. The interior of the theatre is peculiarly elegant. The favourite melo-drama of the Maid and the Magpie was brought out here, and attracted crowded audiences at the period when the cannon of the allies could be distinctly heard from the Boulevards.

THÉÂTRE de BIENFAISANCE, Theatre of Benevolence; Rue St. Denis.—The pieces represented in this structure are performed by blind persons; and the profits are appropriated to the support of this unfortunate and interesting part of the community.

CIRQUE OLYMPIQUE, the Olympic Circus; Faubourg du Temple. The entertainments exhibited on this stage resemble those of Astley's, and are scarcely inferior to them. The house is spacious and elegant, and the whole is under the direction of M. Franconi, whose family are the principal performers. The intelligence, docility, and activity, of two young stags, are much admired. Prices: stage boxes, 4 francs; first boxes, 3 francs; circular boxes, 2 francs 8 sous; second boxes, 1 franc 16 sous; third boxes, 1 franc 4 sous. The doors are opened at six, and the entertainments commence at seven.

THÉÂTRE PITTORESQUE et MECANIQUE, Picturesque and Mechanical Theatre; Rue Montesquieu.—M. Pierre, the inventor of this pleasing exhibition, is dead, but his former assistants continue it with undiminished attraction. It was exhibited in London, at the Sans Pareil Theatre in the

the Strand, and at Spring Gardens; but did not excite the attention which it merited. It consists of a representation of landscapes, cities, sea-ports, &c. the different parts of which are in relief, and admirably contrived to render the perspective complete, and the general appearance of the whole highly interesting. This scene is enlivened by numerous animated figures; carriages of every description cross the bridge; boats sail up the river; pedestrians crowd its banks; the sun gradually rises; the appearance of the sky perpetually changes, and occasionally the grand accompaniments and effect of a storm are portrayed. The exhibitions are changed every month, and a pleasing panorama is given of all the principal cities in Europe, with the peculiar costume of each. First places, 3 francs; second, 2 francs; third, 1 franc.

There are various other inferior exhibitions of Panoramas, Cosmorama, Pansteromas, Phantasmagorias, &c. which are not worth enumerating. Punch and his family, who are itinerary with us, are stationary at Paris, under the elegant title of *Théâtre des Marionnettes*, on the Boulevard du Temple.

M. *Olivier* exhibits his sleight of hand, and feats of strength, at the Rue des Petits Champs.—M. *Comte* has also an exhibition of legerdemain, to which he adds the most wonderful specimens of ventriloquism, in the Rue de Grenelle.

Modèles des Ruines Antiques, Models of Ancient Ruins; Palais des Beaux Arts.—Here is a beautiful, interesting, and curious, model, on a large scale, of the ruins of Palmyra, or Tadmor in the Desert, built by Solomon; a city famous for its founder and for its fall, as well as for its unrivalled magnificence. That city, which Gibbon calls “the seat of arts, of sciences, and of Zenobia,” exhibits even at this distance of time, a forest of majestic columns, such as are not to be seen in any other part of the world. See the article PALMYRA, and the correspondent Engraving, at p. 297-300.

There are some other curious models of ruins to be seen, by application at the Palais Royal.

Spéctacle Instructif, Boulevard Montmartre.—This is an exhibition similar to that which Bologna attempted during the lent-season of 1820, in Catharine street, Strand. The electrical, galvanic, and optical, experiments, although not new, are the most brilliant which those branches of philosophy present. Some of the acoustic machines are curious. The Chinese shades are superior to those usually seen, and the Phantasmagoria is sufficiently terrifying. It is open every night at half-past six.

COMBATS des ANIMAUX, Combats of Animals; near the Barrier St. Martin.—This singular and disgraceful spectacle is more frequented than is honourable to the humanity of the Parisians. It consists of an enclosure surrounded by a gallery, under which are the dens of various wild and ferocious animals. At a short distance are kennels containing fighting dogs of every description. Any person who wishes to try the courage of his dog, may, for a certain gratuity, select an antagonist from the kennels. But on Sunday, and every festival, a public exhibition takes place, when it is crowded by gentlemen of a certain description, and by those whose education and rank in society should have taught them better feelings. The entertainments commence about five o'clock by various dog-fights. To these succeed bull-baiting, bear-baiting, wolf-baiting, and wild-afs-baiting; hyænas, wild-boars, &c. are added to the sport. The humanity of the spectators, or the avarice of the proprietors, usually interferes to preserve the lives of the various animals; but they are often sadly worried and mutilated. The amusement usually concludes, on grand festivities, with a ludicrous but cruel scene. A bear is compelled to climb a pole. He is then surrounded with fire-works, which not only terrify him by their explosions, but evidently torture him by their flames. He is afraid to escape by one bold leap, and he is equally afraid to slide down through the fires which are blazing underneath him. The clumsy

and grotesque attitudes by which he expresses his terror and his pain, excite shouts of pleasure from the greater brutes with which the galleries are thronged. The baited animals are fastened with ropes to a ring in the centre of the amphitheatre, and the keepers manage them with wonderful dexterity.

LA VEILLE'E, the Evening's Rendezvous; Place du Palais.—This establishment, situated in the centre of Paris, presents a most interesting display of blooming verdure even in the winter-months, when the frost and snow seem to defy the power of vegetation. By a happy contrivance, the scenery changes at every step; and nothing has been omitted to render La Veille'e a complete fairy-land. New and superb decorations, costumes the most brilliant, pleasing and variegated scenery, amusements without number, every thing here unites to rivet the attention, and give an additional zest to gaiety.

Two orchestras are placed in the building for the accommodation of the youthful dancers. Children are captivated with amusements adapted to their time of life; while in two apartments, artfully constructed, are to be found those resources from reading and conversation which are calculated to interest the mind of age. Within this fascinating edifice are also two theatres, in which are represented light and playful pieces. In a rustic cot a dairymaid sells cream. In various grottos every cooling liquid is to be procured. A restaurateur offers every kind of refreshment. Shops, playfully contrived, exhibit arms and millinery, books and toys. Notwithstanding, however, all this display of diversified allurements, the establishment was not capable of supporting itself. It is now seldom open, except at periods of public rejoicings, and during the season of the winter-balls.

TIVOLI, Rue St. Lazare.—This delightful garden is open only during the summer. It has been termed the Vauxhall of Paris. It is infinitely superior to that celebrated place in the day, but certainly yields to it in the decorations which it presents at night. It has none of the formality of the English Vauxhall. The walks, bordered with roses, honeysuckles, and orange-trees, pleasingly wind in various directions, discovering an interesting succession of objects at every turning. The lawns exhibit rope-dancers, mountebanks, grimacers, groups riding at the ring, or playing at shuttlecock, and innumerable parties in the little bowers around, gazing on the amusements, and sipping their lemonade or orgeat. In the centre is a stage for dancing. The waltz is still the favourite dance; nearly two hundred couples may sometimes be seen following each other through the giddy and voluptuous whirls of this fascinating but dangerous amusement. The visiter must bring his partner with him, or he will not easily meet with a fair one willing to admit a stranger to the freedoms which this dance allows. Several little canals intersect the garden. Several diminutive boats are on the bank, with which the visiter may amuse himself, while the shallowness of the water secures him from every danger beyond that of a complete ducking.

In the evening these gardens are splendidly illuminated; a tolerable concert is given; additional bands of musicians await the command of the dancers; and an exhibition of fire-works takes place at ten. On gala and festival days, additional decorations and amusements are presented. The price of admission in the day is one franc, three francs at night, and five francs on festivals.

GUINGUETTES et. BASTRINGUES.—The Guinguettes are the gardens in the suburbs or environs of Paris, to which the lower classes are accustomed to resort on Sundays and festival days, and regale themselves at a trifling expense. Provisions of every kind may be procured here, ready dressed. When a guinguette adds an orchestra and a room for dancing to its other attractions, it is called a Bastringue.

The most celebrated are—the Grand Saloon, Faubourg Montmartre; the Hermitage, at the foot of Montmartre;

Fanchon la Veilleuse, Boulevard du Mont Parnasse; Le Salon de Varlet, Boulevard de l'Hopital; the Great Rotunda, in the Elysian Fields; and those at Vaugirard, under the walls of Paris to the west. The stranger will probably occasionally look in at some of these places, for there he will form the most correct idea of the real characters and manners of the mass of the French people.

BRIDGES, QUAYS, AQUEDUCTS, MARKETS, &c.

PONT NEUF, the New Bridge.—“Of all the bridges,” says Sterne, “it must be acknowledged that the grandest, the lightest, the longest, and the broadest, that ever joined land to land, is the Pont Neuf.” The first stone of this bridge was laid by Henry III. in 1578; and the foundation of the piles was begun to be formed on the opposite side, when the troubles of the League forced the architect, De Cerceau, to withdraw to foreign countries. The work was not resumed till the reign of Henry IV. it was finished in 1674. The length of the bridge is 1020 feet, and its breadth 72 feet, which is sufficient to admit of five carriages passing abreast; it is formed of twelve arches, seven of which are on the side of the Louvre, and five on the side of the Quai des Augustins, extending over the two channels of the river, which is wider in this place, from their junction. In 1775 the parapets were repaired, and the footway lowered and narrowed. Soufflot, the architect of the Pantheon, availed himself of the opportunity to build, on the twenty half-moons which stand immediately above each pile, as many rotundas, in stone, to serve as shops. On the outside, above the arches, is a double cornice, which attracts the eye of the connoisseur in architecture, notwithstanding its mouldering state, on account of the fleurons in the antique style, and the heads of sylvas, dryads, and satyrs, which serve as supports to it, at the distance of two feet from each other. As the mole that forms a projection on this bridge, between the fifth and the seventh arch, stands facing the Place Dauphine, which was built by Henry IV. it was chosen for erecting to him a statue, which was the first public monument of the kind that had been raised by the French in honour of their kings. The statue was of brass, representing the king on horseback. It was erected in 1635. The figure of the king was beautiful, and of excellent workmanship; it was cast by Dupré. The horse was executed by the famous Jean de Boulogne. Cosmo II. duke of Tuscany made a present of this fine piece of foundry to Mary de Medicis, then queen dowager and regent of France. Although the portraiture of the king did great honour to Dupré, yet the greatest praise was generally bestowed upon the horse; which circumstance gave occasion to the following epigram:

Que sert-il que Paris, au bord de ce canal,
Expose de nos rois ce grand original,
Qui sçut si bien regner, qui sçut si bien combattre ?
On ne parle point de Henri-quatre,
On ne parle que du cheval.

At the beginning of the revolution, the statue of this beloved king was pulled down, and a colossal figure of Victory, or Liberty, or some other fashionable lady, was erected on the spot. But this disappeared with the glory of Napoleon; and, when the king entered Paris in 1814, a plaster-cast of the former equestrian statue was fabricated with astonishing celerity, and put up immediately; and there it remained, according to Tronchet's Guide to Paris, (6th edit.) in 1817; but Planta's Picture, (12th edit.) 1820, tells us, that an obelisk, 180 feet high, stands there.

This bridge is incessantly crowded with passengers, and exhibits a busy and interesting scene. It is the favourite resort of itinerant fruiterers and pedlars of every description, who line each side of it, and force the attention of the passenger by the most exaggerated and deafening history of the excellence of their wares. The dealer in books is posted next to the vender of hot sausages or fried plaice. Beside him is the polisher of shoes, while his neighbour

offers the most delicate cakes and preserves. Beyond him is a print-merchant, with engravings of every price, and suited to every taste. He is elbowed by a ballad-singer or a hawk of news. No sooner has the traveller escaped from his harsh and discordant note, than he is annoyed by the importunity of some canine tonfor, who, for a small gratuity, will clip his poodle, or his barbette, to the very height of the fashion. The professors of this last art are numerous in Paris; and some of them enjoy as much reputation, and reap as much emolument, as the scientific and justly-celebrated professor of canine and animal medicine in the western part of the English metropolis.

To the east of Pont Neuf the small islands in the middle of the Seine are connected to its banks by several bridges; to the west there are two, the Pont Royal and the Pont Louis Seize, both of which have been already described.

PONT NOTRE DAME, Our Lady's Bridge.—This is situated at the extremity of the Quay de la Megisserie. It was called in the fourteenth century, *Pont de la Plancher Milray*, and leads from Rue Plancher Milray to the city. It was rebuilt, on the plan of a cordelier named Joconde, under the reign of Charles XII. in 1499. Sixty-one brick houses, which it formerly bore, were taken down in 1786. In the middle is a pump, which supplies most of the fountains of Paris.

PETIT PONT, the Little Bridge.—This bridge forms a communication between Rue St. Jacques and the city. The time of its foundation is uncertain. It existed in the time of the Gauls; and when Lutetia was rebuilt by the Romans, a fortress was erected at its extremity. It was eight times carried away by floods; and in 1718 it was destroyed by fire in four hours, together with all the houses upon it: the conflagration originated from two boats laden with hay, which had anchored under one of its arches. In 1719 it was rebuilt, unencumbered by houses.

PONT MARIE, Mary's Bridge; near the Quai des Ormes. This structure was so named after the builder, who erected it in the reign of Henry IV. It was partly destroyed in 1658, but afterwards repaired, and quite divested of houses in 1789.

PONT de la TOURNELLE.—Stands on the quay bearing that name, and was so called from the castle which adjoined the gate of St. Bernard. The character of its architecture is very grand. It communicates from the port of St. Bernard to the island of St. Louis. It is the third bridge that has been erected on this spot. A wooden bridge, which existed in 1369, gradually decayed. A second wooden bridge was carried away by the ice. The city of Paris caused this of stone to be built in 1656.

PONT du JARDIN des PLANTES, originally *Pont d'Aufertlitz*.—This modern bridge forms a communication between the Boulevard of Bourdon and the Garden of Plants. It was completed in 1807. The piles are of stone, and the arches of cast iron. It has an air of great solidity and strength. A toll is exacted from all passengers. There is an extensive view to the east over the country bordering on the Seine; and to the west over the port of St. Bernard, and the beautiful quays of the island of St. Louis.

The name of this bridge was altered on the arrival of the allied troops in Paris; but the Austrians blew up part of the bridge before the authorities in Paris consented to the alteration.

PONT des INVALIDES, originally *Pont Jena*.—This bridge, opposite the Champ de Mars, was begun in 1806, and has not long been finished. It consists of five arches of equal size, and happily combines elegance with strength. On the second entrance of the allies into Paris, Blucher, offended at the name given to the bridge, ordered it to be blown up: it was, however, preserved by the prompt interference of the allied sovereigns. It leads from the Champ de Mars to a precipitous chalk-cliff on the other side,

fide, at the base of which are laid the foundations of a palace never likely to be finished, the Palace of the King of Rome.

The remaining bridges not already noticed are—The *Pont Grammont*, a wooden bridge which passes over a narrow channel from the Port St. Paul to the Isle Louviers. It is the only wooden bridge in Paris.—The *Pont de la Cité*, a curious structure of stone, iron, and wood, which connects the two isles (St. Louis and la Cité), and runs not across, but in the direction of, the stream of the Seine. Though built in 1803, it is already so insecure, that carriages are not permitted to pass over it: foot-passengers pay a sou every time they cross it.—The *Pont aux Doubles*, a small old bridge, with houses upon it, which, like the Pont Grammont, crosses only a small channel on one side of the river, and joins the Isle de la Cité to the main land on the south. The fare for passing it was formerly a *double*, a coin no longer in circulation; whence the name.

The bridges at Paris, owing to the elevation of the quays above the river, have very little ascent, and are therefore very convenient; they are, however, with the exception of the Pont Neuf, far inferior to the bridges of Rome or Florence; and in magnitude and grandeur they sink into insignificance when compared with the stupendous masses of Waterloo, Blackfriars, or Westminster.

QUAYS.—Forty-nine quays line the shores of the Seine, extending from east to west about five English miles, on both sides of the river, and which are at different parts distinguished by different names, though in reality they form only two immensely long quays.

The river Seine, which is a running river, and not a tide river, has no commerce but what is carried on by boats. The quays are merely stone embankments, without cranes for raising goods, or warehouses for receiving them, which are essential parts of what is properly termed a quay. These stone embankments were first begun in 1312, in the reign of Philip the Fair. The height of the stone-work is about fifteen feet, in some places built on piles, and in others on a solid foundation of earth.

Various sorts of goods are landed at different parts of the river; and these are termed *ports*, though there is no apparent mark of any thing like a port.

When it is considered that the waters of the river rise in winter about ten or twelve feet higher than in summer, it will be seen that an absolute necessity exists for having stone embankments; and the whole is so well executed, that the borders of the river, or quays, are the pleasantest and best walks in Paris, with the exception of the Boulevards and public gardens.

In the time of Philip the Fair, the *Quay of the Augustins* was a marsh covered with willows, and in summer a kind of promenade, though muddy at other times of the year, and subject to the inundations of the river.

The *Quai de la Mégisserie* was constructed in 1369. In 1642 the shores of the Seine, between the Pont Notre Dame and the Pont au Change, presented a shelving surface containing two dirty streets, with occupants equally disgusting; when the marquis de Gevres obtained leave to build between the two bridges, upon the condition that he should confine the river within a proper embankment.

The *Quai Desfieux*, on the other side, was begun in 1800 by the engineer Lamande. At present nearly 400 toises of new quays occupy the whole contour of the Isle de la Cité, and which afford many agreeable points of view.

The *Quai des Orfèvres* extends to Pont St. Michel; that connects with the other side of the same bridge, since the houses were pulled down that skirted the river in the Rue Sturepoix.

At the extremity of the *Quai des Celestins* is the Arsenal. The objects that will particularly interest a traveller in this building, are—a magnificent ceiling, painted by Mignard, and the cabinet in which Henry IV. used to unbohem his most secret thoughts to his incomparable

friend and counsellor, Sully. The chimney, near which he usually sat, is shown to the visiter. The marquis de Paulmy, who afterwards inhabited this hotel, would not permit the slightest alteration to be made in the arrangement or decoration of any of the apartments, but placed his chief happiness in living surrounded by those objects, on which that good king had gazed, or which he had touched.

No new quay has been made near the Pont Royal, a space always reserved by the French king; but since 1708 the *Quai d'Orsay* has undergone many alterations, and magnificent hotels have been raised on the banks of the Seine, under the promise of its completion. Till 1801 the intended designs were incomplete; but since that period, and within the course of three or four years, M. Lamande has executed the orders of government in the construction of a magnificent quay, upwards of 400 toises in length. As the different elevations of the two bridges serve as *points d'appui*, and the inequalities of the soil filled up between the two extremities of the line, the centre presents a fine front perfectly horizontal, which constitutes a regularity not to be found in any of the other quays. The height of this quay is about fifteen feet, and its foundation is partly upon terra firma, and partly upon piles. The space in front is about 92 feet by 100. Two handsome flights of double stair-cases lead to the quay, enriched with embossments, and ornamented in a similar manner with the extensive and beautiful façade. This imposing line of building, viewed from the opposite side the Seine, being raised in the most exact proportions, is undoubtedly the finest basement of all the edifices on this side of the river, amongst which is the pretty palace of the Legion of Honour.

Another quay is now carrying on beyond the Pont Louis XVI. to be continued as far as the Invalides.

AQUEDUCTS AND CANALS.—The *Aqueduct of Romainville* is the most ancient in Paris, being anterior to the year 1274; and this supplies the fountains of the Innocents, des Halles, and Maubue, with a quantity of water equal to 646 hogheads in twenty-four hours; but the supply from the aqueducts of Belleville and Mefnelmontant are not so copious.

Aqueduc d'Arcueil.—This was begun by Catharine de Medicis, and the first stone laid in 1613 by Louis XIII. Jacques Desbrosses was the architect. The length of this aqueduct is 1847 feet, its height about 74. It is composed of twenty arcades, with a cornice ornamented with modillions, and surmounted by an attic. The distance between Paris and Rungis, from whence the water is brought, is more than eight miles; this aqueduct supplies thirteen fountains; and near Rungis are the vestiges of that constructed by the Romans.

Aqueduc et Canal de l'Ouëre.—This canal, which is upon an elevation considerably above the Seine, supplies Paris with 972,000 hogheads of water in the course of every twenty-four hours. The length of this canal from its head to Lizy is about twenty-four leagues. In its course it receives the rivulets Grifette, de May, Terrouane, and Bevrone; it terminates in the great basin de la Villette, and is at the same time a port for vessels from the Marne, a reservoir for the people of Paris, and a handsome ornament to the barrier of St. Martin. The celebrated engineer M. Girard is now engaged in bringing the Canal de Courcy to supply Paris with water; magnificent works are constructing, extending from the canal in a line below Montmartre through Mr. Grefnuel's park, which will form a reservoir running the whole length of Paris, and save the expense of steam-engines; one league and a half has already been finished.

The borders of the basin near the barrier of St. Martin are planted with a double row of trees, forming an agreeable promenade in summer; boats are also used on the smooth surface of this fine sheet of water; and in winter, when frozen, it is covered with clouds of skaters darting along in every direction.

Before

Before this fine basin was constructed, the art of *skaiting* was very little known or practised in the French capital. Some young people born in the north, as fond of this exercise as others are of the chafe, used to be reduced to the necessity of skating upon the basins in the Tuilleries, or at the place called La Garre. Many of these, however, not wishing to be confounded with the lowest of the company, contented themselves with remaining spectators. This is now no longer the case; the winter season, so prolific in a variety of diversions, has witnessed this accession of a new one, of which every class are now partakers. No sooner has the north wind begun to set in, than the amateurs of skating find it necessary to consult their thermometers. Even the most circumspect among them seldom wait till the ice is five or six inches thick. It is then that the young and gay of both sexes assemble from all points. The females in their rich furs cautiously venture their trembling feet upon the glassy surface, while the other sex, light as the gossamer, glide across it with the velocity of Eolus. Beneath a tent, a female distributes cakes, brandy, and *cervelats*; while her husband assists the skaiters in putting on their accoutrements.

Another curious winter amusement is recently got up, called *Les Montagnes Russes*, which have been all the rage. These are artificial mountains on which the party slides down in a car with an amazing velocity. It is a favourite amusement in winter on the banks of the Neva; where a timber mountain is constructed, and on its side water, during a keen frost, is poured down, which freezing, forms a slide for the Russian, of which he is amazingly fond. A Frenchman tried this amusement in France: he expended nearly 4000*l.* sterling in making the experiment; it succeeded beyond his most sanguine hopes, and he has realized a fortune of 20,000*l.* by it. This has induced many speculators to invent or construct similar ones. Hence the Illyrian Mountains, the Swiss Mountains, the Falls of Niagara, &c. &c.—In consequence of several accidents having happened, this dangerous amusement was suppressed by the police; but we believe that it has been revived.

FOUNTAINS.—Eighty fountains distribute their pure and gratuitous streams to the numerous inhabitants of this great metropolis. Of these seventeen were constructed by order of Bonaparte; or, as the French would now say, “between the years 1804 and 1812.” The others are ancient. We can describe only a few of the most remarkable.

1. The *Fontaine de Grenelle*, Rue de Grenelle, presents a rich and stately front, though in a very confined situation, and with no exuberance of water. It was built by Bouchardon in 1739; it is of a semicircular form, 90 feet in length, and 36 in height. The City of Paris is represented by a figure sitting on a pedestal; below are two figures emblematic of the Seine and the Marne; all three of white marble. In niches are the Four Seasons. The two spouts of water that issue from this monument are too insignificant for the size of the building.

2. The *Fontaine des Innocens*, is situated in the market of that name, and was erected in 1551, by command of Henry II. from the designs of Jean Goujeon. As this elegant fountain was partly concealed among the adjoining houses, Napoleon had it taken to pieces and reconstructed, carefully preserving, however, the curious bas-reliefs of Goujeon: hence also the letter H and the lilies appear as before, in those parts where N and the eagle might have been expected to have been substituted. The profiles and proportions of this fountain are much admired, as well as the Corinthian elegance of its decorations. It is a perfect square, and rises about ten feet above its basement. Each of its fronts presents an opening with two Corinthian pillars on each side. Upon the pedestal are bas-reliefs; and another above the cornice in the attic crowned by a triangular pediment; and the whole edifice terminates in a cupola covered with sheets of copper formed to resemble the scales of a fish; the height of the whole is 42 feet. Three of the Naiads which have

been added to the bas-reliefs were the work of M. Pajou, in imitation of the one made by Jean Goujeon. At the corners of the lower basement are four lions of lead, from which jets of water are directed into the basins; and yet higher, in the middle of an arch, is another basin, elevated on a pedestal, from the centre of which springs a jet d'eau, and from the side are several little streams. The naiads, water-gods, and tritons, in bas-relief, are remarkable for the gracefulness of their attitudes, the beauty of their forms, their finished execution, and the true antique air of their drapery. Little tablets of black marble bear the inscription, *FONTIUM NYMPHIS; To the Nymphs of the Springs, or Fountains.*

3. *Fontaine du Chatelet.*—In noticing the Egyptian column, which stands in the middle of the Place du Chatelet, p. 601, 2, we omitted to observe, that the column stands in a basin of water, and forms one of the fountains of Paris. The base of the column is composed of a single stone in the centre of the basin. Above that appears the imperial eagle, with a cornucopia on each side terminating in a dolphin's mouth, which spouts out water. Surrounding the foot of the column itself are the statues we have mentioned, which are admirably proportioned, and among them is introduced the Gallic cock. This column is intended to commemorate some of the earlier victories of Bonaparte, the inscriptions being in the following order, beginning from the bottom: *LODI, PYRAMIDES, ULM, DANTZICK.*

4. *Fontaine de l'Ecole de Médecine.*—The form of this fountain is remarkable. It consists of a kind of grotto, formed by four Doric pillars, from the roof of which the water descends like rain, and is received in a semicircular basin at the base.

The *Fontaine St. Eustache*, in the market of that name.—In a niche of a rustic form, surrounded by icicles and incrustations, is placed a vase, whence descends a sheet of water. It is first received in a shell, and thence escapes into a semicircular cistern. Above the shell is placed the head of a Tantalus, crowned with flowers, with his mouth open, and his eyes eagerly fixed on the descending water, which he is utterly unable to reach.

6. The *Fontaine de la Rue Censier.*—A satyr, surrounded by all the attributes of Bacchus, offers the water with an air of derision.

7. The *Fontaine de Popincourt.*—This quarter of the city is industrious, but very poor. The ornaments of the fountain are appropriately chosen: Charity is leading one little child, hiding another in the folds of her robe, and offering the nutritious draught to two others.

8. The *Fontaine de l'Esplanade du Boulevard de Bondi.*—The plan of this immense fountain is simple, and the effect is striking. It is composed of three circular and concentric basins. Four lions pour a stream of water into the uppermost, and thence it pleasingly flows from basin to basin.

9. The *Fontaine de la Place Royale.*—The only thing remarkable in this fountain is, that the water, in issuing from the jets, forms a beautiful fleur-de-lis. The effect is pleasing, and the imitation perfect.

10. The *Fontaine de St. Martin.*—The new fountain on the Boulevard de St. Martin, is the noblest ornament of the kind in Paris, and derives a considerable degree of beauty from its magnitude, its form, its materials, and its decorations. The form is circular, the ornaments are lions, the materials are granite and bronze, and the quantity of water is abundant. The trees which line the Boulevard are a very pleasing accompaniment.

All these fountains were intended to be surpassed by,

11. The *Fontaine de l'Elephant.*—Near the spot on which the Bastille once stood, is erected an arch, on which was to have been placed an immense elephant of bronze, 72 feet high, with a tower on his back, out of whose trunk the water was to have flowed.

The model is complete, and is exhibited near the spot under an immense shed. The stupendous dimensions of the

Fontaine des Innocents.
Engraved for the Encyclopædia Londinensis. May 1821.

the animal may be imagined, when it is mentioned that the staircase to the tower is contained in one of the legs. This undertaking was commenced by order of Bonaparte; but it is probable that the idea will now be relinquished.

Notwithstanding that fountains are so numerous, water for domestic purposes is dear; it is carried about in carts, and sold at a halfpenny a-pailfull. Our convenience of water-pipes under-ground is not known in Paris.

BATHS.—The frequent use of a warm bath is considered by the French as essential to comfort and health. There are baths in almost every part of the town. They consist of ranges of small rooms, each neatly fitted up with a bath, towels, gowns, a fire, and conveniences of every kind. In each bath are two pipes, one for cold and the other for hot water. Every person makes his bath as he pleases; and, if he choose to breakfast, read the papers, or make a morning's lounge in the bath-room, every thing which he can wish is furnished from the house. The charge for the mere use of the bath, the room, and the necessary articles for bathing, is generally 1s. 3d.

On different parts of the Seine are large and elegant house-boats, fitted up as baths in a very complete manner. Each boat, in addition to the baths, contains a kitchen and dining-room. The edge of the boat resembles a little garden, with all sorts of plants, flowers, and trees, birds hanging in cages, and little fountains playing. When lighted up at night, this has a very pleasing effect.

There are also Ecoles de Natation, or swimming-schools, which in the summer are much frequented by the young Parisians. The art of swimming is expeditiously taught, and at a very small expense.

MARKETS and HALLS.—The Markets for provisions, and the Halls for the sale of various articles of merchandise, were formerly mean and badly constructed, in narrow, dark, and dirty, situations, not at all proportioned to the daily increasing extent and population of Paris. Within the last fifteen years, numerous works of this kind were commenced by Bonaparte, which are mostly completed.

La Halle au Bled, the Corn Market.—M. Maizieres constructed this hall in 1562, for the sale of wheat and other corn. It was celebrated for its circular form, the lightness of its arches, the elegance of its architecture, and its pleasing appearance both within and without. This building proving too small, it was resolved to cover the court, although it was no less than 120 feet in diameter. This was accomplished by one immense arch.

Being burnt down in 1802, it has been rebuilt, and covered in such a manner with sheet-copper as to prevent a similar accident; and a large floor under the cupola has been appropriated as a dépôt. The new cupola, justly the theme of universal admiration, and the improvements of this building, cost 800,000 francs. Upon the exterior, and half inserted in one of the walls, is an astronomic column, constructed by order of Catharine de Medicis in 1571; it is 95 feet in height; and at its base is a public fountain, and towards the summit a sun-dial. This market is kept open on Wednesdays and Saturdays for grain, and every day for flour.

Grénier de Réserve, Granary of Reserve.—This immense building was erected in 1807, near the Boulevard Bourdon. It cost more than twelve millions; and is supposed to be capable of containing sufficient corn to supply Paris for six months.

Halle aux Draps, the Cloth Hall, was built in 1786.—The entrance is by a double flight of stairs, and the vast apartments in the interior are lighted by fifty windows. Cloth is sold every day; but linen only occasionally, and then for five days successively, reckoning from the first Monday of each month.

Marché de Vieux Linge, Rag Fair; Rue du Temple.—A multitude of pillars support the four enormous halls of which this immense bazar is composed. It contains 1800 shops, or stalls.

Foire et Depot permanent des Laines, Wool Market.—Vol. XVIII. No. 1259.

This establishment, which began in June 1813, has for its principal object the favouring the progress of one of the most important branches in the rural industry of France, by insuring a ready sale, and setting a certain value upon its productions. Two weekly markets are held here, on Wednesdays and Fridays.

Halle aux Vins, the Wine Hall.—The ancient hall having fallen to utter ruin, Napoleon commanded the first stone of the present magnificent dépôt to be laid in 1811. It is divided into fourteen halls and eighty-one cellars, and will contain 200,000 hogheads of wine. It consists of three large piles of building: the principal of these runs along the Rue St. Victor; but the offices are upon the Quai St. Bernard. All the foreign wine intended for the consumption of Paris is brought to this vast entrepôt.

Halle à la Viande, the Flesh Market; is open on Wednesdays and Saturdays for butchers' meat, and every day for poultry, giblets, &c.

In the *Carreau de la Halle*, near the Rue de la Tonnelerie, from two in the morning till nine, river and sea-fish are sold wholesale. Cheese is sold on Tuesdays, Wednesdays, and Saturdays. Bread is also brought here by country bakers, and butter from Gournay and Isigny. Eggs are sold on Wednesdays and Saturdays.

A new market called the *Marché des Prouvaires*, has lately been opened for the sale of butchers' meat. It is on a large scale, and excellently planned. The pork-market is on Wednesday and Saturday.

Marché à la Volaille, the Poultry Market; Rue des Grands Augustins.—Nothing can be more elegant than this edifice, consisting of four galleries, separated by four ranks of pillars, and forming innumerable arcades. Between the pillars are placed iron railings with numerous gates. The building is 190 feet long, and 141 wide. A fresh assortment of poultry and game usually arrives every Monday, Wednesday, Friday, and Saturday.

Marché St. Joseph, St. Joseph's Market; Rue Montmartre.—This little market was built in 1794, on the site of a chapel dedicated to St. Joseph. Molière and La Fontaine had been buried here; and their remains are now trodden under foot by the venders of poultry and fish.

Marché des Innocens, between les Rues de la Ferronnerie et aux Fers.—Here, in the ninth century, a tower was standing for the purpose of warning Paris of the hostile approach of the Normans. This being destroyed, the place was converted into a burial-ground, and more than half of the population of Paris was interred here. A church dedicated to the Innocents was likewise built. In 1785 this church was demolished; and the putrid exhalations which spread around rendered it necessary to shut up the cemetery, which had long been a scandal and a nuisance to the very centre of the city. It was therefore determined to remove the bones, and to convert the vast expanse into a market for vegetables. In the centre is a beautiful fountain, which has already been described.

Marché aux Fruits, the Fruit-market, Quai de Tourneville.—This market is well supplied every day with such fruits as are in season, most part of which arrive by water.

Marché aux Fleurs, the Flower-market; Quai Desaix.—This is the empire of Flora; and the beautiful coup d'œil which it presents in spring-time, on Wednesdays and Saturdays, about five or six in the morning, is scarcely conceivable. Two fountains here are well adapted for watering these flowers, &c. during the heat of summer; the only works of art that are to be seen among these beauties of nature.

Marché St. Germain; Enclos de la Foire.—On a spot which was once occupied by a multitude of the meanest huts, and which was the resort of the lowest orders of the dissolute and abandoned, an edifice, designed as a market, and which promises to be spacious, elegant, and commodious, was begun in 1813, and is probably completed by this time.

Marché aux Chevaux, the Horse Market; Boulevard de l'Hôpital.—Held on the afternoons of Wednesday and Saturday,

turday, from two till four in winter, and till six in summer. Here a very rigid police is employed to verify the state of the horses, and to prevent any from being sold that are unsound, or have any contagious distemper. A register is kept of all that are sold, and the sellers are made responsible for nine days, in case of the horses proving otherwise than warranted when sold.

Marché des Bœufs, Cattle Market.—Held on Mondays at Sceaux, and on Wednesdays at Poissy, two villages near Paris.

Abattoirs, Slaughter-houses.—The slaughter-houses, which are considered the nuisance and disgrace of the English metropolis, are placed in the outskirts of Paris, and under the inspection of the police. The slaughter-house of Montmartre, at the end of Rue Rochechouart, rivals many of the public buildings in its external appearance. It is no less than 1074 feet in length, and 384 in depth, and is watered by sluices from the Ourcq. On entering it, the stranger perceives no disagreeable smell; he witnesses no disgusting sight; and often he would not suspect the purpose to which the building is devoted. The slaughter-houses of Popincourt, Rue des Amandiers, St. Antoine, and of Vaugirard, between the barriers of Sevres and Paillassons, almost rival that at Montmartre.

The above public establishments of markets and slaughter-houses are well worthy the attention of our own government: the paucity and inconvenience of our markets, and the impropriety and danger of having a large cattle-market and slaughter-houses in the very centre of a great city, have long been felt and acknowledged. Where we do not invent, we should not be too proud to imitate.

GATES.—The Greeks and the Romans, and, before them, the Egyptians and the mighty people of Asia, ever eager to display their taste, their zeal, and their prodigality, in adorning the principal cities of their respective kingdoms, were extremely ingenious in the construction of gates, as may be perceived from the testimony of ancient writers, supported by what still remains of this branch of national magnificence. Indeed the gates were not only the protection of the inhabitants within the walls, and the admiration of strangers without, but also high courts of justice, where the elders, and the kings themselves, used to sit in judgment for the execution of the laws; and the Ottoman court has preserved to this day an undeniable proof of the foregoing assertion, in the truly Asiatic style of "The Sublime Porte." The gates of Athens, of Thebes, of Agrigentum, of Syracuse, &c. were undoubtedly wonderful specimens of architecture; and, when the Romans exchanged the manly penuriousness of their republican liberty for the glorious servitude imposed upon them by their magnificent emperors, then the famous seven-hills began to be approached, not by small apertures, flanked with uncouthly-built towers and *propugnacula*, but by sculptured gates and storied triumphal arches. Those of Titus and Vespasian, looking still so proudly upon the havoc made around them by the rapid and devastating hands of barbarity, and the slow but constantly-working scythe of time, have given, in latter days, origin, through a noble imitation, to the erection of the Parisian gates under the reign of Louis XIV. But, of several which have adorned the capital of the French empire, two only remain; the gate of St. Denis and that of St. Martin. Those of St. Antoine, St. Bernard, la Conférence, and a dozen more, having been many years since levelled with the ground.

Gate of St. Denis.—This majestic and elegant structure, after the design of Blondel, master of mathematics to the Dauphin, son of Louis XIV. is a square of 72 French feet. The bay, or principal entrance, twenty-four feet, is flanked by two pyramids, attached to the work, and ornamented with trophies, in the pedestals of which two small gates are elegantly contrived for foot-passengers.

The name of gate is now improperly given to this edifice; it is truly a triumphal arch. It was erected by the city of Paris in commemoration of the uninterrupted se-

ries of victories which distinguished one period of the reign of Louis XIV. On each side of the arch are pyramids in bas-relief, filled with trophies. The arrangement of the different pieces, and the execution of the whole, will scarcely yield to the celebrated column of Trajan. On the side towards the city, colossal figures of Holland and the Rhine sit at the base of the pyramids, and the pediment over the arch represents the passage of the Rhine. Towards the suburbs, the pyramids rest on lions, and the bas-relief over the arch represents the taking of Maastricht. On both sides we read in golden characters the well-known inscription, *LUDOVICO MAGNO*. The whole was erected between the years 1672 and 1674. The execution was entrusted to the famous sculptor, Gerardon; but the latter part of the work is from the hands of Michel Anguier, a most eminent artist at that time. The top of the building is flat and spacious; and many people who have not much to do, nor much money to spare, by ascending a flight of stairs contrived within one of the limbs of this large body, enjoy, on a fine morning, a fine view over the capital, which is but seldom crowned with fog or smoke.

This monument has been regarded as one of the noblest works of the age of Louis XIV. whether we consider the harmony of its proportions, or the admirable execution of all its parts. Having suffered some injury from time and from the ravages of the Revolution, M. Cellerier was employed to repair it. It does much credit to his taste and his modesty, that he has contented himself with restoring its original inscriptions and sculptures, without one addition or embellishment.

On arriving from Calais, you enter Paris by the Porte St. Denis; and it was by the Porte St. Denis that kings and queens made their public entry. On these occasions the houses in all the streets through which they passed were decorated with silk hangings and tapestry, as far as the cathedral of Notre Dame. Scented waters perfumed the air in the form of jets d'eau, while wine and milk actually were made to flow from different public fountains. On the 3d of May, 1814, when Louis XVIII. made his grand entrée into the capital, the Porte St. Denis presented on each side a shield, with the arms of France supported by two figures of Fame. A crown suspended by garlands, defended from the arch, and on this edifice, as on all others, as well as at the doors of most of the houses, the spotless banner waved, decorated with the emblematic lily.

The *Gate of St. Martin*, is at a short distance from that of St. Denis. It was erected in 1674, as a triumphal arch, after the design of Pierre Bullet, a famous architect of that age, at the northern extremity of the street so called from the convent of Benedictines anciently named *St. Martin des Champs*, St. Martin's in the Fields. It is a square building, as to height and breadth on both fronts, of about fifty French feet, with three apertures like Temple Bar; the middle one being fifteen feet wide and thirty high, and the others eight feet wide and sixteen high. The spaces above the smaller arches are occupied by bas-reliefs, representing, towards the city, the taking of Befançon, and the Triple Alliance; and on the side of the suburb, the taking of Limbourg, and the defeat of the Germans. Above is a pediment, and an inscription extending through the whole of the front.

The gate of St. Martin is inferior to that of St. Denis in richness, but it does not yield to it in harmony of proportion, or delicacy of execution. It is the grand entrance into Paris from all parts of Flanders.

MANUFACTURES AND COMMERCE.

Since the introduction of machinery into France, chiefly by Englishmen, aided by the discoveries of modern chemistry, and a more extensive knowledge of mechanics, MANUFACTURES of all kinds are now carrying on by large capitalists in the spacious premises of the old monasteries. Twenty-one thousand persons are daily occupied at Paris in spinning, carding, and weaving, of wool, silk, and cotton;

cotton; seven thousand are employed in hosiery; and the Parisian manufactory of porcelain rivals that of Sevres. Even the earthenware is more elegant than ever; and alkalis, mineral acids, and salts, are manufactured at a cheap rate. Taffetas, gauzes, and linen, are rendered water-proof, and also impenetrable by the humidity of the air. Richness of colouring, and the most beautiful designs, are also seen in the stained paper for houses. The workmen of the Faubourg St. Antoine give to steel articles almost all the beauty of English polish. The manufacture of cutlery and fire-arms has also improved in the same proportion. The productions of the goldsmiths and jewellers have long maintained considerable credit in Europe; but now, favoured by the progress in the art of designing, and assisted by the finest models of antiquity, the taste, elegance, and richness, of their works, has no precedent. About 3000 workmen in these branches manufacture to the amount of 27 millions of francs. Breguet, Janvier, and Berthoud, still maintain the reputation of the clock and watch makers of Paris; and the optical, mathematical, and musical instruments are made in the best style. A time-piece in France is a much more frequent article of ornamental furniture than in England; and the number of new watches made annually in the kingdom is not less than 300,000; all together, the value of these different kinds of workmanship amounts to 1,500,000. of which more than the half is made in the capital. The works in bronze, belong still more particularly to the capital; and form, in their different branches and stages, of which gilding is the chief, a farther annual value of 1,500,000. sterling. We shall now describe a few of the chief manufactures more particularly.

1. *The Royal Manufactory of the Gobelins.*—This manufactory stands at the southern extremity of Paris, on the margin of the little river Bièvre, so well known from the numerous mills of every description which are set in motion by its current. It was originally founded by one Gobelin, a dyer, from Rheims, who established himself at Paris in the reign of Francis I. He however confined himself to simply dyeing the worsteds. The celebrated Colbert established the grand work, the weaving of tapestry in imitation of that of Flanders; and it is but justice to say, that the tapestry of the Gobelins now infinitely surpasses that of which it was at first an humble imitation.

The principal subjects on which their looms are employed, are copies of the most celebrated paintings of the French and Italian school: and, for brilliancy of colour and delicacy of execution, their productions are often not far inferior to the originals. The simplicity of the machinery, and the grandeur of the building, are well worthy the attention of the inquisitive traveller. A single piece of tapestry sometimes requires the labour of two years, and has cost nearly 3000. sterling; even then the manufacturers are inadequately remunerated for their skill, industry, and expense.

There is a similar manufactory at Beauvais, which is said to rival the parent institution.

At Quai Billy, is a manufactory of carpets, on the same principle, and of very great ingenuity. Both this and the Gobelins are open to the inspection of the public every day, from ten o'clock until one. The productions of these elegant establishments are necessarily confined to the houses of the most opulent classes of society; or rather, in the present impoverished state of France, they are carried on by the government at a loss; and both are now on a reduced scale, the articles being far too costly for private individuals, who are more frequently purchasers of *passementerie*, by which is understood artificial flowers, fringes, gold and silver lace, with a variety of trifling but tasteful articles, all sufficiently adapted to a city where so much more is thought of display than of utility.

2. *Manufactory des Glaces*, Manufactory of Plate Glass; Rue de Reuilly.—In this establishment are polished and perfected those large plates which are formed at St. Gobin,

and Cherbourg. Colbert established this manufactory also; prior to which, plate-glass was only to be procured at Venice; but now the largest sizes are the production of French artificers. In his time, indeed, the manufactory of St. Gobin was confined to blown glass, the greatest size of which did not exceed ten or twelve square feet; but since M. de Nêhou has invented a method of casting the plates, they are sometimes produced ten feet in length and six or seven in breadth, containing sixty or seventy square feet, and valued at 250l. or 300l. sterling. All the curious processes of this manufactory are open gratis to the public; a staircase entirely of glass is among the wonders of the place.

3. *Royal Porcelaine Manufactory*, at Sèvres, near St. Cloud.—The exquisite productions of this establishment are well known. A few of them have found their way to Great Britain, particularly the service of china presented to Lord Liverpool by Bonaparte. In delicacy of execution and brilliancy of colour, except perhaps in a deep rich purple, some of the English manufactories equal that at Sèvres.

A manufactory resembling that at Sèvres, and not a great deal inferior to it, may be seen at M. Dilh's, Rue du Temple. A third establishment belongs to M. Olivier, Rue de Reuilly. It resembles that of Wedgwood, and in some respects equals or even surpasses it. M. Olivier is principally celebrated for his imitation of Etruscan and other ancient vases, and for porcelain figures, which are accurate copies, in miniature, of some of the most exquisite statues of former times.

4. *Manufactory of Crystals*, Rue Montorgueil.—In this place may be seen entire historic subjects, cut on vases, cups, and ewers, of the most elegant forms; and, like the most skilful engraving, a finish is given to the drawing of the naked figure, to the folds of the drapery, and even to the expression of the countenance. The art of engraving on glass has never been carried to a higher degree of perfection.

5. *Manufactory of Painted Papers*, in Rue Louis le Grand.—Two hundred workmen are daily employed in this manufactory, who execute, in the greatest perfection, every ornament resembling painting, sculpture, or architecture. These productions are in much request, for adorning public chambers, galleries, and theatres. The fancy-papers of the most celebrated London makers are greatly inferior to those at Paris.

6. *Manufactory of Arms.*—The finest establishment of this kind in Europe was that of Versailles, where the stranger was much gratified by inspecting the various departments of the manufactory, and the celerity with which the artificers completed the several engines of destructive warfare. It was destroyed by the Prussians on their second occupation of Paris. It is, however, again re-established, but not on its former scale of magnificence.

The Prussians likewise destroyed the manufactory of powder at Essone, and carried off all the machines and implements, some of which were of a new and improved construction.

7. Wine and brandy (not beer) are the chief drink of the French. But there are at Paris a number of establishments very recently formed for the singular purpose of distilling from potatoes a spirituous liquor which (Chaptal, vol. ii. p. 197.) has been generally approved, and has been brought into competition with brandy.

To judge of the activity and industry of the inhabitants of Paris to its full extent, the stranger should visit the Faubourg St. Antoine, l'Enclos de la Trinité, and the quarters of St. Denis and St. Martin; and there he will see the houses from the top to the bottom occupied by a gay patient crowd, continually employed in the fabrication of a number of articles calculated to administer to luxury and frivolity.

Labour in Paris is as much dearer relatively to the provincial towns of France, as labour in London relatively to those of England. It still remains for us to remove from

from our capital some manufactures which have been most injudiciously established there; but the French have carried this false calculation much farther, Paris being the centre not only of ornamental fabrics, such as jewellery, bronze, sculpture, cabinet-making, &c. but of a number of coarser employments, which a very slight change of plan might transfer to a cheaper quarter. There are at Paris periodical exhibitions of French manufacture held once in three or four years; the last (in August 1819) was very brilliant, and honoured by the presence of the king, the princes, the nobility, and all eminent men of science.

The manufacturing industry of France is confined, far more than ours, to the home-market, whether we look to the supply of the raw material, or to the export of the finished articles. Her imports are large only in cotton and silk; in wool and iron they are not considerable; while in flax, hemp, and leather, they may be termed insignificant. In exports the limitation is still more striking; her hardware, her linen, her woollens, her cotton, her leather, and, in a great measure, her silk, being confined to the home-market; a restriction owing partly to our manufacturing superiority, but more to the capital of our merchants, and their ability to give long credit. The productive industry of France is consequently much less subject than ours to sudden fluctuation. It follows nearly the same routine year after year. On the occurrence of a war, or other political change, the commerce and manufactures of our neighbours, to borrow a phrase of Talleyrand, (Letter to Mr. Fox, 1st of April, 1806.) *se relèvent sur eux-mêmes*. Need more be added, to show the error of those who maintain that, half a century ago, her manufactures were of great amount, that they were almost entirely suspended by the revolution, and indebted for their subsequent revival to the exertions of the government. The fluctuations, at no time of great amount, have related chiefly to the export-trade, and owed their origin to the general hostilities of 1793.

Land-carriage in France costs only from 2s. to 2s. 6d. per cwt. for 100 miles; a cheapness which facilitates the transport of merchandise to the various annual fairs which are still held in every great town in the kingdom, exactly as was done by our forefathers a century ago. This periodical routine begins by the Foire de Longchamps, which is held annually at Paris in spring, and is followed by a long list of provincial fairs, of which the chief are those of Beaucaire in Languedoc, and Guibray in Normandy.

The weights and measures of France were reduced, as is well known, to a very simple and uniform scale soon after the revolution; but there has been much difficulty in accustoming the inhabitants, particularly in country-districts, to the adoption of the new system, which unfortunately preserved none of the names with which they were familiar. In 1812, a kind of compromise took place; government sanctioning the retention of the old names, such as pounds, ounces, ells, and bushels; but requiring that their contents should be calculated by a reference to the decimal standard. It is, accordingly, on this footing that business is now transacted in France.

COMMERCE.—The chief commercial business of Paris is necessarily inland; but it is the centre of exchange transactions for France, foreign as well as inland; as London is for England, and Amsterdam for Holland. The principal business of Paris is carried on by forty respectable banking-houses, and about seven hundred and forty-five mercantile firms. Fifty-four agents of the Exchange take upon themselves the negotiation of public and private business; they alone regulate the course of exchange, the discount upon bills, &c. Every open day at change, they are to be found there from two to four; and every week a chamber of fifteen of the most respectable merchants in point of opulence and character, assemble at the Hotel de Ville, to prepare for government their views and observations upon the means for augmenting the prof-

perity of commerce, &c. For the adjustment of disputes among people in trade, a court is chosen consisting of a president, eight judges, and sixteen *suppléans*; and here some of the principal bankers and merchants are not above giving their attendance.

We shall conclude this section with noticing three literary societies which have been established at Paris for the benefit of agriculture and commerce.

1. The *Bureau des Longitudes*, or Committee of Longitude; at the Observatory, in the Faubourg of St. James.—The labours of the learned men who compose this society have for their object constant astronomical observations at the Observatory, and in the Military School; and for this purpose they have at their disposal all the instruments of which government is possessed. They correspond with other observatories in France and abroad. They are charged with the publication of the "*Connaissance des Temps*," for the use of astronomers and navigators, and with bringing to perfection the discovery of the longitude, and the most scientific way of making and recording astronomical and meteorological observations, &c. The bureau is composed of two geometricians, four astronomers, with four assistants, two retired naval officers, a geographer, and three artists.

2. The *Société d'Encouragement*, or Royal Society for the Encouragement of National Industry; Rue du Bac.—This society, which has not existed more than twenty years, comprises most of the ministers of state, many public functionaries, the first men of property, and the most celebrated literary characters. Its object is to second the efforts of government, for the improvement of French manufactures, agriculture, and industry. At an annual meeting in July numerous prizes are distributed. The more private meetings of the society are held on every alternate Wednesday.

3. The *Agricultural Society*, at the Hotel de Ville.—It is composed of fifty resident members, thirty French, and twenty foreign associates. It is the centre of correspondence for all the agricultural societies in the kingdom; and is occupied, under the superintendence of the minister of the interior, with every thing relative to the improvement of agriculture. It holds its sittings on the first and third Wednesday in every month. The king is the patron, and the comte de Neufchateau president.

INTERESTING OBJECTS IN THE ENVIRONS.

The BOULEVARDS, or Malls.—The Boulevard's were formerly the boundaries of Paris; but, as that city gradually extended itself on every side, parts of them were at length found in the very centre of the population. They consist of a road, or rather of a superb street, as wide as Portland Place, with a row of elms on each side. This road extends through the whole of the city, and nearly round it, forming a circumference of almost seven miles. Little of the national luxuriance of the elms is pruned; and, arching over head, they form a pleasing shade. Some of the walks are carefully gravelled for the accommodation of foot-passengers; and on each side of the malls is an uninterrupted succession of noble mansions, splendid hotels, cafés, restaurateurs, theatres, shops, booths, tea-gardens, flower-gardens, and fountains.

The Boulevards on the north, which are called the Old or Great Boulevards, were begun in 1536, and intended to serve as fortifications against the English, who were ravaging Picardy, and threatening the capital: hence the name *boulevard*, which signifies a bulwark. As the walks were extended, they were soon covered with turf, and were much resorted to for playing at bowls; hence another derivation of the name, *bouler au vert*, to bowl upon the green, or, in short, a bowling-green.

The Great or North Boulevards were first planted about the year 1660; the trees have therefore attained a majestic size. Some of those on the south side of the river were not completed till 1761; but the walks are wider, and the trees more luxuriant.

The

The principal charm of the Boulevards consists in the gay and festive crowd which constantly fills them, and the inexhaustible fund of amusement which every step supplies. From noon until night they are the favourite resort of the Parisians of every description. In the heat of the day, and the early part of the evening, the walks are lined with a double or treble row of chairs, occupied by various groups, reading, chatting, drinking, smoking, or gazing on the pedestrians. The Parisian *petit-maitre* is always to be seen here, carelessly lolling with his legs on one chair, while a second supports his body, and his arm is, with studied negligence, thrown over a third. The chairs are hired at a *sous* each.

At the side of the malls is a motley and indescribable group, which contributes not a little to the amusement and interest of the scene. Ballad-singers, dancing-children, and dancing-dogs, tumblers, posture-masters, conjurors, puppet-showmen, merry-andrews, players, and fortune-tellers, stand in long and interminable succession; each unweariedly exerting himself to please, and thankful for the few *sous* which are occasionally thrown to him. Trades and commodities seem all to have deserted the houses. Not only birds in cages, and flowers and trees in pots, but the choicest prints and books, articles of dress and furniture, add their hues and their interests to the groups. *Bureaux des écrivains* (letter-writers) offer the most pressing invitations to the lover, the merchant, the politician, or the man of science, who has by some accident omitted to learn to write, to enter and avail himself of the talents which are in readiness for any employment. Roasted chestnuts every-where tempt the palate, by assailing the nostrils. Flower-girls, that will take no denial, push nosegays into your hand. The fruit-women extend towards you delicious bunches of grapes; the shoe-blacks flatter the national prejudices of the English, by bawling aloud *Cirage Anglois!* A man carries a painted castle on his back, from which you may draw such delicious beverage as lemonade, tisane, &c. Add to these, musicians performing on every instrument which the art of man has invented to please or torture the ear; professors of natural philosophy, who contrive to make their hydrostatic experiments sufficiently impressive on the visages and clothes of their auditors; the sage diviners of the lucky numbers of lottery-tickets; men with castles inhabited by white mice, who play a thousand antics in the different apartments; fortresses, guarded by a regiment of canary-birds, who perform their different evolutions with the precision of veterans; and last, not least, caricaturists, or *grimaciers*, who change the human face divine into a rapid succession of odd and inconceivably-grotesque forms, which no risible muscles can possibly withstand.

Towards night the crowd increases, and almost the whole extent of the Northern Boulevards, from that of the Capuchins to St. Antoine, forms one closely-wedged moving mass. Dancing now commences in the booths, and the gardens by the side of the walks; every angle and nook of the Boulevards, on which the crowd does not press, is occupied by a group lightly tripping to the music of some guitar or violin. The stalls are tastefully, if not splendidly, lighted up. Each candidate for public favour displays his lamp or his candle, and redoubles his efforts to attract attention. The face of every passenger is clothed with smiles; the Parisian has forgotten the vexations and fatigues of the day, and abandons himself to the dominion of pleasure. No city in Europe habitually presents so lively and amusing a spectacle. It is only exceeded at Naples or at Venice, and then only in carnival-time.

The Southern Boulevards are not so much frequented, and will be visited by the stranger when he wishes for a pleasant and more solitary walk.

The animating features of the Boulevards, always interesting, were strikingly so, in the summer of 1815, after the celebrated battle of Waterloo. "Parties of Russian

cuirassiers, Prussian lancers, and Hungarian hussars; Cossacks old and young, from the grey-beard to the beardless boy, cantering along after their singular fashion, their long lances poised on their stirrups, and loosely fastened to their right arms, vibrating over their heads; long files of Russian and Prussian foragers, and long trains of Austrian baggage-waggons, winding slowly through the crowd; idle soldiers of all services, French as well as allied, lounging about in their loose great-coats and trowsers, with long crooked pipes hanging from their mouths; patrols of infantry parading about under arms, composed half of Russian grenadiers, and half of Parisian national guards. Russian coaches and four, answering to the description of Dr. Clarke, the postillions riding on the off-horses, and dressed almost like beggars; Russian carts drawn by four horses abreast, and driven by peasants in the national costume; Polish Jews, with long black beards, dressed in black robes like the cassocks of English clergymen, with broad leathern belts; all mingled with the Parisian multitude upon the Boulevards; and, in the midst of this indiscriminate assemblage, all the business and all the amusements of Paris went on with increased alacrity and fearless confidence." *Travels in France*, vol. i. p. 19.

Although the environs of Paris do not afford that variety of magnificence to be found in the vicinity of our own metropolis, yet there are many objects well worthy of attention, whose parallel would be in vain sought for in the neighbourhood of London, or, indeed, of any other city in the world. The most interesting part of the suburbs of Paris, and that which deserves especially to be visited, is the road through the Tuileries, and Champs Elysées, to the Bois de Boulogne, about three or four miles distant. The suburb of Montmartre partakes of the magnificent; and an afternoon or two will be agreeably spent in the Champ de Mars, and its vicinity.

BOULOGNE.—The village of Boulogne, about six miles from Paris, was well known in the annals of superstition. Certain pilgrims, on their return from a holy journey to the chapel of Our Lady at the seaport of the same name, founded a religious house here, and gave the present village, then called *Mêmes le St. Cloud*, the appellation which it now bears. It is from this village that the adjoining forest derives its name, being formerly called the Forest of Rouvnet.

The name of the *Bois de Boulogne* would lead the traveller to expect lofty trees and luxuriant foliage; but much of the fine wood which once adorned it is destroyed, and it is now merely an extensive copse, thinly scattered with young plants.

An annual procession, called the *Promenade de Long Champ*, draws together the Parisians of every rank. In former times, nuns from the neighbouring convent went in grand procession through the wood. It is now nothing but a long string of coaches, carts, cabriolets, and horsemen. Every one puts on all his finery, and seems determined to be gay and merry.

This wood is frequently the scene of the royal hunt; and to the English sportsman a more tame and ludicrous business can scarcely be conceived. The park is sufficiently enclosed on every side to prevent the possibility of the escape of the animal from its narrow limits; it has innumerable avenues of trees, and in every principal avenue a person is placed to watch the direction which the deer takes, and communicate the intelligence to the royal hunters. The sport, therefore, consists in galloping up and down these walks, without the possibility of a leap in a run of many a mile. When the Prussians pitched their tents on this spot in 1815, they destroyed much of the timber for fire-wood.

The wood, or park, is a fashionable morning-ride for the dandies: it is, in short the *Parisian Hyde Park*, in which the fashionable equestrian, upon his Norman hunter,

With heel insidiously aside,
Provokes the canter which he seems to chide.

The villa of *Bagatelle* stands on the borders of the Bois de Boulogne, and near the banks of the Seine. It was built by Bellanger, whose designs unite at once grandeur and grace. Three court-yards lead to the pavilion, from the innermost of which a flight of steps conducts to the grand entrance, splendidly embellished with columns. The saloon is ornamented with exquisite bas-reliefs, and other specimens of art in the Italian style. On the left of this apartment is the bathing-room, fitted up in the most tasteful manner, and decorated with several large paintings from the pencil of Robert. The second apartment is a boudoir, embellished with six pictures by Collet. The mansion also contains a handsome billiard-room. The furniture of the sleeping-apartment is completely *en militaire*, consisting of trophies, and every attribute connected with war. The inscription on the portal gives the true character of the place; *Parva, sed apta*. The different windows present the most enchanting views in every direction, comprising the windings of the Seine, the abbey of Longchamp, the bridge of Neuilly, and the Valerian Mount. The garden always delights by the variety and beauty of the objects which it presents. Temples, grottos, bufs, are scattered with tasteful profusion; and nothing is wanting to complete the beauty of the scene.

Bagatelle, which was the property of the count d'Artois, suffered during the reign of revolutionary fury; but it has since been restored to all its original perfection, and is again become the property of its ancient possessor.

Two deserted and now half-demolished royal mansions, are situated in the Bois de Boulogne; the *Chateau of La Muette*, a favourite residence of Louis XV. and *Madrid*, built by Francis I. soon after his return from captivity in Spain.

Passy.—This delightful village is situated upon an eminence on the banks of the Seine, between Paris and the Bois de Boulogne. It is esteemed for its mineral waters, the salubrity of its air, and the most charming views in every direction. In this village are many handsome houses, one of which was the residence of the celebrated Dr. Franklin after his return from America. At the extremity of Passy is a spacious esplanade covered with turf, whence the view of several fine structures presents a most agreeable contrast with the wavy verdure of the Bois de Boulogne, which in this direction assumes a very picturesque appearance.

Anteuil, a little to the south of Passy, dates its origin from very remote antiquity, and was formerly celebrated for the excellence of its wines. If it has, however, lately lost much of its reputation on this score, it will never be deprived of the fame which it derives from having been the retreat of numerous persons eminent for their talents and their virtues; among whom may be reckoned the satirist Boileau, the learned Helvetius, the inimitable La Fontaine, the witty Molière, and the tragedian Racine. In the church-yard is a pleasing monument to the chancellor d'Aguesseau.

MALMAISON.—Directly west from the Bois de Boulogne, and about nine miles from Paris, on the road to St. Germain-en-Laye, stands the chateau of Malmaison, celebrated as having been long the residence of the emperor Napoleon, and afterwards of the empress Josephine. It had a gallery filled with some of the finest paintings and sculpture in France, and a most beautiful English garden. But Malmaison in 1815 was delivered up to the savage fury of the Prussians, who, assisted by British bayonets, destroyed pictures, statues, plants, &c. and made this terrestrial paradise a scene of ruin and destruction.

The abbé Delille has immortalized the rivulet of Malmaison. It is not, however, the stream which flows through the gardens that employed his pen, but a little rivulet winding through a long avenue of spreading chestnut-trees.

MARLY.—About a mile farther west is the village of Marly. At the foot of a superb cascade, and below the most delightful gardens, formerly stood a sumptuous cha-

teau, the residence of Louis XIV. It was demolished during the reign of revolutionary fury. On its site now stands a cotton-mill. The park and gardens, however, still retain much of their original beauty, and will not disappoint the traveller's expectation.

The principal curiosity of the place is the machine of Marly, to supply Marly and Versailles with water from the Seine. It was constructed by Renneguin Sualem. It raises the water to the astonishing height of 600 feet, and discharges nearly 30,000 hogheads in twenty-four hours. See the article *MARLY*, vol. xiv. p. 384.

The chateau of *Luciennes*, near the machine of Marly, was built by Le Doux, in three months, for the residence of Madame du Barry. The delightful prospect which the place affords, the talents of the architect, the sculptures, the paintings, and decorations, all united to make Luciennes a model of magnificence, elegance, and beauty. Since the Revolution, however, almost every moveable has been sold, the bas-reliefs have been mutilated, the fine cornices broken, and the hand of anarchy has left its destructive traces on every work of art. The entrance presents a peristyle of four pillars with niches, in which are marble statues and a bas-relief representing a group of Bacchanalian Children. From the sumptuous saloon the eye is gratified by the view of an extensive tract of country. On the left is St. Germain, on the right Paris, and in front Vevinch and St. Denis, with the river Seine in all its delightful meanderings.

Setting out again from Boulogne, we soon reach the village and palace of

St. Cloud.—This place derives its name from very remote antiquity. Clodoald, or St. Cloud, grandson of Clovis, having escaped when his brothers were murdered, retired to this place to avoid the persecution of his uncles, and founded a monastery at the village of Nogent, now called from him St. Cloud.

The palace of St. Cloud is justly celebrated for its beautiful prospect, its gardens, its park, its cascades, and the master-pieces of painting and sculpture which it contains. It stands on a steep declivity overhanging the Seine, and commands an extensive prospect of mingled wildness and beauty. The situation is picturesque and romantic, and worthy of becoming the favourite residence of the monarchs of France.

The entrance to the palace is by an extensive court, composed of a great range of buildings, and a façade 144 feet in length, and 72 in height. Two pavilions at the extremity form the commencement of two wings less elevated. The ascent to the state apartments is by the grand staircase to the left, the pillars and balustrades of which are composed of the choicest marble.

The ex-emperor preferred this place of residence to every other, and decorated it with all that inventive luxury was capable of producing; for it was in the halls of this palace that the directory was annihilated, and himself chosen consul, and here he properly commenced his wonderful career: and here also he may be said to have ended it, if indeed it be ended; for here the second capitulation of Paris was signed, (of which we shall in another part of this article speak more particularly,) which blasted his schemes of aggrandisement, and devoted him to imprisonment on the rock of St. Helena.

It would be difficult to convey any idea of the unparalleled splendour of the interior of this palace: gold, velvet, the most costly stuffs richly draped, adorn the walls, together with looking-glasses of prodigious dimensions, works in bronze, and master-pieces in every branch of the imitative arts ancient and modern. Guérin's celebrated Phædra hangs in the apartment where Bonaparte held his council; the arm-chair here, completely covered with carving and gilding, in which he used to sit, is also a great curiosity. All the embellishments on both the arms are cut and scratched to pieces; for that restless spirit, which was continually impelling him to the work of destruction, allowed him even here not a moment of repose;

repose; he kept hacking away incessantly at the chair with his pen-knife, so that he broke one almost every day. By his command the most exquisite productions of art were brought alternately from the grand magazine of plunder, the Louvre, to St. Cloud, that he might enjoy them exclusively. All the apartments were by him adorned with a magnificence becoming a royal residence. The empress Maria Louisa's chamber is a fairy-palace, and her boudoir the cabinet of the Graces.

The *gardens* are universally admired. Nature and Art combine to render them highly picturesque and beautiful. Antique and modern statues, temples, altars, sheets of water, groves, and parterres of flowers, are tastefully arranged in every direction; while an extensive and pleasing landscape opens to the view, and the whole city of Paris displays itself, intersected by the Seine, whose innumerable windings give peculiar interest to the prospect. The most striking object is the cascade. It is divided into two parts. The upper cascade is 108 feet wide, and the same in height. Its head is decorated by sculptures of a river-god, and a naiad, representing the Seine and the Marne. The sheets of water which proceed from them unite as they fall into a great shell in the centre, whence flow nine other sheets, which, in their descent into a large basin, assume many fantastic forms. An alley divides the upper from the lower cascade. Three distinct sheets of water here fall into a circular basin, thence into a second and a third, and lastly into a canal ornamented with a variety of jets. In the intervals between the cascade are enormous leaden figures, representing dolphins, frogs, &c. which spout large quantities of water to an immense distance. In one place a number of jets intersect each other in a pleasing manner, and on the right a single jet rises to the height of 97 feet.

St. Cloud is much frequented, especially on Sundays. An auberge at the foot of the bridge affords rest and refreshment. The annual fête is on the three first Sundays after the 7th of September. The gardens are then filled with booths of every description, and the whole population of Paris crowds to a scene at all times delightful, and now enlivened by joy and festivity.

Leaving St. Cloud, and walking through the park, the visitor will arrive at a gate exactly opposite the celebrated porcelain-manufactory of Sevres, which has been already noticed. We are then on the road which leads directly to

VERSAILLES.—This enchanting place, which in the time of Louis XVI. contained near 100,000 persons, was formerly but an inconsiderable village. It is about twelve miles from Paris; and the road leading to it is perhaps the finest and most elegant in the world.

The *palace* is the first object which naturally attracts the curiosity of a traveller. It is built on an elevated site, and displays on all sides a gorgeous and massy pile. The following is the account given of its origin. Louis XIII. purchased the land of John de Soissy in 1627, and erected upon it an uncouth hunting-seat, part of which still exists; but Louis XIV. was the founder of that magnificent piece of architecture, which has always excited the admiration of foreigners. Delighted with the position of the chateau, he collected together a number of skilful artists, and converted the village into a city, and the hunting-seat into a vast palace, which united every thing that was most exquisite in art and taste to splendour and magnificence. The work commenced in 1673; and the buildings of the park and gardens were completed in 1680, during the ministry of the great Colbert. The artists employed were Mansard for the architecture and management of the erections; André le Nôtre for the arrangement and decoration of the gardens; and Charles le Brun, for the departments of painting, design, and the arts dependent on them.

The *stables*, which were planned by Mansard, were commenced in 1679, and completed in 1685; they are remarkable for the regularity of their structure, and are relieved by some good pieces of sculpture. The buildings will contain from 4 to 5000 horses.

After having traversed the Place d'Armes, you enter the first court, called the Court of the Ministers. From this court you next enter that of the Palace, the right wing of which was rebuilt on a new plan. This court is terminated by the Marble Court, so called because it was paved with squares of coloured marble. On its lateral angles are two arcades, one of which leads to the south, and the other to the north, terrace. From the latter side is a vestibule decorated in the Ionic order, with a ceiling in compartments which leads to the chapel, the opera-house, and the theatre. On the right of the vestibule, in the space between the pillars, is a bas-relief of the celebrated Puget, representing Alexander in the presence of Diogenes. This piece of sculpture is considered as a chef-d'œuvre. We next proceed along the north terrace, in order to view the extent of the palace and its decorations. It is above 800 feet in length, and is composed of a ground-floor, a first story, and an attic, ornamented with Ionic pilasters, and crowned at the summit with vases and trophies.

The first apartment, the Saloon of Hercules, the admiration of foreigners, and the glory of the French school, is sixty-four feet in length and fifty-four broad, superbly decorated, and enriched with a painted ceiling, representing Olympus and all the heathen deities, and the apotheosis and labours of Hercules. The second apartment is the Hall of Plenty, in which are several paintings. From this apartment you enter the Hall of Diana; the ceiling of which is painted, and represents the Moon, under the figure of Diana, on a car drawn by two flags, and accompanied by the Hours, and the attributes of the Chase and of Navigation. In the fourth apartment, which is called the Hall of Mars, Audran has painted on the ceiling this deity in his car, surrounded by all his martial attributes; and Jouvenet and Houasse have likewise executed four paintings analogous to this subject. The next apartment is the Hall of Mercury, with a ceiling painted by Champagne, after the designs of Le Brun, representing this heathen divinity on his car, surrounded by his characteristic attributes. This room possesses many pictures. The hall of Apollo comes next, with a ceiling which represents the God of Day seated in his car, with all his attributes. Adjoining to the grand gallery is the Saloon of War, the ceiling of which is by Le Brun, and its subject Bellona and her attributes.

In no part of Europe is there any apartment to be compared with the Grand Gallery of Versailles, either for taste, arrangement, or magnificence. The architecture and paintings were designed by Le Brun. It is 222 feet in length, 30 in breadth, and 37 in height, and contains seventeen large windows; opposite which are as many arcades with glasses within that reflect the gardens and their water-pieces, and all the objects in the gallery. Between the arcades and the windows are forty-eight pilasters of rance-marble, the bases and composite capitals of which are of bronze gilt. The centre of the dome represents, by symbolical figures and allegories, in nine large and eighteen smaller paintings, the most remarkable epochs of the reign of Louis XIV. from the year 1661 to 1678; such as the conquests of Holland and Franche-Comté, the passage of the Rhine, &c. There are inscriptions which mark the subject and the year. These different pieces are distributed into compartments of a beautiful architecture. The genii of the Arts and Sciences are occupied in decorating the place with carpets and garlands. The cornice is ornamented with trophies, to which infants are hanging flowers. Two grand arcades, ornamented with four columns and eight pilasters, embellish the entrance into this superb gallery; the pilasters are separated by pedestals en faillie, supporting vases.

The gallery is terminated by the Saloon of Peace, which formed a part of the apartments of Marie Antoinette, and is of the same shape and dimensions as the Saloon of War. It contains a painting of Le Brun, in which France is represented seated on an azure globe, in a car borne on a cloud,

cloud, and crowned by Glory. Peace and the Loves join together several turtle-doves bearing on their necks medallions, symbols of the alliances which occurred during the reign of Louis XIV. The ornaments in relief are of gilded bronze. Beyond this saloon two other apartments complete this grand and magnificent suite.

The *opera-house* is a grand structure, though much fallen to decay: it no doubt once combined taste with splendour; the orchestra is large enough to contain eighty musicians.

The *chapel* of the palace was finished in the year 1710, and is a superb monument of the munificence of Louis XIV. The grand altar-piece is composed entirely of scarce marble, and decorated with a Glory, with angels worshipping on each side; the whole in bronze, gilt. This chapel has been preserved with great care from the havoc of the revolution, and has moreover been repaired and beautified very recently.

The *park and gardens* next claim our attention. The palace is surrounded towards the west by three inclosures; the last of which, called the Great Park, is about thirty miles in circumference. The circuit of the Little Park comprises several farms; and this property and Trianon are inclosed at the two extremities of the two arms of the canal, while the centre is cut by a large quantity of handsome avenues, with four rows of trees. The most noble entrance into the park is by the great stairs of the green-house, but the shortest course is from the grand terrace by the lateral arcades of the palace. When the water-works play, the coup d'œil is exquisite; and a traveller will therefore endeavour to pay his visit at that time: they are set playing about once a month, and the time may be known by application at Paris. By placing yourself on the middle of the parterre, by the water-piece, you see in front, beneath the two combats of beasts, the basons of Latona, of Apollo, and the canal; to the right, the parterre of the north, called the Parterre of Flowers, the Fountain of the Pyramid, the Cascade, a sheet of water terminated by the Bason of the Dragon, and by the great piece of Neptune, to the left, the parterre and the green-house. Various parts of the gardens are ornamented with groves, groups, antique statues, baths, vases, basons, and fountains, in marble, bronze, or metal gilt. The principal groves are the rock or bath of Apollo, the colonnade, the domes, and the three fountains.

Among the various groups which are scattered about the gardens, there are two by Puget, in which the skill of the artist has been pre-eminently distinguished; these are, Milo of Crotona, and Perseus delivering Andromeda. The great piece of Neptune is a vast and magnificent bason of water, ornamented with five groups, and twenty-two great vases of bronzed metal. The principal groups represent Neptune and Amphitrite, Proteus, and the Ocean. The green-house and hot-house are very good buildings. The parterre, decorated with a large piece of water and two marble vases, is surrounded with a considerable number of orange-trees, several of which are as old as the time of Francis I. The hot-house is constructed with great simplicity, and consists of a gallery lighted by twelve arched and two oblique windows, which communicate with the one at the top. Opposite to the green-house, and beyond the Little Park, is a large bason, 2100 feet in length, and 730 in breadth, called the *Pièce des Suisses*, at the extremity of which is an equestrian statue representing Quintus Curtius devoting himself for his country. The canal is about 4800 feet in length and 192 wide; the two branches, each of which is 1530 feet long, join on one side Great Trianon, and on the other the Menagerie.

There are many objects worthy of attention at Versailles besides the palace. Among these may be named the public official buildings, the theatre, public baths, and a superb manufactory of arms. Volumes indeed have been written upon the subject, with engravings of various parts of the palace, the stables, the gardens, water-works, &c.

Trianon—is within the enclosure of the park of Versailles, on the right of the great canal; and was built by Mansard, at the command of Louis XIV. on the spot where the village of Trianon formerly stood. The front is 384 feet in length. Between the windows are elegant pilasters of Languedoc marble, of the Ionic order. Two wings are terminated by two pavilions, which are united by a peristyle, composed of twenty-two columns of red marble. The roof, in the Roman style, is surrounded by balustrades, ornamented with vases and groups of little Cupids.

The interior of the palace corresponds with its exterior embellishments. The gallery and billiard-room contain some exquisite views of the scenery of the gardens and park. The gardens form the principal charm: they are tasteful and luxuriant beyond description. Every beautiful shrub and flower of every climate blooms here: it is in truth a fairy scene. It used to be said of the three principal gardens planted by Louis XIV. that Versailles was the garden of waters; Marly the garden of trees; but Trianon the garden of flowers.

Little Trianon.—This small palace, situated at one of the extremities of the park of Great Trianon, consists of a pavilion, in the Roman style, forming a complete square. Each front measures about eighty feet in length, consisting of two stories above the ground-floor. Each front exhibits a different specimen of architecture. The whole is decorated with the Corinthian order, and crowned with a fine balustrade; the columns and pilasters being fluted from the top to the bottom. The most delicate and finished taste is observable in the construction of this edifice, which was built by Gabriel, at the command of Louis XV. The several suites of apartments display a corresponding grandeur. The pleasure-grounds consist of gardens, laid out in the English and French taste; being diversified with statues, orangeries, a musical saloon, grottoes, temples, cottages, cascades, and canals. The gardens are now, however, going to decay. The little Temple of Love, among artificial rocks, and embowered amid the thickest trees, has been pillaged. The cottages are dilapidated, and the lake is almost dry.

This little palace was the favourite resort of the unfortunate Marie Antoinette.

Saint Cyr.—This village, situated about three miles from Versailles, was long celebrated for an institution, established by Louis XIV. under the title of the Royal Society of St. Cyr, for the education of the female nobility. Its first abbess was the famous Mad. Maintenon, who there ended her days. This institution was abolished of course at the Revolution, and the building appropriated to the reception of wounded soldiers. It has since been converted into a school of public instruction.

Turning to the south-east, and again approaching the Seine, we come to the palace, or castle, of

Bellevue,—which was built by the orders, and under the direction, of Mad. de Pompadour, mistress of Louis XV. This chef d'œuvre of architecture, to embellish which all the celebrated artists of the time united their talents, was completed in the short space of two years. The park and garden are highly and fancifully ornamented. Nothing can be grander than the prospect from the northern terrace. The view of Paris, of the Bois de Boulogne, and of the Seine, which winds in a thousand directions, and forms as many canals, has very properly bestowed on this delightful spot the name of *Bellevue*.

Bellevue was inhabited by the aunts of the late unfortunate monarch, and shortly after their departure from France it was transformed into a prison. The furniture and all the exquisite works of art were wantonly defaced or destroyed, or sold. The saloon alone escaped the general destruction, being used by the commanding officer of the day as his apartment.

RUELLE.—This is a large village seven miles west of Paris, situated at the foot of a delightful hill, and containing 3000 inhabitants. The chateau and park are very magnificent,

magnificent, and the barracks are some of the noblest in the vicinity of Paris.

ISSY is a village situated on a little hill about three miles west from Paris, and not far from the Seine. It derives its name from an ancient temple dedicated to Isis, no vestige of which now remains, unless some Roman building in the cellars of the seminary of St. Sulpice may be considered as part of it. The ancient palace of Childbert yet stands on an eminence opposite to the church, and is an interesting gothic structure. Here the admirable actresses Madlle. Clairon resided, and was often visited by the most celebrated characters of the times. It was here that the cardinal de Noailles, Bossuet, Fenelon, and Tronson, assembled, to hold those meetings known under the name of the "Conferences of Issy."

MEUDON.—About three miles south-west from Issy stands the village of Meudon, dating its origin from the earliest period of antiquity. The palace stands upon an eminence commanding an extensive view of Paris and its environs. The stranger arrives at the edifice by a very fine avenue, at the end of which is a superb terrace, serving as a court-yard to the building, which was originally erected by the cardinal de Lorraine, in the sixteenth century, after the designs of Philibert de Larma. When Mons. de Louvois became the possessor of Meudon, he employed Mansard to superintend the formation of the terraces and moats, and the grand entrance.

The front of the palace presents a most majestic coup d'œil. It is ornamented with arcades and pilasters. The centre pavilion, which is rounded off at the extremities, projects from the main façade of the edifice, and is adorned with a second order of pilasters and bas-reliefs, representing the four seasons. The whole terminates with a pediment, upon which are two recumbent statues, and an octagonal vaulting which supports a terrace. The apartments of this palace are numerous, and decorated in the most sumptuous manner; while the gardens, which were embellished by Le Nôtre, are laid out in the very best style of that celebrated French gardener. Delille has immortalized them in his beautiful poems. The view from the terrace is one of the most interesting in the neighbourhood of Paris.

CHATILLON is charmingly situated one mile south-east of Meudon. The prospect, although not very extensive, is pleasingly diversified, presenting the course of the Seine, Mount Valerian, Vincennes, the heights of Montmartre, and the city of Paris. It is crowded with chateaux.

BAGNEUX, a little more to the east, is pleasantly situated on a plain overlooking the road to Orleans, four miles from Paris. It contains numerous chateaux, the most superb of which belong to Messrs. Bailly and Cordier. About a mile to the north is

ARCEUIL, about three miles from Paris, on the little river Bièvre, where is a magnificent aqueduct, the architecture of which may be compared with the finest specimens that Italy can afford. Mary de Medicis caused this fabric to be built after the designs of Jacques Desbrosses, to convey the waters of Runges for the use of the inhabitants of Paris. The aqueduct consists of twenty arches. It is 400 yards in length, and 24 in height. A spring in the neighbourhood of Arcueil has the property of depositing a stony crust on small bodies immersed in it. Little pieces of wood, apples, and peaches, are frequently thrown into it, which in a short time assume the appearance of pleasing petrifications.

GENTILLY, about a mile north of Arcueil, on the banks of the river Bièvre, only a mile from the barrier of Italy, is one of the most ancient villages about Paris. The kings of the first dynasty had a palace here; and the beautiful Diana of Poitiers long inhabited a chateau in the neighbourhood. These royal residences are now no more; but numerous country-houses are seen, and the guinguettes are crowded on every festival.

On the road from Paris to Gentilly, are the ruins of

an ancient aqueduct, which is said to have been erected by the emperor Julian to convey water to his Palace of Thermes, situated in the Rue de la Harpe, at Paris.

Turning now again to the south, we come to IVRY, at an equal distance from Bagneux and Arceuil. It is sometimes called Mont Ivry, being on the summit of one of the little hills that enrich the left bank of the Seine. It is crowded with country-seats; the most elegant of which belongs to comte Jaubert. The annual fête is on the first Sunday in May.

BOURG LA REINE is two miles south of Ivry, on the road to Orleans. Henry IV. had a palace here, to which he retired as often as he could escape from the cares of government. This palace is now a seminary for the education of young ladies. The room in which the monarch used principally to reside is still shown.

SCEAUX is just below Bourg la Reine. It formerly contained a magnificent castle, belonging to the duke of Penthievre, the very ruins of which have almost disappeared. Part of the garden remains, and is a favourite promenade of the Parisians. The market, by which Paris is principally supplied with cattle, is held here every Monday. On every Sunday, from the 1st of May to the 1st of November, the park and garden are crowded by the middle and lower classes of the Parisians. Dancing commences in the evening, in a spacious rotunda, and is continued until a late hour.

RUNGES is more directly south, being eight miles from Paris on the road to Fontainebleau; and is principally remarkable as the source of the waters which the aqueduct of Arcueil conveys to Paris.

CHARENTON is more to the north-east, and two leagues from Paris, on the road to Troyes. It contains an institution for lunatics, to the number sometimes of 400. An ancient castle in Charenton once belonged to the celebrated Gabrielle d'Estrées. Most of the chateaux afford a pleasing prospect of the surrounding country.

VITRY.—This pleasant village is three miles south of Charenton, on the road to Choisy. It contains numerous country-seats, and is surrounded by extensive nurseries for fruit-trees and flowering shrubs. Its annual fête is on Whitsunday.

CHOISY LE ROI—is about three miles south of Vitry, still on the banks of the Seine. It is defended by hills from the scorching winds of the south. The air is remarkably salubrious, and the view is agreeable and picturesque. It contains more than three hundred elegant houses, built in the same style of simple architecture.

A magnificent palace formerly decorated Choisy, which, after passing into the possession of several of the noblesse, was purchased by Louis XV. It was occasionally visited by Mad. de Pompadour, accompanied by her royal lover. Of this sublime structure and its beautiful gardens not a vestige now remains: but manufactories of earthenware, Spanish leather, and mineral acids, occupy its site. The fair or fête is at the end of August, and is superior to most in the neighbourhood of Paris. Boats go to Choisy from the bridge of the Garden of Plants; and stages from the Porte St. Antoine.

Turning now north-east, and crossing two arms of the Seine, we come to

St. MAUR, which is only a short league from Paris, in a peninsula formed by the river Marne. It is celebrated in history on account of the massacre of the Christians by the troops of Attila. The witty and licentious Rabelais here composed his Pantagruel. In this place the Brothers of the Passion first performed their mysteries. The chateau was built by Catherine de Medicis. The front towards the garden still retains its ancient architecture; but the rest of the palace is modern, and decorated in the most sumptuous manner; while the gardens, which were embellished by the famous Le Nôtre, are laid out in a style that confers honour upon his acknowledged talents. A canal has been commenced here to shorten the navigation

of the Marne. The tunnel, through a hill more than half a mile in length, is almost completed.

BRIE SUR MARNE—is beautifully situated on the summit of a little hill on the banks of the Marne, nine miles directly east from Paris. The principal chateau is an elegant building. The park is extensive, and affords some extremely-picturesque views. To the west of this is

NOGENT SUR MARNE, a large village agreeably situated on the summit of one of the little hills that border the Marne, six miles from Paris. A little more to the west is

VINCENNES.—This village is four miles and a half from Paris. It is of the remotest antiquity, and was inhabited by many of the early kings and queens of France. The palace, which was erected by Francis I. had the appearance, and possessed all the advantages, of a fortress; particularly that part denominated the Dungeon. In this fabric Charles V. expired; and here, in 1422, the warlike Henry V. of England breathed his last; nor is there a building more connected with curious ancient historical incident than the chateau now under review. Of more recent date, may be seen the apartments wherein was confined the prince of Condé in 1617, and, forty years after, the great Condé his son. Cardinal Mazarine also expired at Vincennes, in 1661; nor should the name of the celebrated Mirabeau be omitted, who was imprisoned four years within the walls of this building; during which period he wrote the admirable Letters between Gabriel and Sophia. In one of the moats of this castle the Duke d'Enghien was murdered.

The park, called the Bois de Vincennes, contains about 2000 acres. It was enclosed, in 1183, by Philippe Auguste, to contain the animals presented to him by the king of England, Henry III. It is regularly planted in long walks. There is an oak under which St. Louis used to administer justice; and in the grand walk is a place where cannon is proved.

Vincennes has an annual fête, or fair, on the 15th of August; and Paris pours forth all its population to partake of the amusements of the day. The lovers of archery have then a grand trial of skill.

FONTENAY is a village on the skirts of a wood, and hence called Fontenay aux Bois. It is six miles from Paris, which metropolis is supplied with the greater part of its roses and other flowers from the neighbourhood of this village. In the latter months of spring the country round Fontenay is completely covered with flowers.

PUTEAUX is five miles east of Paris. The neighbourhood of the village also is one uninterrupted garden, delightful both to the eye and smell: it is celebrated for its early vegetables and asparagus. Some beautiful chateaux adorn the banks and islands of the Seine.

SURENNE is a large village, six miles east of Paris, situated on the declivity of a hill, on the banks of the Seine. The festival of the Rosière is held here, on the first Sunday after the fête of St. Louis.

BELLEVILLE.—This village is at no great distance from the barriers of Paris, and its delightful situation has doubtless conferred upon it the name which it bears. Belleville is erected upon an eminence which commands a noble view of Paris. The descent of the hill is decorated with pretty country seats, built in a style of simple but elegant architecture, each possessing a terrace, whence the eye wanders over an immense tract of country, studded with hamlets and villages. On the south-east the gloomy towers of Vincennes rise above the forest, and on the west the spires of Paris are occasionally discerned through the openings of the wood.

Not far distant is *St. Gervais*, one of the most beautiful country walks in the world. Strangers should walk here on Sunday, to see the motley and joyous crowd which the city then pours out.

NOISY LE SEC, is beautifully situated on an eminence, five miles eastward of Paris. It contains a great number of agreeable chateaux.

To the north-east, and on the road to Meaux, we come to the village and forest of

BONDI—two leagues from Paris. It has many pleasant houses. The road is prettily studded with the country residences of the Parisian merchants. Chilperic was assassinated in the neighbouring forest; and many marvellous and tragical tales of the atrocities committed in this neighbourhood are related by the peasants.

LIVRY is a village at the eastern end of the Forest of Bondi, and about twelve miles from Paris. The chateau was once a place of strength and importance. Louis le Gros besieged it in the wars which he carried on against the count of Champagne. He mounted to the assault himself, and was wounded in the thigh by a pike: this redoubled the ardour of the besiegers, and the place was taken and dismantled. Malherbes and Mad. de Sévigny inhabited Livry. It was under its delightful shades that this amiable woman composed those Letters to her Daughter, which are a model of elegance and delicacy.

A little to the south-west of Livry, and nearer to the village of Bondi, but in what is called the Road to Strasbourg, we find the ruins of the once celebrated chateau de

RINCI.—The late duke of Orleans was the proprietor of Rincy, and had taken great pains to arrange his park and gardens in the English taste. Since his death it has fallen to decay; but it still retains its former reputation, and the Parisians frequent it on a Sunday, as our Londoners regale themselves at Richmond or at Hampton Court.

Rinci boasts of extraordinary beauties in the rural scenery, and has many curiosities in the palace. The face of the country is in this part more agreeable, and the fields are in a better state of cultivation, than along the western districts through which the traveller passes. On the left are vast plains sown with corn, the extremities of which are skirted with pretty villages; on the right a ridge of hills, occasionally tufted with trees, rises within half a mile of the road, and the verdure of the intervening fields denotes that the occupations of the dairy-farm are successfully prosecuted in this part of the vicinity of Paris. Indeed, there is a great appearance of cleanliness, neatness, and comfort, in all the villages through which you pass.

The arrangement of the grounds resembles an English gentleman's park. Like most of the seats of the former French princes and nobles, it has of course felt the effects of the revolution; but enough remains to indicate that it was once a most voluptuous spot. The chateau has been demolished, and the massy pillars lie broken and dispersed upon the ground. Opposite to the lodge, on a gentle ascent, stand the stables in a tolerably good state of preservation. The gravel-walks are also in good order; and the aqueducts and basins of water on the higher ground are in a complete state. It is also not a little remarkable, that the trees and copses have not been cut down. The magnificent dairy has been untouched; and at the top of the hill, which overlooks the whole park, the company amuse themselves with wandering in a labyrinth, and surveying the different jets d'eau which are continually playing. From every elevated site in these grounds there are beautiful prospects; some confined, and others ranging over a vast tract of country, but all agreeably diversified.

We now turn to the left, and join Paris on the north.

MONTMARTRE—stands on a hill at a short distance north of Paris. Its name was probably derived from a temple dedicated to *Mars*, the remains of which were to be seen here two centuries ago. Many persons, however, trace its name to the *martyrdom* of St. Denis, which took place here. It is remarkable for its limestone quarries, and the windmills which crown the top of the hill. The inhabitants of Paris often climb this hill to admire the distinct and complete view which it affords of their city. Montmartre contains many pleasant country-houses, and numerous guinguettes.

CLICHY LA GARENNE, so called to distinguish it from another Clichy, which is close to Livry, is a pretty village about two miles from Montmartre, and lying between the right bank of the Seine and the road to St. Denis. The ancient kings of France often resided here. Dagobert held a solemn council in his palace at Clichy.

St. OUVEN SUR SEINE is a little farther north. Should the traveller pass through this village, which is about five miles from Paris, he will acknowledge that, although it is situated on a plain, the number of chateaux, the pleasing views of the river which they command, and the picturesque arrangement of the gardens, render it one of the most inviting retreats for the rich merchants and citizens of Paris. On the 24th of August a fair is held here, which continues three days, and is much frequented. About a mile farther north, and a little to the east, is

St. DENIS, which derives its name from the cathedral so called, dedicated to the patron-saint of France. A noble Christian lady named Catullis, caused a chapel to be built near the spot on which the present church stands, wherein she deposited the remains of the martyred Dionysius, the apostle of Gaul, and his companions, which she had purchased from the executioner. The chapel was successively enriched by Clotaire, Chilperic, Dagobert, and numerous ancient monarchs, until it arrived at the acmé of its greatness.

The town contains about 5000 inhabitants. The church of St. Denis is the king's chapel royal. The west front has three old Saxon arches; one of the west towers has a spire, but there is no middle tower. The vaults under the choir were the burial-place of the kings of France for about a thousand years; but at the Revolution, in September 1792, the mob broke open the tombs, burnt the coffins of lead and wood, and scattered the royal bones about the church-yard; the church was also ransacked, and the organ destroyed, as well as the altars and chapels. Bonaparte, though he did not pay much respect to the remains of the royal family, yet was ambitious of being buried in the same place from which their bones had been removed. He accordingly prepared a vault for himself and his dynasty; the entrance to which was to be by two immense massy bronze doors, with three locks and keys: the keys to be kept by three of his favourite generals. Louis XVIII. has been employed in repairing the chapel, and restoring things as far as possible; 100,000 francs per annum (between 4 and 5000 pounds sterling) have been appropriated for this purpose ever since the Restoration. The whole interior of the church, which is much in the style of Amiens, and nearly as handsome, has been thoroughly cleaned, and the windows put in perfect order. It is now useable for service; and the workmen are renewing all the ornamental parts of the pillars. The vaults below, which are in the Saxon style, are very light and cheerful, having several windows to the open air. They are also lofty and extensive. All the scattered bones have been carefully collected, and placed in a distant part of the vaults, which is walled up; and there is a large plate in front of it, on which, in letters of gold, are inscribed the names of at least fifty or sixty kings, queens, dauphins, and princes, to whom the bones belonged, with a statement of the fact of their having been disinterred in September 1792, and re-buried in 1817. The remains of Louis XVI. and Antoniette, which had been privately interred, were removed with great pomp to the church of St. Denis, and are placed in a distinct vault. The stone coffins of king Pepin, Louis VIII. and two or three others of the old kings, have been found, though without any bones: they were identified, and are to be preserved. About twelve or fourteen old tombs of kings remain entire: statues of these kings, as large as life, something in the style of those in Yorkminster, but recumbent on the monuments, are also perfect, and have been cleaned. The black coffin of the prince of Condé, who died in 1818, is in a distinct vault, but is shown through a grated door;

and a new vault is made for the royal family. The sacristy or vestry is a handsome room, and is adorned with paintings, representing the coronations of several kings, and other historical subjects. The great bell, in the key of G, has a remarkably rich tone. Near the west end is the monument of king Dagobert, who is regarded as the founder of the church. It is adorned with imagery in three compartments, representing a legendary story. In the first, he dies; and the devils, enraged at his having built a church, seize him, and put him into a boat to carry him to sea. But in the second, the priests come to his assistance, throw the devils overboard, and rescue the king; and, thirdly, angels carry him to heaven.

Arnouville is a league from St. Denis, on the bank of the little river Cran. The park, which contains about 300 acres, is beautifully diversified with groves, lawns, cascades, and sheets of water. The appearance of the village is much admired. All the streets centre in a spacious lawn ornamented by a noble fountain.

Stains.—This village is north-east of St. Denis. The chateau of M. de Livry is worth visiting, not only on account of its pleasant situation, although the country round it is comparatively flat, but for an extensive collection of aquatic birds, and the rarest and most beautiful species of deer.

Pierrefitte is one mile north of Stains, on the road to Beauvais. It is situated on the declivity of a small hill, and contains the chateau of M. Faucompret de Vieuxbanc, celebrated for its valuable collection of rare and beautiful plants.

Ecouen la Hautefeuille is a village about six miles north of St. Denis. A chateau was built here by Anne of Montmorency, which, on the emigration of the noble family of the Condés, became national property. The seminary for the education of the daughters of the members of the Legion of Honour (see p. 469.) has, we understand, been removed to this place. The painted glass in one of the galleries has been much admired. The subject is taken from a work of Raphael, and represents the history of Psyche. The chapel and the sacristy offer some well-executed copies of Raphael and Leonardo da Vinci.

Passing through a wood nearly two miles long, and traversing Luzarches and a few more villages, we at length reach

CHANTILLY, which is twenty-two miles north of Paris. —This town was once famed for the beauty of its gardens, the splendour of its palace, and still more for the heroes who inhabited it. The hunting-seat of the Montmorencies and the Condés is now a heap of ruins. It was destroyed by a mob from Paris early in the Revolution. The stables only remain; and these, even in their dilapidated state, convey no mean idea of the former magnificence of the place. The building consists of one enormous stable, 600 feet in length, and 40 in height. In the centre is a lofty dome, 90 feet high, and 60 in diameter. Under this is a fountain which supplies a noble reservoir formed of the most costly marbles, and enriched by numerous well-executed decorations. This unique apartment was formerly divided into 400 stalls, but they have been long ago demolished.

The inhabitants of Vineuil, a village exactly opposite to the place where the palace formerly stood, resolved to shoot the wild beasts in the menagerie, as agents in the conspiracy of Condé to starve the people. But they were apprehensive that these animals might make a sally, and wage a war of extermination against them; upon which considerations, feeling their courage to be unequal to the shock of a pitched battle, they determined in solemn council to call in the revolutionary army as their auxiliaries. As soon as their allies arrived, and had stationed a couple of pieces of artillery on the neighbouring height, a general action commenced. A heavy fire was opened on the imprisoned sovereigns of the forest. After a breach had been effected, the drums beat a general charge;

charge; the centre of the revolutionary army advanced to the charge, bayonets fixed, while the right and left wings kept up a smart fire of musketry upon the invincible enemy. The inhabitants of Vineuil were in the rear. At length the revolutionary army entered the breach, and the whole garrison was put to the sword.

When the splendid palace of the Montmorencys was levelled with the ground, a smaller chateau connected with it was spared. This is now the habitation of the duke de Bourbon, to whom the patrimony of his ancestors has been restored. It contains nothing to arrest the traveller's attention, unless the melancholy contrast which its hasty and coarse repairs form with the vestiges of former princely grandeur.

Having gone farther north than we intended, we turn west by south till we come to

MONTMORENCY, a little village ten miles north from Paris, placed on an eminence which gives it an extensive prospect and a salubrious air. All that remains of the magnificence of the dukes of Montmorency is found in the church, which affords a perfect specimen of Gothic architecture. Montmorency was the residence of J. J. Rousseau. It is much frequented by the Parisians on every festival.

Epinay sur Seine is a village pleasantly situated about three miles south-west from Montmorency. The kings of the first dynasty had a country residence here. Dagobert died in the palace; the remains of which are scarcely visible. Among the numerous chateaux, that of comte Lacépède is the most beautiful.—Still *beuding our way* to the south-west for about six miles, we reach

COURBEVOIE, a village containing many pleasant country-seats, and a magnificent barrack for the royal guard. It is situated on one of those delightful eminences which diversify the left bank of the Seine, and is about four miles from Paris, on the road to St. Germain's.

NANTERRE is a little more to the south-west, and seven miles from Paris, on the road to St. Germain's. It is celebrated for its excellent sausages and cakes; but more so as the birth-place of the humble shepherds who became the patron saint of Paris.—Turning now directly east, we approach the north-west entrance to the city of Paris at

PONT DE NEUILLY.—This village, situated upon the banks of the Seine, has acquired much celebrity on account of its magnificent bridge, delightful gardens, and the interesting views which it commands. In 1606 there was only a ferry at this village; but an event which nearly terminated the lives of Henry IV. and his suite, led to the construction of the bridge. The monarch was returning from St. Germain's with his queen, and several of his nobles. On approaching the river, the horses, frightened by a thunder-storm, precipitated themselves into the water, dragging the vehicle into the deepest part; and, had not the most timely assistance been given, that great king and his companions must inevitably have perished. The bridge which was built upon this occasion lasted only thirty-five years; after which period the present superb structure was planned and executed, being 750 feet long, and composed of five arches, each 120 feet wide, and 30 feet in height. It was erected after the design of Peronnet. It was opened with great ceremony in 1772, in presence of a vast concourse of people, and Louis XV. was the first who drove over it in his carriage. This spot has to boast of many noble houses, which belong to the opulent and fashionable inhabitants of the French metropolis. The numerous little streams which descend from the hill contribute much to the embellishment of the gardens. The annual fête is on the 24th of June.

Nanterre, Courbevoe, and Neuilly, are all near the Bois de Boulogne, whence we set out at p. 493. so that we have now completed our circuit, with the omission of many interesting places which are or will be noticed in their respective parts of the alphabet. If some of the

more distant objects, as Rinci for instance, be visited on a Sunday, the traveller, both in going and returning, will be serenaded with music in every village, and highly diverted with the amusements of the peasants. They are now seen dancing by moonlight on the green, and at another time in a large room lighted for the purpose. They are all neatly dressed in their Sunday clothes, and seem to enjoy their sports. Not a single village but has its rural ball; and along the road, at different distances, are rooms lighted up, in which suppers are preparing for the dancers. These rooms being interspersed among the trees, give to the whole a very interesting appearance. Such scenes as these pourtray, in lively colours, the innocent gaiety and good-natured mirth of the country people in France, and forcibly exemplify the beautiful description of the sweetest of poets:

Gay sprightly land of mirth and social ease,
Pleas'd with thyself, whom all the world can please;
Alike all ages. Dames of ancient days
Have led their children through the mirthful maze;
And the gay grandfire, skill'd in gestic lore,
Has frisk'd beneath the burden of threescore.

POLITICAL HISTORY from THE YEAR 1814.

We left Napoleon, after his first abdication, at Elba, on the 4th of May, 1814. See the article LONDON, vol. xiii. p. 392.

The terms upon which he was permitted to retire sufficiently proved either his own remaining consequence in the opinion of the allies, or the powerful intercession that had been made in his favour. Indeed, subsequent events have proved, that his partisans were both numerous and powerful, and that the army was entirely devoted to him. As the treaty is of peculiar importance, we shall here lay before our readers the principal articles of it.

TREATY between the ALLIED POWERS and his Majesty the EMPEROR NAPOLEON.

Art. I. His Majesty the Emperor Napoleon renounces for himself, his successors and descendants, as well as for all the members of his family, all right of sovereignty and dominion, as well to the French empire and the kingdom of Italy, as over every other country.

II. Their Majesties, the Emperor Napoleon and the Empress Maria Louisa, shall retain their titles and rank, to be enjoyed during their lives. The mother, the brothers, sisters, nephews, and nieces, of the emperor, shall also retain, wherever they may reside, the titles of princes of his family.

III. The Isle of Elba, adopted by his majesty the Emperor Napoleon as the place of his residence, shall form, during his life, a separate principality, which shall be possessed by him in full sovereignty and property; there shall be besides granted, in full property, to the Emperor Napoleon, an annual revenue of 2,000,000 francs, in rent-charge, in the Great Book of France, of which 1,000,000 shall be in reversion to the empress.

IV. The duchies of Parma, Placencia, and Guastalla, shall be granted, in full property and sovereignty, to her majesty the Empress Maria Louisa; they shall pass to her son, and to the descendants in the right line. The prince her son shall, from henceforth, take the title of Prince of Parma, Placencia, and Guastalla.

V. All the powers engage to employ their good offices to cause to be respected, by the Barbary powers, the flag and the territory of the Isle of Elba, for which purpose the relations with the Barbary powers shall be assimilated to those with France.

VI. There shall be reserved in the territories hereby renounced to his majesty the Emperor Napoleon, for himself and his family, domains or rent-charges in the Great Book of France, producing a revenue, clear of all deductions and charges, of 2,500,000 francs. These domains or rents shall belong in full property, and to be disposed of

of as they shall think fit, to the princes and princesses of his family; and shall be divided amongst them in such a manner that the revenue of each shall be in the following proportions, viz:

	Francs.
To Madame Mere - - - - -	300,000
To King Joseph and his Queen - - - - -	500,000
To King Louis - - - - -	200,000
To the Queen Hortense and her children - - - - -	400,000
To King Jerome and his Queen - - - - -	500,000
To the Princess Eliza - - - - -	300,000
To the Princess Paulina - - - - -	300,000
	2,500,000

The princes and princesses of the house of the Emperor Napoleon shall, besides, retain their property, moveable and immoveable, of whatever nature it may be, which they shall possess by individual and public right, and the rents of which they shall enjoy (also as individuals.)

VII. The annual pension of the Empress Josephine shall be reduced to 1,000,000, in domains, or in inscriptions in the Great Book of France; which she shall continue to enjoy in full property, moveable and immoveable, with power to dispose of it conformably to the French laws.

VIII. There shall be granted to Prince Eugene, Viceroy of Italy, a suitable establishment out of France.

IX. The property which his majesty the Emperor Napoleon possesses in France, either as extraordinary domain or as private domain attached to the crown, and which his majesty abandons to the crown, shall be reserved as a capital, which shall not exceed 2,000,000, to be expended in gratifications in favour of such persons, whose names shall be contained in a list to be signed by the Emperor Napoleon, and which shall be transmitted to the French government.

X. All the crown-diamonds shall remain in France.

XI. His majesty the Emperor Napoleon shall return to the treasury, and to the other public chests, all the sums and effects that shall have been taken out by his orders, with the exception of what has been appropriated from the civil list.

XII. The debts of the household of his majesty the Emperor Napoleon, such as they were on the day of the signature of the present treaty, shall be immediately discharged out of the arrears due by the public treasury to the civil list, according to a list which shall be signed by a commissioner appointed for that purpose.

XVI. There shall be furnished a corvette and the necessary transport-vessels to convey to the place of his destination his majesty the Emperor Napoleon and his household: and the corvette shall belong, in full property, to his majesty the emperor.

XVII. The emperor Napoleon shall be allowed to take with him, and retain as his guard, 400 men, volunteers, as well officers as sub-officers and soldiers.

XVIII. No Frenchman who shall have followed the Emperor Napoleon or his family, shall be held to have forfeited his rights as such by not returning to France within three years; at least they shall not be comprised in the exceptions which the French government reserves to itself to grant after the expiration of that term.

XX. The high allied powers guarantee the execution of all the articles of the present treaty, and engage to obtain that it shall be adopted and guaranteed by France.

XXI. The present act shall be ratified, and the ratifications exchanged at Paris, within two days, or sooner if possible. Done at Paris, the 11th of April, 1814.

The Prince De METTERNICH.

J. F. Comte De STADION.

ANDRE' Comte De RASOUMOFFSKY.

CHARLES ROBERT Comte De NESSELRODE.

CHAS. AUG. Baron De HARDENBERG.

Marshal NEY.

CAULINCOURT.

After the allied powers had signed this treaty, they applied to the British government for their accession to it; but this was refused, except merely as far as regarded the arrangements for securing the duchies of Parma, &c. to Maria-Louisa and her son, in perpetuity, and the Isle of Elba to Bonaparte for life; to these articles alone the signature of lord Castlereagh was affixed.

The definitive treaty between France and the allies, consequent on the preliminary treaty (see LONDON, p. 395.) was signed at Paris on the 30th of May 1814. The Congress, which was expected to be held in London, (see as above,) was, however, held at Vienna; and was still fitting, when, suddenly and unexpectedly, Napoleon again appeared in France.

It has been seen (p. 384 of the article referred to above), that the abdication of Napoleon was absolute and unconditional, "for himself and his heirs." Upon this point his empress addressed the following Protest to the Congress. That paper was thought little of at the time, and its authenticity was doubted by many; but, since it was formally received by the Congress, and entered among their Acts, we shall insert it entire, because we think it may at some future time be referred to as a document of great importance.

PROTEST of the Empress MARIA LOUISA against the Occupation of the THRONE of FRANCE by the Dynasty of the BOURBONS.

"Maria Louisa, Empress, Archduchess of Austria, Duchess of Parma, in our name, during the minority of our beloved son and sovereign, and in the name of our son, Charles Francis Napoleon, as legitimate possessor of the Imperial Throne of France.

"The distance at which we are kept from our hereditary states, and the absence of the members of our government, preventing us from claiming the admission of a minister to represent us at the Congress now assembled at Vienna, and the desire of giving full authenticity to our reclamation in behalf of our beloved sovereign and son, have induced us, in imitation of our immortal ancestor of glorious memory, Maria Theresa, to take the resolution of laying before the above-mentioned Congress, a declaration of the rights of our beloved son to the crown of France, and a development of the principles on which they are founded; to the end that it be known to Europe and the French nation, that it has never been our intention willingly to renounce the imperial throne of France, on which it pleased Divine Providence to place us.

"We will not here recall to mind the disasters which deprived the House of Bourbon of the French throne. We will rather throw a veil over the errors of princes, and the faults of nations. We will not defend the work of factious and revolutionary proceedings; but, we will declare, that there exists a public law of immutable nature, which binds nations to princes, a law of policy, containing the principles upon which sovereigns ought to conciliate their rights and interests with certain rights and liberties which are the property of their subjects.

"A series of fatal events put an end to royalty in France. All Europe took up arms to sustain or restore a throne which its possessor was unable to maintain; a throne which had sunk into nought through the flight of the princes and nobility which were its natural supporters, and perhaps through the violent cause of a popular will unrestrained in its manifestation. The unfortunate Louis XVI. and his son, perished successively. Their legitimate heirs forfeited their claims to the crown by their free egress from the kingdom, and their retreat into an enemy's country. The Nation, no longer bound to its legitimate princes, was restored to its natural right of election. The other nations of Europe considered these disasters as the work of political fanaticism, and a spirit of rebellion. They in consequence took up arms, and penetrated into

the heart of France. Their success, however, was but of short duration: France soon expelled them from her invaded territory, and maintained her independence. The powers of Europe must then have observed, that, whatever had originally led to this result, the government of France was changed *de facto* and *de jure*, and that it belonged to the French people to institute such form of government for themselves as was best suited to the circumstances of the times.

"In this state of things, every tie was dissolved between France and the Bourbons; between the Bourbons and the other sovereigns of Europe. The family-compact, the treaty of personal guarantee, was cancelled by the influence of circumstances: in a political sense, the Bourbons were no more. The independence of France, under the new government of her choice, was then acknowledged by the very powers who at present compose this Congress. On the 5th April, 1795, the Treaty of Bâle was signed between France and Prussia: on the 22d July, same year, another Treaty was signed at Bâle, between Republican France and Spain. The latter power, on the 7th June in the following year, concluded a Treaty of Alliance with the Executive Directory. The Courts of Sardinia and Naples signed, in the course of that same year, the first on the 15th May, the other on the 10th October, a Treaty with that same Republican Government. The Pope, the minor states of Germany and Italy, solemnly acknowledged also the new government of France. Austria signed the Treaty of Campo Formio with the Directory, and that of Luneville with the First Consul. England, by the Treaty of Amiens, 1st Oct. 1801, Spain by that of 27th March, 1802, Russia by that of 8th Oct. 1808, acknowledged successively the Consular Government, which proclaimed a General Peace on the 18th Brumaire, 10th year of the Republic.

"The act which raised the altars again, and gave peace to the Gallican Church, which brought back morality, checked false doctrines, and substituted the true belief in their lieu; the Concordat, in a word, of which the beneficial effects will long be felt by religion, put the seal, as it were, to those transactions of state-policy, by which a government different from that of the ancient monarchy was solemnly recognised by all Europe. Who at that time suspected the princes of the House of Bourbon of entertaining rights of sovereignty over France? That which has perished, can it rise again? If these princes had no legal rights then, what rights can they have now? The French people unquestionably enjoyed the plenitude of their rights under the Consular Government; at that period, when, to give greater stability to institutions which had put an end to the evils of the Revolution, and to give to Europe a pledge of that stability, the French people bestowed on the First Consul, Bonaparte, the consular power for life. The new organization of the state, in harmony with the genius of its first magistrate, was consolidating itself daily, and it would have accomplished the most sanguine wishes of the French people, were not the life of man limited to a small number of years. To impress these new institutions with a fresh character of permanency, to make them correspond with the governments of the other states of Europe, the Nation substituted for the Consular Power the Imperial Power, which it rendered hereditary in the family of Napoleon Bonaparte. The citizens of the towns, the communes, and the smallest hamlets, covered with their names the registers, wherein the question of the erection of the Empire, and of the election of Napoleon Bonaparte, was submitted to them. He was elected and proclaimed with acclamations. He received the oath of allegiance from his subjects. The temples resounded with thanksgivings from the People to the Divinity. The clergy, in the holy office of the mass, prayed for his person and for his family; and soon the venerable Chief of Christendom came, in person to consecrate, in the Metropolitan Church, a power which

the Emperor Napoleon had till then only held from the hands of the people.

"What was then wanting to the legitimacy of his Crown? Had he not received it from God and his country? In other terms, from *divine right* and from *national right*?

"Europe adopted these principles, and Napoleon assumed the rank assigned to him among sovereigns, by the extent and power of his empire. Austria acknowledged the Emperor Napoleon on the 26th December, 1805, by the Treaty of Presburg. The sovereigns of Bavaria and Wurtemberg were his allies; the same treaty raised them to the Royal Dignity. On the 11th December, 1807, the Elector of Saxony received, by virtue of the Treaty of Posen, concluded with Napoleon, the title of King. Did Europe dispute the legitimacy of these titles, emanated from the Imperial Power and from France? Prussia acknowledged the French Empire and the Emperor Napoleon, by the Treaty of Tilsit, July 9, 1807. The Emperor of Russia preserved his army, amounting to about 200,000 men, by virtue of this same treaty, which acknowledged, not only the French Empire and the Emperor Napoleon, but also the existence as Kings of the Princes of the Imperial Family. Finally, the treaties of 14th of October 1809, and 6th January 1810, between Sweden and France, complete the acts of external policy, which consolidate the dynasty thus seated on the throne of France. All continental Europe, indeed, was the ally of the Emperor Napoleon.

"The family-alliances of the Emperor Napoleon with the most august sovereign houses, tended to consolidate the social compact as established in France. His strongly cemented institutions ensured the stability of the monarchical form of government he had restored; they opposed an invincible barrier to the invasion of the democratic system. The Revolution of France has taught nations to look too closely into what passes in the Cabinets of Princes.

"It was under the guarantee of the Constitution of the French Empire, under that of the treaties and of the alliances of foreign sovereigns, that I became the consort of Napoleon. It was under those same guarantees that Prince Charles-Francis-Napoleon, born of our union, grounds his claim to the French throne, which claim the princes assembled at this Congress have so often acknowledged to be legitimate.

"A fatal war broke out. The Emperor Napoleon was overcome. You, sovereigns assembled in Congress, arrived in his capital at a moment when, favoured by disorder, a conspiracy manifested itself in favour of the princes of the House of Bourbon. You might have dictated to Napoleon in his capital such terms as were calculated to restore a due balance between powers; and you would thus have consolidated institutions, whence arose the common strength and the common safety. This treaty would have been faithfully observed; we have a full confidence thereof. Influenced by a generous hope of putting a speedier end to the evils of war, and of sparing the effusion of blood, you put aside the rights of the Emperor Napoleon; you treated with those princes to whom the conspiracy had given the crown. What lustre could such princes shed upon royalty? The Emperor Napoleon at the head of an army, not numerous, but brave and faithful, might have defended his crown; but to spare his subjects a civil war, he had already resolved to abdicate *in favour of his son*. Such was his determination manifested to the Allied Powers by the Dukes of Tarentum, Vicenza, and the Prince de la Moskowa; which determination those powers viewed at first in its right light, that is, as calculated to secure the tranquillity of Europe. Events, which it belongs not to us to characterize, caused those just resolutions to be revoked. The Emperor was obliged to sign an *unconditional abdication* on the 11th of April, 1814; on that same day he subscribed the

the Treaty of personal safety, which maintaining his title of Emperor, assigned to him the Island of Elba as his place of abode, and confirmed to him the sovereignty over its territory. The 5th article of the same Treaty assigned to me the sovereignty of the states of Parma, transmissible to my son and his descendants.

"I will not discuss the merits of these treaties in respect of the Emperor Napoleon. They are more or less binding on him, in proportion as he exercised his will more or less freely in signing them. We will simply say, that he had not the power of disposing, after his life, of the crown which his son received as his birth-right from the French nation and its constitutional laws. If the sovereigns of France, no more than the other principal sovereigns of Europe, have never been able to break through the established rule of succession in their own families so as to transmit their crown to their second or third son, to the prejudice of their first born, how comes it that the Emperor Napoleon should be able to deprive the Prince Charles-Francis-Napoleon of his right of inheritance, in order to transfer it into foreign hands? Can a conspiracy have destroyed, by its irregular acts, the force and virtue of the laws of the French empire? Can it have destroyed the royalty which the prince, my son, holds of divine as well as national right? The princes whom this conspiracy has put upon the throne of my son, fully admitted these principles themselves, when they refused to acknowledge the acts of the government, styled provisional. Ten years of free-government, acknowledged by all the powers in Europe, at a time when the name of Bonaparte was not yet inscribed in the annals of war; fifteen years existence of an empire, the social conventions of which establish the rights of the Emperor Napoleon, and those of his dynasty; rendered indisputable the legitimacy of his crown.

"When, during my residence at Blois, I exercised the authority of Regent, I appealed to the devotion of Frenchmen; I received the strongest testimonies of their love and zeal for the cause of their legitimate Prince. The presence of your armies, and the tendency of your policy, forbade me to respond to the wishes of that faithful nation.

"The fate of nations being submitted to your award, your object will no doubt be to conciliate their rights and wishes with the rights and interests of sovereigns. Circumstances have deprived my son of his sovereignty over the French Nation, and both himself and his People are equally injured in their rights by this fatal result of the late course of events. In this state of things, we, in our quality of Emperors and of Mother, and before any authentic resolution be taken by the Congress, protest, by the present deed, against all acts of the existing government of France, which has been established to the prejudice of the legitimate heir to the throne. We protest, likewise, in our own name, as well as in that of the Prince Charles-Francis-Napoleon, Presumptive Heir to, and possessor by right of, the French Crown, against all resolutions of the High Powers assembled at Congress, whether taken collectively or individually, and tending to impair the rights of the prince my son to the said French crown.

"The throne of the Prince Charles-Francis-Napoleon is that raised by the French Nation, such as it existed at the time when its choice and election called the Emperor Napoleon to the head of its government. But if, in the arduous struggle in which it has been engaged, the French Empire has been constrained by the force of arms to sign the Treaty of Paris, we think it just, inasmuch as respects the territories not forming part of present France, that the conditions thereof be faithfully and for ever observed. To this end we here declare, that the present Protest solely applies to the illegal occupation of that territory of France constituting the present monarchy.

"Having thus developed her claims, the Empress Maria-Louisa, Archduchess of Austria, Duchess of Parma,

&c. representing the Prince Charles-Francis-Napoleon, her son, a minor, requests of the justice and magnanimity of the Allied Powers, that the subject of her claims be submitted to the deliberation of Congress; and that an acknowledgment of the present Protest be delivered unto her, in order that she may produce it whenever it may please Divine Providence to afford her time and place for that purpose.

"In faith of which, and to give all due authenticity to the present Protest, she has affixed to it her seal, and written it in her own hand, at the Palace of Schönbrunn, February 19, 1815. MARIA-LOUISA, Imperatrice."

"The High Powers assembled at Congress, after having deliberated, in their sitting of the 24th February, on the present Reclamation of her Imperial Majesty Maria-Louisa; conformably to the opinion of his Imperial Majesty the Emperor of all the Russias, of his Imperial and Royal Majesty the Emperor of Austria, the Father of her Imperial and Royal Majesty the Empress Maria-Louisa, and from the respect due to the personal character of her Majesty the Empress; have resolved, that the Act emanated from her the 19th February, commencing with the words "Maria-Louisa," and ending by those, "written it in her own hand," shall be inscribed in the Protocole of the Acts of the Congress." The French Ministers, having protested against this decision, abstained from signing it.

The date of the above document will not escape notice; it was only a week previous to the day on which Napoleon embarked; and, within a week of its being acknowledged and authenticated by the Congress, the emperor was again upon French ground.

It has been much disputed in France whether Napoleon took the determination of returning from Elba of his own accord, or by the invitation of a party. The royalists, who are almost all sticklers for the latter assertion, were not a little mortified that the trials of Ney, Labedoyère, Drouot, and others, offered nothing to confirm their favourite hypothesis; and the partisans of Napoleon positively asserted that there was no regular conspiracy formed for aiding him in his invasion of France. Carnot declared that he had held no communication with Elba, nor was he aware that any had been held; Labedoyère affirmed that "he had no sort of intercourse with the Isle of Elba; that he had never been present at any meeting in which the recall of Bonaparte had been agitated; that he had often heard vague suggestions, and some expressions of discontent, but he knew nothing of any determined plan." Of the superior officers who attended the ex-emperor in Elba, the principal were Bertrand and Drouot. The latter (a very different person from Drouot comte d'Erlon) is comparatively little known in this country: but we would advise those of our readers, who feel an interest in the real circumstances of Bonaparte's return from Elba, to peruse the trial of Drouot, 6th of April, 1816; where they will find that this officer was unfriendly to the attempt; and that, amid all the applications made to him for favour in Bonaparte's second reign, no one founded a claim on a secret correspondence with that island.

Mr. Hobhouse, who resided at Paris during "the hundred days," writes upon this subject as follows: "Having taken considerable pains to ascertain the fact, I am come into that persuasion which prevails most generally amongst those who have the reputation of being the best informed; which is, that there was no corresponding scheme laid at Paris for this restoration, and that the whole project and execution are to be attributed solely to the daring determination of Napoleon himself to recover his crown, most happily coinciding with the actual condition and general feeling of France. What was that condition and that general feeling, it is likely that the exile at Elba well knew. He might be informed of this even by the public papers, had he not been possessed of correspondents at Paris and agents at Naples. But what I mean to assert is, that there was no conspiracy in France corresponding with the disembarkation

disembarkation at Cannes. The grand marshal Bertrand, the *preux chevalier* of Europe, gave his word and honour to an English gentleman only yesterday, that no such conspiracy existed; and that three weeks before their quitting Elba not the least idea was entertained of the design. The emperor himself, whose assurance you may receive with suspicion, told Mr. S—— as much in a conversation he had with him in the garden of the Elysée; and, on being complimented on the performance of this, the greatest of all his actions, he said, No, it was easier than you think; my only merit was making a good guess as to the actual situation of France."

To this we may add the testimony of M. de Chaboulon, who has recently published *Memoirs of the Private Life of Napoleon in 1815*. He introduces the narrative of an officer whom he calls Colonel Z——, who appears to have repaired to Elba in February 1815, and by his report of the state of France to have strengthened the already-conceived intention of Bonaparte to hazard a return. The authenticity of this narrative must rest on the credibility of M. de Chaboulon, for Col. Z. is represented as having fallen at Waterloo: but we see no reason for suspecting imposition in what is related either of him personally, or of the conversations which Napoleon held with him; from which it appears that the ex-emperor reasoned as follows: "I consider it as certain that the kings who have fought against me are no longer guided by the same unity, the same views, the same interests. The emperor Alexander must esteem me: he must be able to estimate the difference which exists between Louis XVIII. and myself. I could give him Poland, and a great deal more, if he wished it: he knows that I have been always more inclined to tolerate his ambition than to restrain it. Prussia and the petty kings of the Rhenish Confederation will follow the lot cast by Russia. If I had Austria on my side, she would secure me all the second-rate powers. As to the Austrians, I do not know what they would do: they have never treated me candidly. I suppose I could keep Austria in order by threatening to deprive her of Italy. Italy is yet very grateful to me, and much attached to me: if I were to ask that country for an hundred thousand men, and five millions of money, I should have the men and the money. If they were to force me to make war, I could easily revolutionize the Italians: I would grant them whatever they might wish, independence or Eugene. Murat is ours: he has little brains: he has nothing but hand and heart: but his wife will guide him. As to England, we should have shaken hands from Dover to Calais, if Mr. Fox had lived: but, as long as that country continues to be governed by the principles and passions of Mr. Pitt, we must always be as hostile as fire and water. From England I expect no quarter, no truce. England knows, that, the instant I place my foot in France, her influence will be driven back across the seas."

In order to complete the arrangements for his departure from Elba, Napoleon purchased some small feluccas at Genoa, some ammunition at Naples, and a few arms at Algiers. On the 25th of February, 1815, he presided at a fête which he gave to his liliputian court, and was observed unusually cheerful and affable. On the following day, he reviewed his little army; and, at their dismissal, ordered them to prepare for immediate service, and to assemble on the same parade at six o'clock in the evening. Accordingly, the troops assembled at the time appointed, when Napoleon made his appearance, and, forming them into a hollow square, placed himself in their centre, and unfolded to them his purposes and views. He then represented to them, in that military and popular eloquence by which he was so peculiarly characterized, and to which he owed so much of his former influence over the minds of his followers, that fortune now afforded them an opportunity to prove themselves worthy of that estimation in which he had always held them; that it had been the consolation and delight of his retirement to form

them to the discipline and noble daring of soldiers; that the time was at hand in which they might show that his labours were not lost; that France, Belgium, and Italy, invited him to resume the imperial crown; and that he had only to effect his landing, and display his standard, and the whole military of France would obey his summons; and rally round their emperor; that he had been compelled to abdicate the sovereignty, not by the will of the French, but by an overwhelming foreign force which untoward circumstances had formed into a coalition, and to which coalition the calamities of war had given a temporary success; that that coalition had been dissolved by the divisions, the jealousies, and the narrow and personal views, of its members; that Italy was deceived, Germany sacrificed, Poland enslaved, Saxony extinguished, and Russia, Prussia, and England, the dividers of the spoil; that France had now recovered the 300,000 men whom the cruelty of the season had rendered prisoners to Russia; that, persecuted by the Bourbon government, they now wandered destitute through France, and that their well-known attachment to his person was rewarded with insult and beggary. "And will not these men," he continued, "return to the general who remembers them as ardently as he is remembered by them?" "Fellow Soldiers! comrades in glory and in arms! for such you are about to become, judge of them as you would judge of yourselves; and answer me from your own feelings, whether my brave soldiers will pass over to my enemy and theirs, or whether, again seeing my standard shining in the sun, and my imperial eagle again elevated to its own skies, they will reseek their standard, their eagle, and their general, and again conduct them to the throne which belongs to them. What are the Bourbons to them or us? Who in France, still in the vigour of his life, remembers them, or knows any thing of them, but their name, their mad extravagance, and their contemptible debaucheries? In the course of three hundred years did they add an acre to the French territory, or an unit to the lasting glory of the French name? Are these kings for the French? No, comrades! the age and the people demand another kind of leaders. What say you, soldiers? are you prepared to follow me, and to partake my fortune, my glory, and, if there be any, my perils and labours?"

The soldiers answered this harangue by the most enthusiastic acclamations. Napoleon immediately placed himself at their head, and conducted them to the place of embarkation. His whole force amounted to 1140 men; viz. 700 men of his old guard, 300 Corsicans, and 140 Poles: his fleet consisted of a brig, l'*Inconstant*, mounting 26 guns, and six small transports. To invade a kingdom, containing upwards of 28,000,000 of souls, with this small force, at first sight certainly appeared a most desperate undertaking. But Napoleon calculated on the ascendancy of his name over the army, and the terror with which it inspired the peaceable citizens: he reckoned on the stupor which great novelty produces, and that perplexity and confusion which seize the mind when suddenly struck by some bold and unexpected enterprise.

At eight o'clock on the evening of the 26th, the little army was embarked. The firing of a cannon gave the signal of departure; and they sailed from the harbour, enthusiastically shouting "Paris or death!" The night was clear and beautiful, the wind favourable, and fortune seemed to smile on the enterprise. Sir Neil Campbell was in Italy; no cruiser appeared in sight; and, before the dawn, they hoped to double the island of Capraia, and to be completely out of danger from the vessels which were known to be cruising off that station. But the wind, which at first wafted them gaily on, gradually died away. At day-break they had made only six leagues progress, and were yet between Capraia and Elba. To add to their vexation, some vessels were seen in the offing, of sufficient force to annihilate their diminutive fleet. The danger was imminent. The captain and the greater part of the crew advised and urged a return to Porto Ferrajo. But Napoleon

leon was resolute. "He had set his life upon a cast, and he would stand the die." He expressed his determination, if overtaken by the cruisers, which consisted of two French frigates and a brig, first to declare himself, and try the influence of his name. He doubted not that they would immediately hail him with acclamations, and hoist the tri-coloured flag. Should they prove faithful to the oath which they had taken to Louis, he would rely on the tried courage of his veteran guard, and attempt to carry them by boarding. They did not however appear to observe him.

Napoleon had long and successfully manœuvred to lull all suspicion which the appearance of his little fleet might occasion. He often went on-board the English ships of war. He made frequent excursions to the neighbouring islands. His own brig, and another which he bought, had sailed to Genoa and Leghorn. The English and French cruisers were thus accustomed to meet his flag, and therefore paid no attention to it at present.

Towards noon the wind freshened a little, and at four in the afternoon they were off Leghorn. One of the frigates was now about five leagues to the leeward, and the other was on the coast of Corsica: but a ship of war was coming up before the wind to meet the brig. It seemed of nearly equal force. A consultation was held; and it was resolved, first, to attempt to deceive the cruiser, and, should that fail, immediately to board her. The soldiers were concealed between the decks, and the two vessels ran along-side of each other.

The cruiser proved to be the *Zephyr*, captain Andrieux, a man of known talents and tried patriotism. Tallade, a lieutenant of the *Inconstant*, was personally known to him, and undertook to carry on the conference. Assuming a careless tone he hailed the *Zephyr*, and demanded whither she was bound. It was answered "To Livornia." Andrieux then enquired in his turn whither the *Inconstant* was proceeding. Tallade replied without hesitation, "To Genoa," and offered to undertake any commission which Andrieux might have to execute. At the same time, he invited him on-board the *Inconstant*, to spend a few hours with an old messmate. Andrieux was completely imposed upon; and, thanking the lieutenant for his civility, but excusing himself on account of want of time, sailed on; and the two brigs were soon out of sight of each other.

During the night of the 27th the wind continued to freshen; and, at day-break on the 28th, a seventy-four gun ship was seen at a distance of four leagues, making for St. Florent, or Sardinia. It either did not perceive, or did not think it necessary to hail, the little flotilla. At seven in the morning of the 28th, they discovered the coast of Noli; at noon, Antibes was in sight; and at three o'clock in the morning of the 1st of March, they entered the gulf of Juan, at a short distance from Frejus, in the department of the Var.

Previous to the disembarkation, Napoleon mustered his troops on deck, and, ordering them to throw the cockade of Elba into the sea, presented them with the national colours. They were received amid the shouts of "The emperor for ever."

A captain of the guard, with twenty-five men, was disembarked to take possession of a small battery, which might have annoyed the landing of the troops. It was found completely unoccupied. In the afternoon Napoleon disembarked the whole of his troops; and, as he again set foot on the French territory, exclaimed with exultation, "There is an end of the Congress."

An officer, with twenty-five men, was now dispatched to Antibes, to invite general Corfin, the governor of the place, to join Napoleon; and this invitation was accompanied by the most seducing offers. But the commandant rejected the overture with contempt, imprisoned the officer and his men, and hastened to prepare the most vigorous defence. This failure, at the very outset of his expedition, chagrined and terrified the invader: he could not conceal his vexation. Another officer was soon dis-

patched to regularly summon the place in the name of the emperor. He was arrested and thrown into prison. A third emissary presented himself to reclaim the prisoners, and to command general Corfin, under the most dreadful threats of military punishment, to repair to the gulf of Juan with the civil authorities. He likewise was detained.

Irresolute what plan to pursue, Napoleon bivouacked on the sea-side, in a vineyard surrounded by olive-trees; but, reflecting on the consequences of this repulse, and the necessity of proceeding before the news of it had spread through the country, and encouraged others to follow the example of Corfin, he commenced his march at one o'clock in the morning, and, leaving Antibes unmolested, proceeded to Cannes.

His unexpected appearance produced a sentiment of mingled astonishment, fear, and joy. The recollections attached to that name, which the most romantic enterprises, the most heroic exploits, services the most signal, and establishments the most useful, vices unparalleled, and actions unspeakably atrocious, had contributed to render so celebrated; all these recollections, in which horror was mingled with admiration, and hope with terror, produced at Cannes, and in the whole of the country which he traversed, a scene of magical illusion easier to comprehend than to describe.

Continuing his progress to Grasse, he found the town deserted. A report had been spread that a troop of corsairs had landed and were ravaging the country; but the fears of the populace dissipated as soon as they had learned the truth. The mayor was required to furnish rations for the followers of Napoleon. He nobly replied, that he acknowledged no authority but that of Louis XVIII. The inhabitants, however, returning in crowds, opened their shops and were easily induced to supply the wants of the soldiers. He left here the six pieces of cannon which he had brought from Elba, finding that they incommoded and retarded his march.

At four o'clock in the afternoon he arrived at the village of Cérénon, having travelled twenty leagues in the first day. On the 3d of March he slept at Barenne, and on the 4th at Digne; which last, being a town of some size, afforded him the means of printing two proclamations, which he dated from his landing-place, the Gulf of Juan, March 1, 1815.

The news of the landing of Bonaparte was known at Marseilles on the same day; and, if a body of troops had been immediately dispatched, his progress might have been intercepted. The national guards and many volunteers were eager to march; but Massena, who commanded the garrison of Marseilles, could not be induced to take any decisive steps. On the third day, however, when the invader had penetrated eighty miles into the country, one regiment was sent in pursuit.

At Digne, as at Cannes, the peasants flocked from every quarter, and manifested their sentiments with an energy that no longer left any doubt of the real feelings of this part of the population. The fear of losing the emigrant property, which they had purchased at one-third of its value, and of again becoming subject to their feudal masters, had alienated the affections of the peasants from their legitimate sovereign.

Leaving the main body of his troops behind, who were unable to keep pace with the rapidity of his march, he proceeded with only ten horsemen and forty grenadiers, and, on the 5th, arrived at Gap. Here he issued his proclamations, thousands of which were quickly dispersed through the country.

On the 6th, Napoleon hastened towards Grenoble. As he passed through St. Bonnet, with his advanced-guard, the inhabitants proposed to ring the tocsin, to assemble the villagers, and accompany him in a mass. "No!" replied he; "your sentiments prove to me that I have not deceived myself, and they afford me a sure pledge of the sentiments of my soldiers. I do not need your services,

and will not drag you from your homes. Those whom I meet will range themselves on my side; and the more numerous they are, the more certain will be my success."

That evening he slept at Gap, but his advanced-guard was ordered to proceed during the night. They reached the village of Mure, where they met the advanced-guard of the troops from Grenoble, who were approaching to oppose the progress of Napoleon. General Cambronne, who commanded the troops of Napoleon, proposed a parley; but he was answered that all communication was forbidden.

As soon as the invader was informed that his progress would be contested, he resolved to put in practice a *ruse-de-guerre*, which, if it was not previously concerted between him and the officers who so soon swelled his ranks, does infinite credit to his talents and his courage. He proceeded towards the royal troops, accompanied only by two or three officers. They consisted of a battalion of the 5th of the line, with a company of sappers and miners, comprising about 800 men. Arriving within pistol-shot, he alighted; and, advancing on the right of the battalion, which apparently only waited the command of its officers to fire upon him, he bared his bosom, and thus addressed them; "Behold me! If there is one soldier among you who wishes to kill his emperor, let him come forward from the ranks and fire upon me." The effect was instantaneous. The arms of every soldier were hurled on the ground and the air resounded with the cries of "The emperor for ever!" The guard and the soldiers rapturously embraced; they eagerly tore off the white cockade, and enthusiastically mounted the national colours. Enchanted with this success, he formed them into a square, and harangued them. "Soldiers! I come with a handful of men to deliver you from the Bourbons, from treason, from feudal tyranny, and from the abuses which they have brought with them. The throne of the Bourbons is illegitimate, because it is contrary to the will of the nation. It exists only in the interests of a few families. Is not this true, comrades?"—"Yes, fire!" exclaimed a grenadier; "you are our emperor, and we will march with you to victory or to death!"

Thus reinforced, he approached Grenoble. The garrison was composed of the seventh and eleventh regiments of the line, the fourth hussars, and the fourth of artillery. This was the very regiment in which, twenty-five years before, Napoleon had commenced his military career, and in which his memory was yet idolized.

The seventh was commanded by colonel Labedoyère, who had lately received his appointment from the king, and the decoration of the legion of honour. He participated in the general dissatisfaction arising from the inactivity and supposed disgrace of the army, and the threatened subversion of the constitution. He had nothing personally to complain of. He had no connexion with the conspiracy, and shared in the general surprise when the landing of Napoleon was announced; but, "misled by illusions, by recollections, and by false ideas of honour, his country spoke a chimerical language to his heart," and he suddenly resolved to join the cause of the adventurer. His soldiers were too well disposed to second him; and he had scarcely begun to acquaint them with his intentions and wishes, when he was interrupted by the shout of "The emperor for ever!" He allowed them no time for reflection; but, fixing an eagle on a willow branch, he hastened to effect his purpose.

The disaffection of Labedoyère was the signal for general revolt. It ought not, perhaps, to be said, that "had he remained firm to his duty, the atrocious project of Bonaparte would have failed, and France would not have been conducted to the brink of a precipice, the depth of which one trembles to fathom." The whole army was ripe for revolt; and it is probable that not a single battalion could have been induced to fire on their former leader. It is however certain, that the treason of

Labedoyère seduced those who were wavering, and assured the success of the conspiracy.

His forces being nearly doubled by the addition of Labedoyère's regiment, Napoleon fearlessly advanced towards Grenoble, and at nine o'clock in the evening arrived at the suburbs. The gates were shut; and the ramparts were lined by the troops which composed the garrison, whom the commandant, general Marchand, was vainly exhorting to resist the invader. The keys were formally demanded. It was answered that Marchand had carried them away. Some little delay occurring, a tumultuous movement took place among the troops and the inhabitants who filled the ramparts. Napoleon was recognized at a little distance. The intelligence was communicated with the rapidity of lightning. A sudden shout burst from every lip; and the cannoneers, who stood at their pieces with lighted matches, extinguished them in an instant, and joined in the acclamations. The engineers of Napoleon now prepared to force the gates. They had scarcely commenced their operations, when the whole garrison threw down their arms, trampled the white cockade under foot, and, rushing to the gates, tore them open. Napoleon entered Grenoble at ten o'clock, amidst an immense crowd composed of the populace and the soldiers, who thronged from every quarter eager to gaze upon him, and salute him emperor.

It was remarked, that in a few minutes every soldier had mounted the tri-coloured cockade. These cockades were not new; neither were they supplied by Napoleon, nor purchased at Grenoble; they were the old colours under which they had formerly marched to victory, and which they had carefully concealed at the bottom of their knapsacks. The tattered and faded ribbands were shown with enthusiasm: "See," cried the infatuated soldiers, "they are the same which we wore at Austerlitz and at Marengo!"

The mayor and civil authorities now presented themselves, and wished to conduct him to the government-house; but he declined their civility, and proceeded to the hotel of the Three Dolphins, which was kept by one of his old soldiers to whom he had formerly been much attached. He had scarcely taken possession of his apartments, when the approach of an innumerable crowd, uttering some unintelligible shouts, drew him to the balcony. The whole population of Grenoble was dragging along the remains of the gate of Bonne through which he had entered. "We were not permitted," cried they, "to present you with the keys; but, instead of them, here are the gates."
